THE BUILDERS'  
JOURNAL  
AND ARCHITECTURAL RECORD

APPEALING TO THOSE ENGAGED IN

THE ART OF BUILDING

*IT is our aim, our ambition, our aspiration even, to build our Journal worthily and well, not for the hour only, but for future years; for the few men in the forefront of an enduring and a laborious Art; for the disciplined ranks of a distinguished Profession; for the young men—Architects to be—and for all who love a clustered column or a flying buttress, a traceried window or a Greek frieze, for the man, too, who honestly plumbs a jamb.*

EFFINGHAM HOUSE

ARUNDEL STREET STRAND

### The Recent Academy Elections and the Art of Alfred Parsons.

WE have commented elsewhere on the result of these elections, and

we return to the subject again to note one or two considerations in connection with it which we think have been overlooked in other pages. The first is that, as an achievement by the Royal Academy, it stands almost alone in the history of that body. It is probably the first time the Academy has ever elected three artists at one time. To reverse Mr. Whistler's famous saying, the "Artists" have gone in, and the "Britons" stay out. It is quite a pleasure to reflect upon such an unique exhibition. Of course, someone has had the usual amusing idea to ventilate, and this time it is that, because two of the three vacancies have been filled by Americans, therefore this must be a sort of sop to "our cousins across the water"—a Royal Academical endorsement of the recent Peace treaty. A very ingenious explanation, but one not very complimentary to the Artists interested. We prefer to believe, curious and astonishing as it doubtless sounds, that the Royal Academy has, for once at least, elected these gentlemen on purely artistic grounds, and it being undoubtedly so, it is worth more than a passing note. Mr. Sargeant is one of the most brilliant portrait-painters of his generation, and entirely deserves his position. Mr. Shannon has done admirable and beautiful work, and his election comes not a day too soon. But to our minds the tribute to the genius of Mr. Parsons is the best deserved—certainly of the two new Associates, even if history does not ultimately prove, as we think it will, that it is one of the wisest things the Academy has ever done. For we have in Mr. Parsons a painter of landscape almost without a rival. To those who know such works of his as "When Nature painted all things gay" (which was purchased under the terms of the Chantrey bequest, and is now in the South Kensington Museum), or are familiar with any one of his famous paintings in the Exhibitions of the Royal Academy, this fact need not be dwelt upon. There is, however, one side of his paintings upon which we should like to dwell, and that is his perfect rendering of English skies. If, as some critic once remarked, his treatment of landscape is at times apt to be somewhat photographic, this criticism can never be applied to his painting of what Mrs. Meynell calls "celestial scenery." It is doubtless because Mr. Parsons values so much the scenery of the skies that he emphasises the importance of it in his paintings. And he is right; it is so often forgotten that we have above us at all times, save perhaps occasionally in foggy and grimy London—far finer pictures than are to be found anywhere on earth. And the "celestial scenery" has this advantage, that you have no travels to take, no journeys to endure in order to enjoy it. It is here at our own windows if we will but raise our heads and look. It is never wearisome, because it is never the same. It comes to you and varies its pictures for your enjoyment, as earthly scenery never does. Few windows are debarr'd from these wonderful pictures; all or nearly all inclose and frame them. Our own is as commonplace and as ordinary a one as you like; yet as we write there is to be seen through it a perfectly marvellous combination

of colour and cloud form, and a picture is there now that Turner would have envied. Through this commonplace window (it is true we are writing in the country, away in the distance, dim and indistinct, is a range of snow-topped mountains (to be sure they are nothing but clouds) with wreaths of faint blue vapour curving through them, far lovelier than anything you would see in Switzerland or in Spain. The "terrestrial scenery," to again borrow from Mrs. Meynell's delightful prose, itself depends for life and movement upon the clouds above, and the greatest changes upon it, the change from spring to summer, from autumn to winter, are only small compared with that with which it is constantly endowed from the heights. These are things which are never forgotten by Mr. Parsons. Study one of his landscapes and notice the subdued brightness and light of an afternoon's sun across some fair English

few years ago, and which, more recently, have been republished in book form. To those Art students and general readers of our paper who wish to refer to his pen work for the purposes of study, we cannot do better than refer them to these drawings, which are typical examples of his work. In nearly every month, however, many of his drawings are to be found, both in wash and in pen, and they are ever a source of interest, instruction, and delight. From among so many it is difficult to speak of any one in particular, but there were a series he did in illustrations of Blackmore's "Springhaven," which deserve a special word. These also appeared in "Harpers' Magazine," and are admirable examples of his versatility and power. They are quite different in treatment and expression from those we have just mentioned, and should be compared with them in order to properly appreciate his genius.

"GRIM GUARDIANS" ON OXFORD MUNICIPAL BUILDINGS, CARVED IN STONE:  
BY W. AUMONIER.

valley; how he has obscured and dimmed it by a fleeting, purple, vaporous cloud, giving the whole picture at once the romance and charm of mystery. But it is not as a painter of skies alone that Mr. Parsons excels. He is one of the most refined and exquisite illustrators in black and white in England. His election is a tribute to the importance of the illustrator in the Art-world of to-day. No better pen-drawings had been produced at any time than those delightful series of pictures Mr. Parsons made in conjunction with his friend and fellow Associate, Mr. E. A. Abbey, illustrating "Old English Songs," "A Quiet Life," and "The Vicar," which appeared in "Harpers' Magazine" a

Neither should his extraordinary and beautiful decorative work be omitted in the comparison. The studies of flowers and plants which have formed many a head and tail-piece in the magazine just mentioned, are characterised by a keen observation and knowledge of plant life and form which is simply marvellous. These are drawings which rival Durer, and have no equal in their way anywhere. No man has surely ever better deserved his election than Mr. Parsons. Certainly no one has conferred more distinction upon the body which has elected him. Indeed, we do not consider that it is an honour to him at all. His fame would have been just as enduring

without the recognition of the Academy. Was Albert Moore the worse for the loss? or is Mr. Whistler. But the Academy itself, it is safe to say, is the better and the stronger for his sympathy and support. Moreover, his election encourages the hope that this may be the dawn of better things, and of the Academical recognition of the illustrator as an Artist equal to the Painter, Sculptor, and Architect that soon we may find such men as Phil May within the charmed circle.

### RESTORATION OF CANTERBURY CATHEDRAL.

THE restoration at Canterbury Cathedral is progressing. What was ordered to be done in the crypt is now quite complete, and there is some talk of re-opening in course of a very short time, but nothing appears to be actually settled as yet. The carving and decorations have been treated with care and almost veneration, but the course which was unfortunately pursued of cleaning the plain work of the columns and groins with stone grit, gives a garish effect, as compared with which mere whitewashing would be almost dull and subdued. This effect will, however, wear off in time, and as the fabric here does not seem to have been tampered with or injured in any worse sense, it may be tolerated for awhile, looking to the sharp, clear view it enables us to obtain to and from one point or another of this wondrous substructure. Within the Chapter House the works decided upon are being rapidly proceeded with. A

DOOR PANEL, CARVED BY W. AUMONIER.

substantial scaffolding, in which some 600 poles were used, was erected by Thompson, of Peterborough, who has this part of the work in hand, and on a thorough examination being made it was found that the fine oak timbers supporting the roof and carrying the ceiling were for the most part sound, notwithstanding

the hundreds of years during which they had done duty, but the ends of some were worm-eaten and decayed, and had to be removed, and new ends spliced on. The panelled and carved oak ceiling, once beautifully embellished, was found to be very badly supported; some of the fastenings had come away, and part was held up by chains.

#### THE WOODWORK

itself was in excellent preservation, as may be guessed when it is stated that the ribs of all the eighty-four panels (each is 7ft. 6in. by 8ft. 3in. in area) were sound, though the panelling in some twenty of them had suffered and needed partial renewal. The faulty timbers having been made good, the ceiling was prized into its proper place from the top of the scaffold and safely secured. Undoubtedly these measures were taken none too soon. The ceiling is now being redecorated in colours and gilding by Mr. A. O. Hemming, of Margaret Street, London. The indications of some of the armorial bearings on the twenty-six shields (thirteen on either side of the bottom range of panels) were sufficiently distinct to enable this to be reproduced without difficulty; in other cases the necessary details were obtained in the Cathedral library. Down below, the masons are making good the

#### DEFECTIVE PLASTER-WORK

of the walls. The arcading of the side walls was found to be in very fair condition, but this cannot be said of the shafts of the columns supporting it. The originals were of Purbeck marble, but a number had partially flaked away, and others had been replaced by shafts of ordinary stone. Every piece of the old marble that can be possibly used is to be replaced, and new Purbeck is to be used, where necessary, in place of the old marble or substituted stone. The carved work at the east end is in the best condition of any in the building, that of the canopy above the ancient choir being in really admirable preservation. It will be some months before the whole of the work within is completed, and the new east window of stained glass (the design of this has not yet been decided upon) put in, but there is a wish to have the building re-opened somewhere about June, when the ceremony will probably be performed by the Prince of Wales.

### ARTS AND CRAFTS SOCIETY OF IRELAND.

SIR ARTHUR VICARS, Ulster King-at-Arms, at the last meeting of this Society, delivered one of a series of lectures, the subject being "Irish Silversmiths' Work, old and new." A large quantity of valuable silver plate, ancient and modern, was displayed. Sir Arthur Vicars said he claimed to possess no particular knowledge of the silversmith's craft. His object was to give a short outline of the origin of the various styles of ecclesiastical and domestic plate, specimens of which were lent to him by Lord Drogheda, Mr. West, Messrs. Waterhouse, Mr. Johnson, and one or two others. He desired to excite an interest in what was Artistic and of good design, as against what was not. The Goldsmiths' Company of Dublin was incorporated in the reign of Charles the First, and was established on a basis similar to that in England. The district in Dublin at the time for work of the class was Christ Church Place. Having mentioned many details in connection with Hall-marks, he referred to pieces of ecclesiastical plate, chalices, and patens, with Latin—some with English—inscriptions on them. The inscriptions stated that the article was presented to such and such a Church, and probably it was made at the time of which it bore date. In the Irish Exhibition, held in London in 1888, a lot of Irish plate, chiefly from Dublin Churches, was exhibited. He took casts in plaster of the Hall-mark on the pieces of Church plate exhibited there, and of the inscriptions. Domestic plate, unless of a comparatively recent date, was without inscriptions. A Guild of Goldsmiths also existed in Cork, and some elegant work was turned out

there. Youghal, Galway, and Waterford had their own marks, and it was highly probable that other towns had them also. In 1783 there was a village, called "New Geneva," near Waterford, where a colony of foreign Protestants established themselves, and amongst them were many Swiss who worked in gold

DOOR PANEL, CARVED BY W. AUMONIER.

and silver. After some years about £30,000 was expended there, the Genevese became discontented and left, and "New Geneva" went down. The lecturer then gave an interesting description of the various

#### FINE SPECIMENS OF CHURCH AND DOMESTIC PLATE

exhibited, belonging to periods from the thirteenth century to modern times. He stated that in London, years ago, an attempt was made to run down Irish workmanship, but the Irishmen in the trade defended their own Art and Design, and the result was that now a specimen of Irish Art in silver, which some years ago would not bring more than £8 or £10, would now bring from £80 to £100. He could not speak with any authority on the progress made in Ireland within recent years in other Arts and Crafts, but he could most positively say that the silversmiths' craft in Ireland was progressing, and had shown marked advance in recent years; and if they could only keep before them the maxim of good design and conception, there was no reason why the Irish silversmith craftsman should not be able to come up to the standard of former days, if the public, on the other hand, would only ask for work of good design, and "see that they get it."

### SCULPTORS ARCHITECTURE OF THE RENAISSANCE.

Owing to a typographical error the Christian name of Mr. Gilbert, R.A., was given as "Albert," in our last issue. It should, of course, have been "Alfred."

## Men Who Design.

No. 4.

WILLIAM AUMONIER.

THE work of our native wood and stone carvers in the ages when architectural activity was at its height—as plenty of examples still preserved bear witness—was of a degree of excellence equal to the best contemporary work abroad. That to-day the Art is not a flourishing one arises from various causes—to some of which I shall immediately refer—but emphatically not from want of clever and capable craftsmen.

In the first place, there is in Art, as in most other things, a large amount of luck. An artist's opportunities depend largely upon causes beyond his control. The great crafts-

man who is so fortunate as to be born in a building age, with mighty fabrics in progress that are to give delight and cause wonder to countless future generations, is able to grapple with opportunities that give full scope to every whit of artistic power and possibility that is in him. Wren's opportunity was brought him by the great Fire of London, and it seems safe to say that we should never have known the highest expressions of the genius of Raphael if he had not chanced to live under Popes Julius II. and Leo XIII., whose splendid extravagance and restless ambition brought about the execution of the immortal frescoes of the Vatican.

Less fortunate artists who find themselves capable of great things, yet in an age of small ones, must just do their best under the conditions, recollecting that mere size has nothing whatever to do with Art, though it has (alas!) with Fame.

The fortunes of architectural carving are naturally bound up with those of architecture. It undergoes the vicissitudes, and suffers from the conditions experienced by the mother Art. Consequently, at a time like the present, the craftsman, through no fault of his own, is seriously handicapped in comparison with his predecessors. The nineteenth century has evolved no prevailing style. Chaos, or at least personal predilections and preferences, hold the field. In days when some one architectural order was all prevailing, in which men believed, and to which they brought their undivided enthusiasm, their work inevitably gained from thought and study being focussed upon one theme, instead of being diffused over many. But our present purpose is not so

much to bewail the conditions that environ modern craftsmanship, as to show how finely, in the person of one of its representatives, Mr. William Aumonier, it has grappled with them. The first thought that strikes one after an inspection of Mr. Aumonier's workshops at New Inn Yard, Tottenham Court Road, is of the wide catholicity of taste and long study that the work in hand implies in its controlling mind. For many years Mr. Aumonier himself worked at the carver's bench with gouge and chisel, but the expansion of his business has rendered that impossible. But everything is produced by the skilled Craftsmen he has gathered round him from his own designs and under his own eye, assisted by his two sons, Mr. William Aumonier, jun., and Mr. Percy Aumonier, the latter of whom has evinced tastes for decoration in colour, which his father wisely encourages.

Mr. Aumonier's success is to be attributed to the high artistic ideals that he has set himself in all his work. Whatever the nature of the commission he has in hand, he always endeavours to infuse his own individuality into its execution. Admitting that he is compelled to follow tradition, he reserves and exercises his prerogative, in details and views of treatment—by subtle differences of height, by effects of light and shade—to follow it in his own manner. That is to say, that he has the proper self-respect every artist should have. His method of study is always to go direct to the old work and make his own drawings, instead of trusting to the sketches of other men, thereby endeavouring to catch the spirit of the old craftsman. Again, Mr. Aumonier, if he can help it, never models the designs for his craftsmen to carve in wood, but supplies simply a charcoal drawing of the subject, holding that this saves the carver from becoming merely a mechanical copyist, and allows him scope for treating the execution in his own way. Some of Mr. Aumonier's views upon his Art may be gathered from the following extracts from a speech delivered at a meeting of the Royal Institute of British Architects last year: "The wood-carver in the past was evolved out of the village carpenter, as is seen in the choppy, vigorous cut of the Chester and Ambrosio work at Milan, the carver having only just emerged from the use of the chisel proper to take up the carver's gouge." After referring to the possibilities of beauty in the treatment of wood, and pointing out the error of trying to make it represent

good workman he will combine freshness and grace; freshness, because the work grows under his own hand, showing the cuts and gouge marks in it fearlessly to the last, to

ENTRANCE TO THE STUDIO.

mark for ever the secret of its birth, like the last strokes of the painter's brush; grace, because there is no form the artistic mind can conceive but may be obtained in wood, if honestly sought after."

An idea of the range of Mr. Aumonier's work will be gathered from the illustrations of some of his more recent achievements accompanying this article. The Gothic stone carvings of the Oxford Municipal Buildings were modelled upon the spot by Mr. W. Aumonier, jun. The spirit and vigour shown in the execution, and the grasp of the style displayed in the design of these grotesques are simply surprising, and serve to show of what our modern craftsmanship is capable. Here are all that quaint combination of the decorative and monstrous that naïf delight in the realisation of the purely imaginary, that we are sometimes told belonged solely to the mediæval craftsmen, and stand comparison with works like the devils of Notre Dame or the gargoyles on the Abbeys at Caen. The new Victoria Law Courts at Birmingham have provided Mr. Aumonier with an opportunity for some of his best work, and the two fireplaces, modelled in terra cotta (here illus-

PANELS FOR CHIMNEY-PIECE, DESIGNED AND CARVED BY W. AUMONIER.

other materials, such as marble or bronze, he added: "To this end we want it cut by a strong man, fully alive to the capabilities and susceptibilities of his material. If he is a

trated), are remarkable for the delicate design and finished workmanship upon which the artist legitimately prides himself. The wood-carving of the Bishop's Throne and Sedilia for

ST. PAUL'S CATHEDRAL: THE BISHOP'S-THRONE, DESIGNED BY MESSRS. BODLEY AND GARNER, AND CARVED BY W. AUMONIER.

St. Paul's Cathedral, executed in connection with Messrs. Bodley and Garner, and now in place in the choir, also calls for a word of strong praise. In perfect harmony with the older work of Wren, the design of Mr. Aumonier is at the same time more restrained, more dignified, and more decorative than the ornament of the former, and it is, moreover, exceedingly interesting to examine a piece of English Renaissance work handled by a competent contemporary craftsman.

Mr. Aumonier belongs to an artistic stock, one of his brothers being the well-known member of the Royal Institute of Painters in Water Colours, and another having the direction of Messrs. Woollam Bros.' manufactory of Art wall-papers. Originally French, the family fled from Rouen, in Normandy, after the revocation of the edict of Nantes, and the persecution of the Huguenots, and settled as silk-weavers in Spitalfields.

Mr. William Aumonier was born in Highgate fifty-six years ago. He was first apprenticed in London, proceeding at the age of nineteen to Paris, working both in wood and stone, and for six months he was engaged on the restoration of Amiens Cathedral, under M. Violet le Duc. His first important work was for Messrs. Bodley and Garner, comprising stone and wood carving and plaster modelling for the School Board offices upon the Thames Embankment. Since then, the list of his achievements is a long and honourable one. During the seven-

teen years that he has been in business for himself his commissions include the following, beside those already mentioned:—St. Bride's Church, Fleet Street (wood carving); Basil Champneys, Architect. Newnham College, Cambridge (brick and wood carving); Basil Champneys, Architect. Harrow School (brick and wood carving); Basil Champneys, Architect. SS. Austral and Ophir (Orient Line) (wood carving and modelling); J. J. Stevenson, Architect. Christ's College, Cambridge (stone and wood carving); J. J. Stevenson, Architect. French Protestant Church, Soho (terracotta modelling); Aston Webb, Architect. Bath Municipal Buildings (stone and wood carving); J. M. Brydon, Architect. Chelsea Vestry Hall (stone and wood carving); J. M. Brydon, Architect. Hospital for Women, Euston Road (stone and wood carving); J. M. Brydon, Architect. Lady Margaret Hall Oxford (stone and brick carving); J. M. Brydon, Architect. Glasgow Municipal

Aumonier feels strongly that the way to get the best work from the architectural carver is—in his own words—"for architects to treat him as a brother artist or craftsman, in sympathy with the work in hand, called in to give artistic finish to new buildings, and not as a person out of whom is to be screwed as much work as possible for as small an amount of money as the carver will allow his patrons to give him."

THE congregation of All Saints' Church, Burton-on-Trent, contemplate the erection of a new and permanent edifice at a cost, including endowment, of £20,000. Mr. J. Lambrick, secretary to Messrs. Bass, Ratcliff, and Gretton, has promised, on behalf of the directors, to give 50 per cent. of such a sum as may be received from other sources.

MR. C. J. CROFTS, engineer-in-charge of the important harbour-construction works now being vigorously carried out at Port Natal, has arrived by the Cape mail steamer *Scot* to confer with Sir Charles Hartley and Mr. Wolfe Barry regarding the whole scheme of operations.

THE giant statue of the first Emperor on horseback, with a female figure of Peace leading the steed, has just been removed from the workshop to its destination in Berlin, where it will be formally unveiled on 22nd March. There is still a considerable amount of work to be done before the statue is completed, and, in order to finish it by the date in question, operations will be frequently pursued throughout the night by electric light.

THE executive committee has decided to recommend to the general committee of the Benson Memorial Fund that a sum not exceeding £2500 be set apart for the Canterbury monument, and that the balance of the fund be devoted to some definite portion of Truro Cathedral.

FOLD-STOOL, ST. PAUL'S CATHEDRAL, EXECUTED BY W. AUMONIER FROM THE DESIGN OF MESSRS. BODLEY AND GARNER.

Buildings (stone carving); W. Young, Architect. St. Albans Abbey (stone and wood carving); and many more. He is at present engaged upon the stone carving for the Baths and Winter Gardens at Harrogate, in course of erection from the designs of Mr. J. M. Brydon, who, by the way, has been a supporter of Mr. Aumonier for upwards of twenty-five years.

Although at home in all the branches of his Art, Mr. Aumonier's own predilections are for the Italian and old French Renaissance work. Of both he has collected many fine examples, which are his constant study. One of the most hopeful signs of the present time is the increasing recognition of the status of the craftsman, and Mr.

CARVED PANEL, BY W. AUMONIER, JUN.

### AN UNWRITTEN CHAPTER OF ENGLISH ARCHITECTURAL HISTORY.

BY MR. A. S. FLOWER.

AS the history of English architecture has not yet been written, no apology is due to any particular author for venturing to suggest a few unconsidered trifles for which room might be found in such a work. But to an audience of Architects, an apology for introducing a subject of this kind at the present day, seems very much needed. One is confronted at the outset with the question: Are not all such studies wholly useless and pernicious? Leaders of opinions confidently assure us that they are; and, knowing quite well the disesteem into which historical studies have at present fallen, I hardly dare to occupy your time with matters which so many architects desire to see not merely "relegated," but eternally confined, to limbo. It is simply in obedience to the request of the honorary secretaries that these notes are offered. I could think of no other subject but my own out-of-date and very unfashionable hobby of English Gothic Architecture; but, as shirking the duty, or, as I think I ought to say, declining the honour, seemed out of the question, I took encouragement from a passage in the President's opening address, where he bade us "study the mind in the building, through painstaking measurement and logical reasoning. Find out how and why every joint and form was made. The answer lies hidden in the building." This is just what for a long time I have been trying to do; and I am, therefore, at last acting on our President's advice, in bringing before you the results of some independent research into the history and characteristics of the

#### MEDIEVAL ARCHITECTURE OF ENGLAND.

Waiving then, for the present, the great question as to whether any such studies are to be recommended at all, and assuming, merely as a premise, that a young Architect wishes, for some reason or other, to learn something of the Old Architecture of his country, how can we best assist him? I should like first to quote some old advice given on this subject, which no one here can ever have seen in print. The extracts are lengthy, but

have a bearing on what is to follow. "If you ask how you are to study Architecture, you will probably be told to read up the whole history of the Art in all countries, with formidable lists of names, dates, and dimensions. You will have recommended to you treatises on the orders and styles, on rules of proportion and other arithmetical niceties; and will be further advised to read books on the principles of beauty and taste, and probably much poetical extravagance in addition. . . . However we may define Architecture, we must agree that it is a practical Art, confined by the requirements of utility, the properties of materials, and the laws of mechanics. Therefore in studying it, be practical; put aside all considerations derived from archaeology, sentiment, or association, and simply use your own eyes and your own common-sense; learn by obser-

vation and by reasoning. Ask the buildings themselves why they are as they are, and what is their meaning. Imagine yourself with the builders, asking what they are going to do, and wherefore.

#### SO, WHEN YOU CRITICISE,

you will neither praise a building because it is correct or classical, or reminds you of something which you have admired elsewhere; nor will you condemn it because it appears new and strange, or, on the other hand, familiar and unoriginal; you will simply consider, is it good in itself, that is, is it well fitted for its purpose and well adapted to its position, are its materials well chosen and well put together, is it expressive of its object and its construction, does its design show everywhere a striving after beauty. If all this is the case, it is good Architecture; but if one of these

qualities be lacking, though the building may display the most costly and splendid materials, the highest mechanical skill, the most careful workmanship, the most accurate copying of some acknowledged masterpiece, the result, as Architecture, is inevitably bad. To criticise buildings, you must try to grasp the circumstances of their erection, and look at them from the point of view of a constructor. The disposition must be encouraged of thinking of a building as a thing composed of stone, brick, timber, and iron, erected for a definite purpose, and under particular conditions, and not, with the architectural writers of the last three centuries, as merely an affair of lines and conventional proportions and ornaments, quite independent of materials, use, or position, just as if it existed only on paper; nor, with some of our own day, as a thing whose essence is accidental picturesqueness, historic or romantic associations, or the superficial decoration of sculpture, painting, or heraldry. This almost anticipates the new philosophy of

#### ARCHITECTURAL MATERIALISM,

and as we hear so much nowadays against even the use, and not only the abuse, of books in connection with Architecture, I quote these passages from an unpublished paper which I read to an amateur society many years ago. The present subject obliges me to make many references to books, so I wish just to clear the ground, and put myself in order, so to speak, by explaining that, having gone through the phase myself, I quite appreciate the standpoint, and can thoroughly enter into the feelings of certain good friends of mine, fellow members of the Architectural Association, who not only object to any form of book-learning, but even declare, as one quite lately did, that all architectural books ought to be burnt. There is truth, of course, in the idea underlying this—all the books in the world will not make one Architect; but the easy proof of this proposition does not negative nor even weaken another one—namely, that books may be useful to Architects.

Returning to our imaginary student, we tell him, of course, to go out sketching and measuring, and not to neglect to take notes of construction and materials; every one will agree in this advice. He then surmounts, let us suppose, every technical difficulty, until we find him able to draw with the utmost accuracy and most thoroughly artistic touch any subject he may meet with; he has seen and sketched hundreds of buildings, and acquired quite a respectable acreage of details; he can freely reproduce from memory any portion of his

PERFORATED PANELS, CARVED BOTH SIDES: BY W. AUMONIER.

NOTE.—A paper read at the Architectural Association, on Friday last.—ED.

sketch-book; he is, in short, a consummate draughtsman; but there is

#### STILL SOMETHING WANTING.

I am not speaking now of the faculty for design, but simply of that knowledge of the architecture of the past which we are presuming that he desires. Does he really understand these buildings? For all that he has done so far, he may be no more capable of seeing into the ideas and motives of the men who built them than the most prosaic and mercenary photographer. The difference between the two is not necessarily more than one of manual process; the mental attitude of each may be substantially the same. Unaided observation, accompanied by however great technical skill in recording, will not enable a man to read the riddles of ancient buildings. Whenever curiosity begins to be aroused as to how, or when, or why, some particular work was built; whenever, in short, the student wishes to go a stage further, and to know all about what he is sketching, he comes to feel the need of definite guidance; in fact, he has recourse to books. He requires them for several reasons: to learn methods of arranging, connecting, and utilising his own disjointed memoranda; to obtain many indispensable facts, which he could not possibly discover for himself; to bridge over gaps in his own experience; to become acquainted with principles and theories which may throw light on what he has observed, or direct him into fresh fields of inquiry. Books on the history of architecture are not, as is frequently asserted, fetters forged by malign opponents for the enthralment of Art; nor are they simply labour-saving tools to assist lazy men in the mechanical business which they

#### CALL THEIR ART.

Rightly used, they are the means by which an architect may learn the true nature of his Art, its difficulties, its qualities and powers, its grand possibilities. But architectural books lead us at once to the thorny question of styles. "Read a little history," the student is sometimes told, "but steer clear of anything to do with divisions of styles. All Art is one; therefore all Gothic architecture is one, and it is criminal wickedness to attempt to divide it." Advice of this sort in many cases cannot possibly be attributed to any dislike or contempt for the kind of architecture in question. It is principally based, I believe, on a misconception, which it seems worth while trying to explain. In most branches of knowledge, if not in all others, it is generally agreed that sub-division and definition are requisite in order to render learning and teaching possible. "The orderly arrangement," I have seen it expressed, "and classification of its material is necessary to the true advancement of knowledge." Of course, if it has to be conceded that Gothic architecture is a thing by itself, not subject to the common rules of human experience, the argument that methods like those found necessary in other Arts and Sciences can be successfully applied to it, falls to the ground at once. But this those who talk about a one and indivisible style have still to prove. In the meantime, I prefer to believe in the sound old Roman maxim, *Divide et impera*, which may be freely rendered, "By division you will become master." If we suggest, then, that for the sake of a more intimate acquaintance with the character of

#### GOthic BUILDING

the learner should analyse it, should consider its component parts separately and in their relations to one another, instead of only gazing on it as a whole, beautiful but incomprehensible, we must consider the means at his disposal to enable him to grasp his subject. Directions, guideposts, and landmarks innumerable await him; but, unfortunately the greater number of them, and of these the most conspicuous and most generally followed, have been set up on the wrong roads. This is, I believe, the real cause of the distrust now so strongly manifested in all definite study of Gothic. Many men have a vague sense that there is something inadequate, something unsatisfactory, in the orthodox teaching on the

subject, and jump to the conclusion that, therefore, all teaching of it must be wrong and misleading. The idea of improving our present methods does not seem to anyone worth a thought. As it is of no material disadvantage nowadays to an architect to know nothing about Gothic, the elder men either leave it alone, or go on, content with the notions about it remembered from their boyhood, thinking the whole subject so simple, so easily mastered, that everything which could possibly be known about it was long ago finally settled and laid out, cut-and-dried, leaving no room for further research or progress. But this attitude has had results for the younger generation. There are still men, even amongst the youngest of us, who take an interest in our inheritance from the middle ages, and there is besides a much larger, and rapidly growing body outside, who do the same, and who look to us for instruction and guidance. To these architectural students, craftsmen, and amateurs, we have nothing to offer but a confused, incomplete, and largely untrue account of our ancient architecture. Shoals of books, indeed, there are, but all of them, down to the very latest, are but echoes of the imperfect description of Gothic architecture composed, and to a great extent invented, by the antiquarian dilettanti of

#### A HUNDRED YEARS AGO.

Perfectly true and correct echoes of the old voices they may be, as to that there need be no dispute; but the very important consideration, that in so many ways we have now the means of knowing more than even the cleverest of our great grandfathers could possibly attain to, has, in the general treatment of this subject, been most strangely and sadly overlooked. No wonder is it, then, that an intelligent student, turning to the recognised authorities, and, finding himself in a maze of unreal and contradictory statements, often quite at variance with the evident testimony of the buildings as well as with the authentic records of history, becomes utterly disgusted, and is tempted to say, "These things have nothing to do with architecture." Illustrations, of course, have been immensely improved, many new facts and descriptions have been added; but as to all matters of generalisation of principles and of application to practice, we are using a system which is demonstrably absurd, and which deserves to be obsolete. I

speak from a considerable experience of the actual difficulties found in pursuing this subject, which evidently oppress even zealous and hard-working students, and these remarks are entirely prompted by the desire to do something, if possible, towards smoothing the path to a reasonable understanding of it. We have stayed marking time, while in every other branch of knowledge a great advance has taken place, and it is quite time that we should bring ourselves up into line. But the remedy is not to be found in general abuse of antiquaries. Their pioneer work has been of

#### INDISPENSABLE IMPORTANCE.

The fault lies in our having yielded up to them the duty of commanding and directing, which we ought to have exercised ourselves. Hence so many of the generally received ideas about Gothic architecture come from laymen, not from architects, with the natural result that they are thoroughly amateurish, and completely ignore the one thing which we care most about—design. We have forgotten that the proper function of our antiquarian comrades is merely to heave the lead and accurately report the soundings for our information and guidance; and not, in any circumstances, to

set the course or steer the ship. To descend from metaphor to details the lay mind—even in the case of the best educated and the cleverest men—seems incapable of thinking of architecture except only as a species of superficial adornment, applied in an ascending scale of ostentation. Every imaginable question in architectural design is reduced by the average Englishman to the single, and to him all-sufficient, one of comparative richness or plainness. Thus we hear members of Parliament and other typical exponents of public opinion treating all buildings as necessarily falling under one or other of three heads; they must belong, that is to say, to what they term the "plain" or "cheap" style, to the "ornamental" or "expensive" style, or else to the intermediate one generally known as the "handsome" style. Imbued with such ideas, our lay antiquaries, when unfortunately not content with collecting and verifying facts, they took to formulating systems, naturally classified and described all our ancient architecture according to the increasing quantity of ornament, which they supposed they could recognise in

#### SUCCESSIVE PERIODS.

They were practically unanimous in their

SPECIMEN OF BRICK CARVING, MIDDLESEX HOSPITAL,  
BY W. AUMONIER.

division of all Gothic work into early or plain, intermediate or more ornamented, and late or late and profusely ornamented. There was a vast amount of discussion as to the precise terms to be used to express these distinctions, and as to the particular dates at which one should be held to have merged into another, and almost by accident the designation of the latest style, which very nearly settled down into "Florid," has come down to us as the much more architectural "Perpendicular"; but the method all round was the same; not to study the differences of design in the buildings, and trace thence the divers principles which had governed their builders, not to study the social history of the nation, and learn thence the various events which had influenced its modes of building, but to start with a hard and fast, ready-made schedule of three heads, and cut, cram, main, and squeeze so as somehow to get it filled. It was reserved, however, for a later generation, almost our own contemporaries, to carry this tripartite system to absolutely symmetrical perfection, by overriding clear historical facts, and declaring the existence of three separate styles, each exactly contemporaneous with one century of the Gothic age. Complaints of this kind may

perhaps be called unreasonable or hypercritical. The books in common use, one may be told, give us quite as near an approximation to truth as we need either expect or desire. To try, therefore, how far this easy confidence is really justified, I must ask you to consider, as briefly as possible, just one instance of irreconcilable difference between views generally accepted and

#### PLAIN FACTS OF HISTORY.

To quote from a very well-known manual: "The change from one style to another was not immediate; it generally took nearly half a century to effect the transition, and the last half of each of the five centuries was such a period of change or transition. Buildings of the last ten years of a century generally belong in style rather to that which follows." Passing on to particulars our authority further tells us:—"In the fourteenth century the general character is of the style called Decorated; the last half of it is the period of transition from the Decorated to the Perpendicular." Nothing could be more beautifully simple and regular; but nevertheless it used to be a great puzzle to me how, if all this were true, one never met with a "Decorated" building after the middle of the century, while, without any premonitory signs of change, everything after that time was to be found designed on entirely different, indeed, almost opposite, principles. No reaction in taste could by itself account for such a startling change, and from no architectural writer nor any general historian could an explanation of the mystery be obtained; indeed, none of them seemed to recognise the fact. Only after a good deal of search in the by-paths of history did I come across the clue, namely, that the "Decorated" style, after an existence of only some five and thirty years, was suddenly cut short and literally killed by *The Black Death*, that awful pestilence which went near to depopulating England in the years 1348-9. Plagues are disagreeable and unpicturesque subjects, not unnaturally avoided both by historians and artists, but this particular epidemic forms such a

#### MARKED TURNING-POINT

in the artistic as well as the social history of England that it is impossible not to refer it. I believe that anyone who will take the trouble to study the history of these few years will have no difficulty in learning both how it came about that the "Decorated" style never ran its natural course of logical development, and also what were the causes of the special characteristics of its successor.

The chapter of the history of English Gothic architecture which has never yet been written is the one which shall treat of the whole matter on the sole basis of design. No one, except an architect, can write this chapter, but only one, so far as I can discover, has ever fairly essayed it—I refer, of course, to the late Edmund Sharpe. His description of Gothic building is the most architectural one which we possess, and is full of valuable suggestions; but hardly anyone regards it as more than a partial success, and it has certainly not succeeded in supplanting, as its author hoped, the popular amateur version. Sharpe made a bold and original endeavour to place the study of Gothic on better foundations, but his own work was doomed to failure, because it rested only on one particular section of design, and that not in reality the most important. In seeking a key to the

#### UNDERSTANDING OF GOTHIC ARCHITECTURE

in window-tracery alone, and grouping buildings all in accordance with that onestandard, Sharpe showed that, after all, he was, however unconsciously, still under the influence of the amateur school, who saw in tracery, as they do to this day, the principal evidence of that comparative amount of decoration which they dominate "style." But if I rush in where Sharpe failed, if he feared not, to tread, I shall be in danger of the apt quotation of an ancient proverb. If anyone is expecting me to say that I have got the missing chapter in my pocket, I fear he must be disappointed. But over there, in the lantern which our kind

friend Mr. Wonnacott will shortly bring into action, I have collected some material which may suggest to someone how it might be written, and will at any rate, lighten the dullness of my sermon. . . . This first slide is one which I have just had made from an MS. in the British Museum, and I do not know that the subject has ever been exhibited before. It is taken from Matthew Paris's "Life of King Offa" (Cottonian MS. Nero D i). The author and illustrator of this work was, I may perhaps remind you, a Benedictine monk of St. Albans Abbey, who died a few years before King Henry III., and is said to have been equally distinguished as theologian, historian, Artist, poet, and mathematician. The original is an outline drawing in brown ink, measuring about 9in. by 5in., so that the large figures are about 4in. high. The subject is Offa, king of Mercia, directing the building of St. Albans Abbey, and, it is hardly necessary to say, the drawing illustrates a building scene of the days of its author, and not of the remote period which he is describing. Its main interest lies in the fact that we have here an unquestionable contemporary representation of a mediæval architect, together with some important evidence as to his position and methods of work. It is worth while taking note of even the details of this drawing, because some of the most fashionable modern theories about Gothic architecture depends entirely upon the supposed non-existence of architects in the

#### MIDDLE AGES.

It has quite recently been confidently stated, though apparently upon no better grounds than an *a priori* assumption, that "there never was no such person," or that, if there was, he was quite undistinguishable in any way from an ordinary mason. We have been told that he could never, like a degenerate modern architect, have been seen upon the works with his coat on—because he could not have possessed one, nor even in his shirt-sleeves, for a similar reason! Now the man before us, to consider his outward aspect first, is not of this sort. In all particulars of dress and general fashion, he bears a close resemblance to the king and his attendant. So far, too, from looking just the same as any one of the crowd of workmen whom we see engaged in their various handicrafts, he is unmistakably a man of learning and culture, whose work lies in designing and directing, rather than in simple manual labour. He is discussing, on very friendly terms, some point concerning the building with the king; the latter apparently has made some suggestion, but the architect is giving his opinion with no undue show of deference, while the courtier keeps in the background till the question is settled. Even were there no other signs to guide us, this drawing is enough by itself to suggest that a great Gothic building was not, as is so often pretended, a

#### MERE CONCRETION OF MATERIAL,

piled up by the unorganised and undirected labour of many similar units—exactly in the manner of a coral reef—but was, on the contrary, the actual creation of a single intellect, as truly and absolutely so as a play of Shakespeare or an oratorio of Mendelssohn. There is not in reality the slightest disparagement of the other workers who took part in raising such a building in saying that their work could not have come into being without an original mind to give the necessary impulse and control; it is no more than saying that the cleverest actors and the most skilful musicians depend after all for the opportunity of exercising their powers on the previous labour of the individual dramatist and composer. When we know that Matthew Paris not only witnessed important building operations in his own Abbey, but was in great favour with Henry III., and present at his court during the erection of the Abbey Church of Westminster, we may readily imagine that in representing the legendary scene of Offa's foundation of St. Albans, Paris drew upon his recollections of the frequent interviews he must have witnessed between Henry and the Architect of the great Church, in the building

of which the King took such deep and constant interest. But notice also this architect's compasses and square—they denote more than that he is merely an expert in building—they mark the geometrician. This is a point we must return to, after looking at the other slides, views, and details of buildings, selected for special reasons, which, for convenience's sake, must be shown now. . . . To come back now to Matthew Paris's drawing. Here we may find the clue, without which we can never learn to see the mind of the

#### MEDIÆVAL ARCHITECT IN HIS WORK.

He was essentially a geometrician. In the great intellectual movement of the thirteenth century no branch of learning, except theology, was more widely cultivated than geometry; and this science, both then and for long afterwards, occupied an altogether higher position relatively to other intellectual pursuits than it does at the present time. Among the many side-lights which the recognition of this fact seems to throw upon the development of English architecture is one with regard to the vexed question of influence from the East. Most people have at some time felt, if they have not, through lack of tangible proofs, actually allowed, that Oriental suggestions must have played some part in the formation of English Gothic architecture. As an explanation of this, it has generally been loosely asserted that the English crusaders tried to reproduce at home the Saracenic architecture which they had seen and admired in the course of their campaigns; a supposition which, besides being unsupported by a shred of evidence, must seem to any one acquainted with the average military mind, absolutely incredible. But when we think of the highly-prized Arabic geometrical treatises then finding their way into every monastery and university (the latter being at the time thronged by lay scholars, in numbers almost impossible to realise), there is little difficulty in imagining how the subtle influence of books, written by men whom the most learned of Europeans revered as their intellectual masters, became the means by which Oriental inspirations were grafted upon the rising tree of English architecture. Until we can form some idea of the

#### INFLUENCE OF GEOMETRY

during the middle ages, nowhere stronger, I believe, than in our own country; until we can partly realise the fascination in the study and exercise of it which then possessed every educated mind, lay and clerical alike, we shall never be able to understand the conditions under which our Gothic structures were designed. Geometry is the indispensable key to the thoughts of the men who built them; indeed, I will go so far as to say that, were I asked to define English Gothic architecture in the fewest possible words, my definition would be:—"A species of building wherein every part, from the greatest to the least, is dominated by the same geometrical motive?" I beg you to notice, however, that I do not say, simply, "dominated by geometrical motives," nor "by a motive," but "by the same motive." A great deal turns upon this. It will not be at all surprising to hear this definition objected to as being neither new nor true. It may be contended, on the one hand, that everything possible to be said about the connection of geometry with Gothic architecture has been already said; and, on the other, that true Art soars far above the trammels of such a cold, hard,

#### PROSAIC SCIENCE.

Both objections cannot be dealt with together. The former, of course, the less important, may perhaps be sufficiently answered in a few words; but, to establish a case to meet the latter, which I expect would be fervently urged, would require the production of a large body of pictorial and other similar evidence, such as, unfortunately, I am unable to bring before you in the limits of the present paper.

But with regard to my previous references to the relation of geometry to Gothic design. The mention of it at once calls up visions of plans and sections of Churches, crossed over

like maps by squares and triangles, with arguments on the supposed rules of their setting-out, which have rarely succeeded in carrying conviction, chiefly on account of the apparently arbitrary and usually contradictory systems of measurement adopted by rival theorists. It suggests also that much ingenuity has been devoted to one particular class of geometric design by the illustration of the infinite variety of patterns producible from contained and intersecting circles. Nor will it be forgotten that some authorities have gone so far as to speak of a

"GEOMETRICAL PERIOD,"

though only as a shortlived minor division of English Gothic. We may be grateful for hints from all these sources, but they neither exhaust the subject nor give us the information for which we seek. It should be remembered that, owing to the general destruction of our ancient libraries, and the consequent dearth of direct home evidence, people have been implicitly relying upon certain works on proportion which happen to have come down to us from German and Italian architects of the latter part of the fifteenth and of the sixteenth centuries, to explain the principles of English architecture in the thirteenth and fourteenth centuries! To arrive at an understanding of the actual manner in which old English architecture was influenced by geometry, not for a limited time only, but from its birth to its decline; not through any one form or figure only, but through many; not merely generally or at random, but with a single order of forms dominating, as a keynote, each particular era in succession, we must discard many old methods, old prejudices, old associations. We must look for new facts in our own buildings, and for new light upon them from our social history. We must establish our principles solely upon the firm base of observations, instead of stubbornly dogmatising in the old, viscous manner, and mangling facts to make them square with unwarrantable theories. In doing this we may gain even more than truer and fuller knowledge of the past; we may find sure helps and great encouragement for the future.

*The discussion which followed will be published in our next issue.*

## OLD BUILDINGS AND THE STORY THEY TELL.

MR. ARNOLD MITCHELL recently delivered a lecture at Oldham on "Old Buildings and the Story They Tell," and, in giving an account of Peterborough Cathedral, said: It was built in the Middle Ages, and is one of the finest in the country. It has a front distinct from the building itself, built in order to out-rival the appearance of the Cathedral of Ely, not far away. The Dean and Chapter, who are the responsible custodians of the building, consulted experts, who reported that the front wanted restoring. Operations have now commenced, and part of the front is being taken down. Faddists and sentimentalists who had not the responsibility on their shoulders had expressed the opinion that old buildings should be left till they crumbled down. He wanted people to have a more sensible idea than that. It was interesting to note how builders had improved step by step as they passed from one period to another. The evolution of the pointed arch from the semi-circular one, showing the greater beauty of the pointed, owing to the variety of curves that could be made with it, was worth noticing. Excellent views of different Cathedrals were given, showing the passage from Norman to the beautiful early English style of Architecture. Examples of the development of windows of Churches and Cathedrals from the long, narrow slit of the castle-building period to the beautiful tracery windows of more modern dates were interesting. Another set of views showed the capitols of columns from the early style of simple square stone designs to the sculptured ones with their beautiful light and shade effects.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
February 10th, 1897.

*"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."*—JOHN RUSKIN.

At the meeting of the London County Council last week, the report of the General Purposes Committee recommending the appointment of Mr. W. Adams as Manager of the Works Department at a salary of £1500 a year was carried. Mr. Adams has been for twenty years an engineer on the North-Western Railway, and was responsible for the maintenance of the company's London stations. In thanking the Council for his appointment, Mr. Adams said no effort would be spared on his part to make the Works Department a success. From his experience he should say that the Council could do work itself cheaper without a contractor.

FAR more serious consequences than were at first discovered have resulted from the recent experimental explosion of a large quantity of cordite at the Royal Arsenal, Woolwich. A careful examination of the district shows that the effects of the concussion were disastrous to much property there. The ancient Church of St. Nicholas, Plumstead, and half-a-dozen shops were found to be wrecked and hundreds of houses damaged. The Church itself, which is 900 years old, had its latticed windows blown out, the ceiling brought down, and has had to be closed. Three large plate-glass windows and a 6ft. mirror have been smashed at a shop in the Plumstead-road, and the ceilings of a number of dwellings in all parts of the parish have fallen in. The weight of cordite which exploded in the thirteen cylinders was 1400lb. It made a hole 15ft. deep and 12ft. wide, and earth and stones were thrown a distance of a mile: One hundred feet of iron fencing and the telephone wires at the Government butts were demolished.

THE works in progress on the South-Eastern Railway at Waterloo Junction and in Southwark relate to the general scheme for widening the approaches to Charing Cross, Cannon Street, and London Bridge Stations. Some years ago it was seen by the directorate of the railway that provision would have to be made for the increased traffic, both on the suburban feeders of the system and of the main line; and it was decided to construct the necessary widenings by degrees. Parliamentary powers having been obtained in the Sessions of 1882 and 1890, the great railway bridges that cross the Thames from near Waterloo to Charing Cross, and from Bankside, Southwark, to Cannon Street, were widened, and an additional down line run into each of the stations. Other powers were obtained in 1896, and yet more important ones are being sought in the present Session for widenings that will provide two up and two down lines throughout.

MESSRS. DRIVER AND CO., of 4, Whitehall, have let on building lease for a term of eighty years, the site of Hanover Chapel, having a frontage of about 75 feet to Regent-street, and containing an area of 6666 square feet, at the yearly rental value of £2120. This gives a rental value of 6s. 4d. per square foot, and this ground rent, capitalised at thirty years'

purchase (which, we are informed, it will be worth when the buildings are erected), comes out at £415,000, or, approximating half a million per acre.

EARLY in May the south wing of the new medical school buildings at Guy's Hospital, which will shortly be ready for occupation, will be opened by the Prince of Wales. It is satisfactory to learn that this important addition to the hospital has been provided without in any way touching upon the funds of the charity, the sum required for the erection of the building and about £13,000 having been entirely subscribed by the members of the staff and the teachers in the Medical School. The portion of the building which his Royal Highness will open comprise a large lecture theatre and a completely equipped physiological department.

"SHAKESPEARE'S LONDON" was the attractive title of an interesting lecture delivered in Toynbee Hall by Professor Hales. He recommended all students of our great dramatist to gain some knowledge of what our metropolis was when, at the early age of twenty-one, Shakespeare arrived in it. The first regular theatre was erected in 1576, in Shoreditch; then shortly came the Curtain, in the same district. With them, as well as with the Globe, on Bankside, and another in Newington Butts, the young man was connected, and very likely played in inn yards, like that of the Old Bell in Holborn, where the galleries leading to the sleeping rooms made a capital auditorium. Shakespeare's plays had abounding evidence of the interest their author had in the city whose life was the book always open before him. The Tower, London Stone, Smithfield, the Savoy, Ely-place, Tyburn, Old St. Paul's, Blackheath, Mile-end-green, and an immense number of other places in and around the metropolis were graphically commemorated.

THE refusal at a public auction last week of a bid of £57,000 for the site of Cleveland House, at the corner of St. James's-square and King-street, may well give rise to some reflections on the growing value of landed property in London. In 1665, little more than two centuries ago, Charles II. granted a lease in perpetuity of the forty-five acres upon which the square stands, for the annual rental of £80 to Henry Jermyn, Earl of St. Albans. To-day a quarter of an acre cannot be had for less than £60,000. It is clear that aristocratic incomes cannot keep pace with this development. Only successful speculators, and but few of them, are prepared to pay a ground rent of £2000 or £3000 a year, before a stick or stone has been laid of a future mansion. The first occupant of Cleveland House was the unlucky Earl of Essex, Arthur Capel, Viceroy of Ireland, who left its shelter to meet his mysterious fate in the Tower.

GREAT preparations are being made at the back of the Bourse, Paris, for the opening of the new thoroughfare which brings the Rue Réaumur from the Temple district down to the Rue Quatre Septembre, thus forming a splendid straight highway from the Opéra away towards the Place de la République. The dry weather which has come after the snowstorms enables the work of levelling the long street to be carried on with alacrity, but a good deal of time must elapse before the sides of the new urban artery near the Money Market will be presentable, owing to the number of houses which have been pulled down. The Municipality is in the meantime spending a good deal of money on the preparations for the opening of the thoroughfare.

MR. HANBURY recently stated in the House of Commons that the popularity of the National Portrait Gallery was not increasing, and gave as his reason the fact that the number of visitors has decreased from 49,000 in the first month of its opening to 12,000 in December last. This statement may suggest a very erroneous impression. The Gallery was opened in April, and the opening of a new Exhibition naturally attracts a large number of visitors

from curiosity. No reasonable person would expect the attendance in any subsequent month to be anything like so large. Nothing, therefore, could be more absurd than to take the first month as a standard—nothing, except perhaps to take the month of December as affording any fair comparison with a summer month. To begin with, the Gallery is open for eight hours a day in the spring and summer, and only for six in the winter. Secondly, it is now closed entirely on Sundays; during the summer it was open on Sundays. Thirdly, even within the hours of opening during the winter, it is often entirely impossible to see the pictures properly. The parsimony of the Treasury denies to the Gallery any means of artificial lighting, and sometimes the Gallery has in consequence been closed altogether. To argue that the popularity of the Gallery is declining because fewer visitors went in December than in April or May would be about as reasonable as it would be to say that great-coats are declining in popularity because fewer were worn in May last than in the preceding December. The fact is that there are at present no data for any conclusive comparison, for summer cannot yet be compared with summer, nor winter with winter.

A SITE has been acquired at Dartmouth for the Naval Cadets' College. It commands a fine view of the Dart, and is as eligible a place as could be found in that locality. It has been stated that it was not intended to seek architectural assistance outside the department. Admiral Field, however, was informed by the First Lord that an Architect has not yet been selected, but that the Board will not take action without the most able professional assistance which they can secure. The country has a right to expect full value for the money to be expended, and this is only to be secured by employing a thoroughly qualified and experienced Architect to prepare the plans.

A DEPUTATION of the Sheffield Corporation Tramways Committee recently visited a number of towns in the United Kingdom and on the Continent with the object of collecting information as to the merits of various systems of tramway haulage in operation. The deputation now reports to the Tramways Committee that of the forms of traction at present in operation the overhead electric system possesses the most advantages, and is the most suited to the requirements of Sheffield. It is recommended, however, that only certain sections of the tramways should be at present adapted to the system in order that it may be tested.

THE Stirling Fine Art Exhibition, opened last week, has always kept an important position among Scottish Exhibitions. The standard of the works exhibited is an elevated one; and there are few local Exhibitions that can show so many excellent works in a comparatively limited area as those that have been brought together in the Smith Institute, Stirling. A word of praise is due to the Hanging Committee. The practical artists engaged on this part of the work were John Smart, R.S.A., and Wellwood Rattray, A.R.S.A., and it must be allowed that they have hung the pictures with more regard to the intrinsic merits of the works than to the alphabetical decorations attached to the artists' names. Several loan pictures of exceptional merit are shown. The post of honour in the Exhibition has been assigned to a beautiful, full-length, life-size portrait of "Mrs. Graham," by J. J. Shannon, the newly-elected Associate of the Royal Academy. It has been lent from the collection of Mr. Donald Graham, of Airthrey Castle. While the loan pictures certainly give a high tone to the Exhibition, the pictures sent from Scottish studios are by no means to be despised. The Exhibition is certain to be of great service by making the local visitors acquainted with the progress of Art beyond its own circle, it is also of use as bringing before the public the work of young artists who find admission to the large Exhibitions difficult through lack of accommodation. In this Exhibition there are many works that are meritorious in themselves, but which might not have found admittance to the more popular

collections through lack of room, and from the plethora of pictures by artists who have made a name in the Art world.

THE "Secrets of crystals" which Professor Miers disclosed to his audience at the Royal Institution, in the course of his second lecture on the subject, were not of a very startling kind, but they were very pretty and interesting none the less. The most attractive of them were those which exhibited the action of crystals on transmitted light. It is the property of nearly all crystals that they are doubly refracting, which is to say that a ray of light passed into them will be split up by them into two rays, which travel at different speeds through the crystal. In the sapphire this property is exhibited by the different colour of the rays which emerge, one being the sapphire blue as most people recognise the colour, and the other ray being about the colour of indigo. Tourmaline, in the same way, exhibits two shades of green. But if the crystals are submitted to the influence of polarised light, as Professor Miers submitted them, the emergent rays form most symmetrical and beautiful patterns on a screen. Sometimes the pattern is a series of concentric circles about a dark cross; sometimes the dark cross develops into its ultimate form of hyperbolic branches, and the concentric circles become ellipses; sometimes, and this appears to be more often, there are two "eyes" or "foei" of the polarised refractions. Whatever beautiful form the screen-image takes, however, one fact may always be gleaned from it. The image represents, one might say, the interior construction of the crystal; and the degree of symmetry which it exhibits is an accurate representation of the amount of symmetry the crystal possesses in all its physical aspects. Etching a crystal will reveal its form, because any attempt to dissolve the face of a crystal has the result of splitting up the face into a rough surface, which, on examination by a microscope, reveals a number of tiny facets showing the true form of the crystal.

THE Church of S.S. Mary, Andrew, and Thomas à Becket, at Colebrook, contains several rare architectural features, one of them being an ancient font cover. The sculpture thereupon has, in the course of time, been sadly mutilated and defaced, and other damaged parts have been mended with deal and elm, whilst sundry coats of blue and buff paint have been daubed unsparringly upon it by zealous, if all too injudicious, successive ages of churchwardens. This interesting mediæval relic has just been most conservatively restored, at the expense of Mr. A. O. Sillefant, J.P. It is octagonal on plan—spiral, and of ogee outline—well and effectively moulded. The finial assumes the form of an archangel, facing both ways, and with hands (also front and back) in the attitude of devotion; whilst the wings are extended. It has the cross on the forehead, which emblem invariably marks archangels, who, with their leader, St. Michael, wore this symbol when warring with the devil and his angels. The font cover has been restored by Messrs. Harry Hems and Sons, of Exeter, who have also done much other work at the Church from time to time. During the past seven years the edifice has been carefully renovated from the designs of Messrs. Tait and Harvey, Architects, of Exeter, and, although more necessary work remains to be done, the building is now in a fairly presentable condition.

Moscow is now considering plans for an ice palace to be built this winter in imitation of the one which adorned the Empress Anne's reign. That was constructed in 1740, between the Admiralty and the Winter Palace at St. Petersburg, and was formed throughout—walls, roofs, windows, columns, and decorations, in fact, everything from the foundation up—entirely of ice, the evenness of the winter weather there assuring for a term the durability of the masonry. At the entrance to the structure was a large gallery filled with ice statues, and on pedestals of ice stood vases filled with flowers, with hovering birds above them, all of the same materials, as were the

clock-cases, chairs, tables, wardrobes, utensils, candelabras, beds, and all the other furnishings. It is not yet known whether the Architects of the present structure will try to rival the proportions and perfection of the old one, but if they do it will exceed in attractiveness any of the existing edifices of the Russian capital.

AN interesting discovery has recently been made of an underground dwelling or place of refuge of primæval man on the estate of Mr. Ford-Hutchinson at Stranocum, in the county of Antrim. It appears that during some agricultural operations the workmen noticed the falling in of the soil, and, excavating deeper to ascertain the cause, unearthed the entrance to what proved to be a remarkably extensive and well-preserved souterrain. This underground dwelling is remarkable in many ways. It is situated under the south rampart of an old earth-fort of about 300ft. diameter, surrounded on the south-west and north by a deep fosse, the east side being an almost perpendicular descent of 80ft. to the River Bush, which winds round its base. The bend of the river is commanded by a projecting earthwork on the north side. The souterrain is entered by a flight of five well-formed but narrow steps which lead from the original level of the interior of the fort to the floor of the vestibule of the carved dwelling. From this the first chamber extends nearly due south under the rampart for 6ft., by 1ft. 6in. wide and 4ft. high. At the end of this first chamber is a door 4ft. 4in. wide and about 2ft. high, passing which the next chamber at once takes a right angle turn to the east, running for 13½ft., with fairly even dimensions to another and similar door, which leads to a chamber 29ft. 9in. long and 1ft. 8in. wide, and averaging 4ft. 9in. in height. Three feet from the door to this chamber, and on the north side of it, is another and similar door leading to a fine chamber at right angles to it, extending 14ft. northward by 2ft. 8in. wide and 4ft. 10in. high.

At the end of the great east chamber is a small tunnel or passage 2ft high, 18in. wide, and 6ft. long, leading to the outer side of the fort's rampart which seems to have served for the double purpose of an escape for the occupants, if hard pressed, from the main entrance, and also for draining the souterrain, which has a gradual fall of 4ft. to this point. The walls are built of rough boulder stones, and the roof is composed of large flat stones spanning from wall to wall, some of which appear to have been quarried, and in two places there appear to have been vents carried up from the ceiling. The floor is of earth throughout. The only things found in the souterrain were two bones, supposed to belong to a cow, two pieces of iron ore, and a piece of lias limestone. The floor of the rath appears to have been literally covered with rudely paved hearths, which yielded a lot of ash, and several fragments of pottery and a portion of a quern for grinding corn.

It has been decided that the memorial to the late Sir John Pender shall take the following forms, as funds permit: That a bust of Sir John Pender be placed in a suitable institution in London, at a cost not exceeding £500. That a sum of not less than £5000 be placed in trust with the Council of University College, London, to form an endowment fund for the maintenance of the electrical laboratory in that college, on condition that the Council name the laboratory the "Pender Laboratory," and the existing chair of electrical engineering the "Pender Chair of Electrical Engineering." That a "Pender Scholarship and gold medal" in connection with electrical subjects be established in Glasgow.

At the last meeting of the Council of the Royal Society of Antiquaries of Ireland it was proposed by Mr. George Coffey, seconded by Mr. J. J. Digges La Touche, and passed unanimously: That the Council of the Royal Society of Antiquaries of Ireland has heard with regret that a presentment has been passed by the presentment sessions for the liberties of Kilmallock for the purpose of taking down the

King's Castle at Kilmallock. The Council is surprised at the contemplated act of vandalism, inasmuch as the preservation and protection of ancient and historic monuments are recognised as a matter of great public interest, and trust that now public attention has been directed to the subject the presentment will not be proceeded with. The Council would further suggest that steps be immediately taken to place this interesting monument in charge of the Board of Works for protection under the "Ancient Monuments Protection Act."

It is all very well for the Deputy Keeper of the Public Records to make much of the discoveries which have resulted from the demolition of the Chapel of the Rolls, says the *City Press*, but we cannot forget that the destruction of that building was carried out after official assurances had been given that it would not be touched. Very likely we might learn a great deal about the Guildhall and Westminster Abbey if they were to be pulled down, but most people probably prefer the buildings to the knowledge. We have lost Rolls Chapel, and are now in possession of the knowledge purchased with its precious stones. The chapel on the eve of its demolition showed no vestige of mediæval work. The inner plastered roof was but forty years old; the inner walls were plastered throughout; the external ones covered with a thin layer of flint, except where patched with comparatively modern brick; the buttresses were missing or mutilated; the four large windows were devoid of tracery. It was, says the Deputy Keeper, a mean and ugly building, interesting mainly for its monuments and stained glass. The demolition brought to light several relics of the building as it originally stood. Amongst these was a window, apparently *temp.* Edward III., which had been fitted up at an early date (some parts of the mullions were found). Another window (dating from the time of Edward I.), with mutilated jambs and mullions of Caen stone, was also disclosed; this window had been closed up probably in the seventeenth century. A fine chancel arch (*temp.* Henry III.) was discovered. Its existence had never even been suspected. Its base being 2ft. underground, it has been suffered to remain. It is intended to re-erect the stones of the arch in the new building, which will rise on the chapel's site. There were also found buttresses, probably of Henry III.'s reign. Mr. Lyte gives the history of the chapel, which, as is well known, was originally founded by Henry III. for Christianised Jews. The keepers of the House of Converts came also to be keepers of the Rolls of Chancery; hence the name Rolls Chapel. Pennant has stated that Inigo Jones rebuilt the chapel in 1617; this was not so. The seventeenth century reconstruction and mutilation was probably done by way of repair after the Fire of London, which is believed to have damaged the building.

At the last meeting of the L.C.C. the General Purposes Committee proposed the following recommendation: "That Mr. Bull be asked to convey to Mr. Thornycroft the thanks of the Council for his liberal offer in connection with the Boadicea statuary group, but at the same time to inform him that the Council is not in a position to contribute towards the cost of casting the model of the group, or to bind itself to do so hereafter even should Parliamentary power be given for the purpose; and that while the Council will proceed to promote the Bill, it must be understood that any steps which Mr. Thornycroft may take in the matter are taken entirely on his own responsibility." Mr. Roberts moved that the recommendation be referred back. He recommended the Council that Mr. Thornycroft had offered them the statue, which was valued at £20,000. Mr. Bull, one of their members, had collected a large sum towards the sum for casting, and only another £1000 was necessary, which Mr. Thornycroft had offered to provide under certain conditions. It was an illogical position for the Council to take up and refuse the offer. London was sadly wanting in the matter of statues, and the Boadicea statue was such a remarkable and artistic one, that it would be a scandal if the Council threw the

opportunity away. In this Queen's Year it would be particularly appropriate if the statue of the old British warrior Queen was erected in the county of London. Mr. Crooks seconded the amendment, remarking that to lose this opportunity would be nothing short of a calamity. The recommendation was approved.

PRINCIPAL BODINGTON'S lecture to the members of the Leeds Philosophical and Literary Society last week upon "The History of Lanuvium" was of especial interest, in view of the presentation to the society by the late Lord Savile (just before his death) of a valuable collection of antiquities found upon the site of this old Roman city. The town, which is situate about twenty miles due south of Rome, can easily be reached by railway, but in former times access was obtained to it by the Great Appian Way. Lanuvium was built upon a promontory overlooking the Pontine Marshes, and although traces of ancient buildings had always been found there, their character was little known until Lord Savile—then in residence as British Ambassador in Rome—turned to the spot as a most promising field for research. A few of the articles excavated were presented to the British Museum, but the whole of the remainder, said the lecturer, had been given to Leeds, and the value of the collection was enhanced by the unlikelihood of Englishmen being allowed in the future to carry away such antiquarian treasures from foreign countries. Dr. Bodington went on to deal at some length with the historical story of Lanuvium, and, as showing the antiquity of the city, mentioned that a famous shrine which existed there had been proved, by the finding of three terra-cotta heads of a Greek type, to date back to the beginning of the sixth century before Christ—a period within 150 years of the traditional founding of Rome.

THE proposed "Boulevard" for London—namely, Portland-place—should not be compared, as some are now doing, to a Paris boulevard. The suggested plan is not Parisian, but Berlinian. An avenue of trees down the middle is what the Marylebone Vestry is thinking of. The City of Boulevards is not Paris, but Berlin. English people forget that, or are ignorant of the fact—because for one of them who visits Berlin, a hundred visit Paris. The typical Berlin boulevard means an avenue down the middle, and a row of trees at each side of a street. In Unter den Linden, for example, there are three avenues in the middle, a plan which is being followed in some of the fine new streets.

ANTIQUARIES are trying to save from destruction the Herber Tower, in the Town Wall, Newcastle. They are solicitous, as well, for the preservation of the ruin in Heaton Park, known as "King John's Palace." That same ruin has been the cause of a good deal of speculation with visitors to the park. It does not appear to have any direct history, but Mr. Cadwallader J. Bates, an eminent authority on local lore, discovered a clue which bears facial evidence of probability. In some ancient document he found that King Henry III. granted at Westminster, in 1267, a licence to John Comyn to enclose his principal seat in the manor of Tarsset, on the North Tyne, and to crenellate and fortify it, on the remarkable condition that it should be done after the same fashion as the seat of Adam de Gesemuth (Jesmond) at Heaton. This Adam was in that very year the High Sheriff of Northumberland, and had acquired an evil fame for robbery and extortion, and there can be little doubt, according to Mr. Bates, that the ruins in Heaton Park are those of the "camera" of Adam de Gesemuth. The sheriffs of the thirteenth century, being men of such ill-disposition, needed the protection of stout walls, and probably Adam received permission to fortify his home because he was a staunch adherent of the King. So, too, was the John Comyn, aforesaid. Not far from the ruin is a spring known as "King John's Well." When the Newcastle Corporation became possessed of the Heaton Park, excavations were made around the ruins of the palace, and amongst the relics which the workmen discovered was an

old stone trough. This was utilised in connection with a spring that flowed in another part of the grounds, and was christened after the palace, the surmounting stone having inscribed upon it the words, "Ye Well of King John." It is not known how the name of King John came to be connected with the place.

A DURER SOCIETY is in course of formation in order to supply artists with fac-similes of the etchings and engravings of that great master at a moderate price. An artist could hardly have been selected whose work has already been so admirably reproduced. The only *raison d'être* of the society is to obtain examples at a lower cost than heretofore, which, as Mr. Ruskin has urged, is not always advantageous to the cause of Art.

It is reported that a well-known Member of Parliament, representing a London constituency, is arranging to build and endow, at a cost of £120,000, a new wing to the University College Hospital, in commemoration of the Queen's long reign. Another munificent gift is promised by a resident of Hampstead, who proposes to build and endow a seaside convalescent home, at a total cost of £70,000, for the benefit of necessitous people in his parish.

THREE very ancient MSS. have recently been unearthed at Luton. They were found up the chimney by workmen employed on the demolition of an old house. One parchment is in book form, and the other two are scrolls. The volume is elegantly engrossed, and artistically illuminated in colours and gold. The engrossing on the scrolls is also an exhibition of fine penmanship. The documents have been cleaned by the officials at the MSS. Department of the British Museum, and Canon Pynchard, vicar of Christ Church, Luton, who has interested himself in the discovery, finds that one of the scrolls is a Bull of Pope Urban V. or VI., and issued to the vicar of Shefford—presumably the village in the north of Bedfordshire of that name—in the fourth year of his Holiness's Pontificate, commencing with the Papal greeting, and setting forth that certain persons shall be rebuked unless they discontinue certain behaviour. The date would seem to be the fourteenth century. The other scroll is a manor roll, and records the transference of land. The volume is incomplete. After translation the documents will be presented to the Corporation, to be held in trust for the town.

We are getting nearer and nearer to colour-photography, but the eager runners toward this fascinating goal are still baffled. The French process recently submitted to the Society of Arts by M. Villedieu Chassagne, on behalf of himself and Dr. Adrien Michel, and explained by Sir Henry Trueman Wood in the *Times* in rather more detail than in the Society of Arts Journal, is to some extent a secret. But enough is known to show that a photograph has not yet been actually taken in colours. A coloured print is not obtained. When the negative is developed and fixed in the ordinary way it looks like any other negative. A positive is printed from it, and that, too, looks exactly like an ordinary photographic print or transparency, and shows no trace of colour. But it is a specially-prepared positive, and when it is washed over with three coloured solutions—blue, green, and red—it takes up in succession the appropriate colour in the parts, the combinations of the colours giving all varieties of tints. This is wonderful enough to baffle the experts in knowledge of the ordinary photographic processes and of the action of light. The inventors, however, are not ready yet to disclose the secrets of their method, and the precise value of the discovery as an advance in colour photography cannot at present be determined.

THE formal opening of the smaller of the two new water reservoirs at Fowey took place a few days ago. The reservoir is 75ft. by 60ft. wide, 11ft. 6in. high, and is supported by strong and numerous pillars. The reservoir at Windmill Field will be completed by the end of April next.

### SUNDERLAND BUILDING BYE-LAWS.

THE proposed bye-laws as to new streets and buildings in Sunderland are likely to cause some lengthy committee meetings. It is pretty safe to say that the discussion will chiefly centre around the points raised by the memorial presented by the Architects and builders. Bye-law 3 orders that if any street is so situated that, in the opinion of the Corporation, it will or may become a main or leading thoroughfare, its width shall be 50ft. at the least, or if houses therein exceed 35ft. to eaves its width to be 60ft. The memorialists state that if this bye-law is passed the power thus given should be used with the utmost discretion, and they are strongly of opinion that if a road has to be made of a greater width on account of the probability of its becoming a main thoroughfare, the Corporation should pay for such increased width, as well as for the paving and flagging of such increased portion. Then the bye-law says that in all other instances the minimum width of new streets shall be as follows:—40ft. for front or cross streets, the houses not being more than 26ft. to eaves. This the memorialists contend is unnecessary, and would tend to prohibit the building of one-storey houses, and they add: (1st) Whatever restrictions are imposed, cottages will always be the popular class of house for working men. (2nd) By the increased width of streets the eventual cost of maintenance and cleansing will be greater to the town. (3rd) By the adoption of 40ft. streets the town and paved area of the town will increase in a greater ratio than at present. (4th) We consider 30ft. is sufficient width for cottage property. (5th) More latitude should be allowed in this bye-law, as houses are frequently built only one or two feet higher than 26ft. In the bye-laws with respect to the structure of walls, foundations, roofs, &c., exception is taken, especially to the following one:—"The whole ground surface or site of a new domestic building to be covered with a layer of Portland cement concrete six inches thick." The memorialists contend that that thickness is excessive, and they consider lime concrete is sufficient. Then, further, they do not think that it is necessary to enforce brick footings to the ordinary classes of property where concrete formations are put in. Further, it is unnecessary, they say, for the footings of every wall to be built in cement mortar to the level of the top side of the ground floor joists in cases where a damp-proof course is used. The committee consider that external walls of new buildings should be as follows:—Buildings 16ft. high, walls to be 14in. thick, and to have piers built every 3ft. apart of heading courses. These piers, the Architects and builders say, will induce dampness and destroy the advantages of hollow walls, and is the thickness not unnecessary?—12in. sufficient. Bye-law 25 states that the fall of all yards and gardens from the house to the back or front streets respectively to be one in thirty. This fall, it is pointed out, is very great, and dangerous in slippery weather, and the consequences would be serious where the yard was long and there was no or very little front garden. Builders should have the option of sloping their yards to any conveniently-placed gully where the back street is above the level of the front street.

THE opposition to the proposed demolition of Christ Church and other city churches in Birmingham is now organised into tangible form. A committee has been formed, and steps are being taken to call a public meeting of protest, and to raise a guarantee fund to oppose the Bill in Parliament.

It has been resolved to extend the Holt Schools of Science and Art, Birkenhead, by the erection of an electrical laboratory, at a cost of £931 13s.

The south wing of the new Medical School Buildings at Guy's Hospital will be formally opened in May. The sum required—about £13,000—has been entirely subscribed by the members of the staff and the teachers in the Medical School.

### THE TIMBER TRADES BENE- VOLENT SOCIETY.

A largely-attended meeting of merchants and others connected with the timber trade of the United Kingdom was recently held at Carpenters' Hall to form a benevolent society for the timber trade in celebration of the Queen's long reign. The chair was taken by Mr. E. J. Morgan, who was supported by Mr. C. Bird, Mr. C. J. Wade, Mr. W. L. Foy, the Hon. C. Lawrence, Mr. C. Churchill, Mr. H. H. Green, Mr. T. Stevenson, Mr. A. Raffety, Mr. G. L. Renton, Mr. W. H. Rider, Mr. B. G. Elliott, and Mr. L. Gabriel. The Chairman, in opening the proceedings, said that for many years the members of the trade had looked upon one another with feelings of mistrust and fear, but he hoped that they would now all work together as one body corporate.—Mr. C. Bird, who originated the scheme, then moved a resolution pledging the meeting to promote the speedy formation of the Timber Trades' Benevolent Society. He explained that the proposed Society was to provide annuities or temporary relief for necessitous and deserving members of the trade. At the present time the timber trade was one of the few trades that had no benevolent society. The object of the meeting was to remedy that state of affairs. The idea had excited an immense amount of interest in the trade, and £3000 had been already subscribed. The Society was to include the members of the trade throughout the United Kingdom, and they had received promises of support from many of the largest provincial firms.—The resolution was seconded by Mr. Wade, and adopted unanimously. The meeting then proceeded to elect officers. Mr. W. L. Foy was elected president, and Mr. E. J. Morgan the treasurer, while Messrs. Bird and Wade undertook the duties of hon. secretaries until such time as a paid secretary should be appointed. The following gentlemen were then elected as a committee, and the draft scheme for the formation of the Society was referred to them: Mr. C. Churchill, Mr. R. Brandt, Mr. J. E. Cobbett, Mr. B. G. Elliott, Mr. R. Foster, Mr. T. Gabriel, Mr. P. Hoar, Mr. L. Neame, Mr. F. Nicholson, Mr. G. L. Renton, Mr. A. Raffety, Mr. T. Stevenson, Mr. J. A. Wilson, Mr. T. Booth, Mr. W. H. Rider, Mr. C. Leary, Mr. Gellatly, Mr. Mulford, and Mr. R. J. Kidman.

### A YEAR'S BUILDING IN BIRMINGHAM.

THE following is the Surveyor's return of new buildings erected in Birmingham, for which plans were approved by the City Surveyor, during 1896, with a summary showing the corresponding figures for the three previous years:—

	1896.	1895.	1894.	1893.
Houses and shops .....	1,852	1,806	1,790	1,658
Business premises .....	35	13	30	26
Warehouses and shopping .....	247	197	117	149
Miscellaneous .....	314	313	353	291
Alterations and additions .....	324	246	242	163
Churches .....	2	2	1	1
Chapels .....	2	1	4	3
Schools .....	2	3	3	3
Totals .....	2,778	2,581	2,540	2,294

The plans submitted for approval numbered 1,017, as compared with 797 in 1895, an increase of 220. The churches are both temporary iron structures, one being situated in City Road, and the other in Cherrywood Road. The chapels, two in number, are a Baptist chapel, in Crabtree Road, and a temporary chapel, in Elkington Street. The schools are St. Martin's (Church of England), Dean Street, and Wesleyan Schools, in Benacre Street. The principal items among the miscellaneous are the rebuilding of the Gaiety Palace, Coleshill Street; a new police station, at Harborne; branch district post office, Five Ways; extension of Central Fire Station, Upper Priory; water-gas works, at Saltley and Windsor Street; extension of the Deaf and Dumb Institute, Edgbaston; reconstruction of the old Inland Revenue Offices, Waterloo Street; mission-room and institute, Freeth Street; mission-room, Garrison Lane; mis-

sion-room and Sunday school, Belmont Row. The alterations and additions include alteration and extension of Unitarian Chapel, Newhall Hill; extension of schools, All Saints' Church Hockley; enlargement of Free Library, Aston Road; additions to Board schools in Highfield Road, Saltley, Hutton Street, Goodrick Street, and Icknield Street; also to St. Matthias's Church School, Wheeler Street, and to schools in South Street, Harborne, and Tennant Street. Amongst the business premises are: New premises for the National Telephone Company, Newhall Street and Edmund Street; Messrs. Newberry's, Old Square; A. R. Dean, Corporation Street; rebuilding Hen and Chickens, New Street; residential premises, Cornwall Street and Newhall Street. During the year 773 notices have been served on property owners and others as to dangerous buildings and projecting signs. Six hundred and forty-nine square yards of land have been given up to the Corporation by owners of property setting back shop fronts, bay windows, and other projections. Under the Factory and Workshops Acts 142 factories have been inspected, 17 of which have been altered, and 23 others are now being altered in accordance with the requirements. The year generally has been a very busy one with the building and kindred trades in the city, and has been chiefly notable for the number of new warehouses and factories that have been erected, and for the many large alterations and extensions of existing factories that have been made.

### KEYSTONES.

ON the 4th February operations for the demolishing of the Leinster Hall, Dublin, were commenced for the purpose of transforming the building into the projected new Theatre Royal. It is shortly intended to advertise for tenders for the construction of the works. The tenders will, it is said, not be confined to Ireland, but, other circumstances being equal, Irish contractors will have the preference. The plans have been already passed by the Corporation, and the work will be proceeded with as quickly as possible.

THE EARL OF LEICESTER has given a donation of £2,000 towards the fund which is being raised to rebuild the Jenny Lind Infirmary at Norwich, in commemoration of the Queen's long reign.

It is intended to build a chancel, vestry, and organ chamber, and reseal Holmesfield Parish Church. The total cost will amount to from £350 to £400.

THE Primitive Methodists have obtained a site opposite the Manchester, Sheffield, and Lincolnshire new station, Wigan, for the erection of a hall and schools. The scheme will cost about £2400.

A MEMORIAL tablet to the late Mr. John Grindrod, formerly head master of the Central Schools, Ince, has been unveiled at the Ince Parish Church.

WESLEYAN Chapel extension in London proceeds apace. During the past year four large chapels have been opened, and a fifth chapel has been acquired by purchase. At Waltham Abbey, and also at Cheshunt, immediate steps are to be taken to build new chapels. A special committee is dealing with West Ham. In the Barking Circuit steps are being taken with a view to extension. Gospel Oak and certain parts of Stratford Circuit are to receive attention. At Walthamstow one new chapel is to be built immediately, the site for another has been secured, which is now occupied by a temporary iron structure.

THE old school connected with Christ Church, Southport, has been sold, and a new school is to be erected as a memorial of Archdeacon Clarke, who was so long vicar of the parish.

SIR ALFRED HASLAM has undertaken to defray the cost of erecting a new aisle to St. Paul's Church, Derby.

COLONEL C. H. LUARD, C.E., from the Local Government Board, has held an inquiry at Greetland into an application by the Council for sanction to borrow £4,200 for sewerage purposes.

## Professional Items.

**ARMLEY.**—A new chapel and schools are in course of erection at Armley. The site, which is 1,391 square yards in extent, cost £417 6s., and including that sum the total cost of the chapel and schools is estimated at £3,577. The plans were prepared by Mr. W. S. Braithwaite, Architect, South Parade. The buildings, which will have a very pleasing appearance, will be of brick, relieved with stone dressings. The style adopted is a plain treatment of Gothic, the main features being the tracery window in the front gable, the tower, which will be an octagonal wood and slate spire at the corner of the building, and the clerestory treatment of the nave. The chapel is divided into nave and two side aisles, and is 52 ft. long by 39 ft. wide, independent of the organ and choir chamber. On the ground floor there will be accommodation for 300 persons, the choir will be seated for twenty, and in an end gallery provision will be made for ninety—in all, 410. The entrances will be at the two corners of the chapel, facing Hall Lane, and they will be connected by a vestibule or corridor.

**BELFAST.**—After improvements, extensions, and renovation, Falls Road Methodist Church has been re-opened. The work has been undertaken and carried out in two sections; the first section comprised the addition of over seventeen feet to the length of the church, including the roof and galleries. A specially-arranged pulpit has been erected, with communion space and rail. Grouping therewith is the choir and organ gallery, all being carried out in polished pitch-pine, with mahogany dressings. The ground floor of the church has been re-pewed with open bench end seats. The entrance porches have been completely reconstructed; swing doors and glazed screens have taken the place of the pre-existing awkward doors; the floors of the porches have been tiled with encaustic tiles. The stairs to the galleries have been improved. The windows have been reglazed with cathedral leaded lights, of simple, quiet tints. Windows have been opened in the front facade, which not only light up the inner porches and stairs, but also throw light under the deep end gallery. The street entrance, gates, and railings are to be improved. The second section of the work comprises a suite of congregational rooms at the rear of the church, opening off the galleries, as well as from the ground floor of the church. The builders' work of No. 1 section has been carried out, and the second section of the work commenced, by Messrs. J. Lowry and Son, of Great George's Street, from the plans and under the superintendence of Messrs. J. J. Phillips and Son, Architects, Belfast.

**BEVINGTON HILL.**—The opening of new altars in St. Bridget's Church, Bevington Hill, took place last Sunday. The altars consist of a plain alabaster table raised on steps of St. Anne's marble. A massive tabernacle, surmounted by a lofty canopy of Caen stone, is placed in the centre. At the sides are niches destined for statues of S.S. Patrick and Columbkille, who, with St. Bridget are the chief patron saints of Ireland. In the reredos are inserted four panels illustrating the life of St. Bridget, the sculpture which is in high relief, having been executed by Messrs. Norbury and Paterson.

**BLAIRGOWRIE, N.B.**—Plans and specifications have been prepared for the Post Office building, Kirriemuir, by Messrs. L. and J. Falconer, Blairgowrie and Fort William. The whole contract has been undertaken by Messrs. Crabb and Ballantyne, masons, and Mr. Charles Ogilvy, joiner, Kirriemuir.

**BRIGHTON.**—The new out-patient department of the Sussex County Hospital—the foundation stone of which was laid on the 29th Feb. of last year—was opened by the Duchess of Fife, on the 29th Jan. The building, which stands on the opposite side of the

road, facing the hospital, is built of brick, with a covering of plaster-work. It is simply one story in height, but is of fine elevation. The main entrance leads by way of a short passage to the waiting-hall, a lofty room, 92ft. by 26ft. At the rear are a double set of examination rooms, one for the medical staff and the other for the surgical staff. Dressing and bath rooms are attached to each, and there is also a dark room for eye patients. Further back still is a dispensary with waiting lobby attached. The heating will be effected by means of hot-water pipes, and the building is to be lighted throughout with the electric light, which is already fitted. The work, which has occupied a little less than twelve months, has been carried out by Messrs. Saunders and Sons, of Brighton.

**BRISTOL.**—A new block of buildings is being erected on a prominent site in Baldwin Street, at the corner of Marsh Street. The style of the building is Renaissance, and it consists of four storeys and basement. Externally the ground floor is of blue pennant and Hamhill stone, the upper floors being executed in Bath stone and bright red Cattybrook bricks. Internally the ground floor is being designed to accommodate two insurance companies, with separate entrances, while the remaining floors are devoted to suites of offices. There are strong rooms and lavatories on each floor, and other conveniences. It is expected the building will be ready for occupation by September 29th next. The estimated cost of the work, including cost of site, is £13,000. Mr. Edward Gabriel is the Architect, and Mr. A. J. Beavan the builder.

**BRISTOL.**—The Almondsbury Cottage Hospital, which has been offered to Bristol by Mr. Sholto V. Hare, in connection with the proposal to found a convalescent home for the medical institutions, is of an ornamental character. It is of the modernised Queen Anne style, built of Cattybrook brick, with rich freestone facings. The main entrance is under the clock tower, and leads into a commodious vestibule from which access is gained to the parish or clubroom. The staircase is elaborately carved. At right angles to this part of the building is the hospital, which consists of three sick wards for the accommodation of five patients, and the convalescent ward. All the rooms are fitted with the most modern appliances and teak seats. The rooms are lofty and well ventilated. The tower contains a double-faced clock, which chimes the hours and half-hours on fine bells. The building was erected according to the plans of Mr. C. E. Ponting, Diocesan Surveyor, of Marlborough.

**BROADCLYST.**—Attention has been called to the serious condition of the pinnacles of the tower of the parish church. In September last, during a gale, one was blown off, carrying away one of the grotesque gargoyles. The pinnacles have been examined by Mr. Harbottle, F.R.I.B.A., and he reports that all the eight need attention, and that one in particular is really dangerous, inasmuch as, if it fell, it would certainly pierce the roof of the church. The Church and a portion of the tower were erected about 1400, the tower being at a subsequent date completed to a height of 100ft. exclusive of the pinnacle.

**CARDIFF.**—A new school at Howard-gardens, Cardiff, was opened on the 3rd inst. The building is erected at the rear of the Cardiff School Board Offices, Howard-gardens, contiguous to the lecture theatre of the higher grade school, and is a block of buildings 117ft. long by 42ft. in width, and two storeys in height. The ground floor comprises two class-rooms, each accommodating fifty scholars, with cloak-room and lavatory accommodation conveniently situated. Upon the same floor is situated the gymnasium, and also a students' workshop. The first floor affords accommodation for two class-rooms, each accommodating fifty scholars, the rooms being divided by revolving wood shutters. The art class room is also situated upon this floor, and is well lighted, and there are also teachers' private rooms, store-rooms, cloak-

rooms, and lavatories. The buildings are constructed wholly of white pressed brick, relieved with red brick bands and arches, which harmonise with the adjacent buildings, and at the same time have a peculiarity of their own. The roofs are covered with green slates and red terra-cotta cresting. The floors throughout are constructed of concrete, with iron joists, covered with wood blocks. The buildings have been erected by Messrs William Thomas and Co., Cardiff, under the superintendence of the Architects, Messrs J. P. Jones, Richards, and Budgen, Cardiff.

**DONCASTER.**—The Doncaster District Council has decided to request the surveyor, Mr. Wood, to tender his resignation, owing to his failure to satisfactorily maintain the roads under his charge. At the meeting it was stated that the County Council had threatened to stop payments until the roads were put in repair, and that there were complaints from all parts of the district. The surveyor said he would not tender his resignation; he would take his discharge. Mr. Harrison gave notice that at the next meeting he will move that the surveyor receive three months' notice.

**DUNDEE.**—At a meeting of the Works Committee of Dundee Town Council on the 2nd inst., the plans, sections, and elevations of offices and warehouses for John Robertson and Son, Limited, on the lot of ground in Seagate recently feued from the Town Council, were submitted for approval. The matter was, however, deferred.

**GARSDALE.**—The Church in the parish of Garsdale is in such a sad state of repair that it is impossible to use it with comfort. Mr. J. F. Curwen, Architect, of Kendal, has examined the fabric, and reports that it is necessary to take down and rebuild the west end and belfry, re-slate the roof, rebuild the buttresses, reseat the church, and replace the plaster destroyed by the wet getting through the walls. The cost is estimated at about £500.

**HARROGATE.**—The new school erected at New Park, Harrogate, by the Harrogate School Board, has been formally opened by the Chairman of the Board. The building, which occupies a position on the south side of Skipton-road, has been erected at a cost of something like £6,000, from the designs of Mr. George Bland, Architect, of Harrogate. It includes five class-rooms, infants' room, and cookery-room; the whole being grouped round a central hall. Accommodation is provided for some 500 scholars, while the central hall will accommodate 300 adults for concerts and public meetings. The contractors are:—Henry Abbott, Harrogate, mason; George H. Carrick, Harrogate, joiner; Laycock Brothers, Harrogate, plasterers; J. Shepherd, Harrogate, slater; F. Barrand, Leeds, plumber; D. E. Hutton, Shipley, painter; J. Child, Harrogate, concreter; and Auty and Son, Leeds, iron-founders. The clerk of works has been Mr. G. Fletcher, of Harrogate.

**KEIGHLEY.**—The infectious diseases hospital at Morton Banks, built by the Keighley and Bingley Joint Hospital Board, was formally declared open on the 2nd inst. by the Chairman of the Board. The hospital is built on rising ground above the main road running between Keighley and Bingley, and is fitted up on the latest and most improved principles. The erections comprise an administrative block, an isolation block, with accommodation for six adult and two child patients; the scarlet fever block, large enough for twelve adults and twelve children; a block containing the laundry machinery and disinfecting apparatus, a mortuary, and a porter's lodge. Although internally, as everything is ready for use, the scheme is not yet by any means completed. The ultimate cost cannot be less than £21,000. The buildings have been erected from the plans of Messrs. J. Judson and Moore, Architects, of Keighley, and Mr. R. Armistead, of Bingley, has acted as the Surveyor to the Hospital Board.

**LANGLEY MILL.**—Mr. E. T. Hooley, of Risley Hall, opened a new Church school at Langley Mill a few days ago. The buildings, which are of a very substantial character, were erected by Mr. George Oldershaw, of Marpool, from the plans of Mr. John Holbrook. Accommodation has been provided for 200 infants, and the scheme has cost about £900 in carrying out. The buildings will be used both as day and Sunday schools. There are now no less than ten schools in the parish, and in enlargements and new buildings considerably over £6,000 has been expended during the past eleven years.

**LEWES.**—The new schools at Lewes constitute a solid and convenient block of buildings situate at the back of St. John's Terrace. There are two separate blocks, the largest being the boys and girls' school, which are under one roof, while the other is for the infants. Externally the new schools harmonise with the ancient character of the town, the style being early English, with red tiled roofs and a bell tower on the roof of the boys' school. The entrance to both schools is by stone porches, and immediately inside of the porches are provided cloak-rooms with every convenience. The accommodation for the girls comprises a room about fifty feet long by twenty wide, and also a class room. Both rooms are match-boarded all round to the height of about five feet, and the school furniture is of pitch pine. The most complete system of ventilation has been provided, and in such a way as to render draughts impossible. The class-room is heated by a large register grate, while the schoolroom is well heated by a large stove. The boys' school is divided from the girls' school by a glass door, and is of the same dimensions as the girls' school. It has also a class-room, and both are fitted with everything up-to-date in the way of school appliances. There is accommodation for about 200 boys and 200 girls. The infants' school is on the south-west side of the main entrance. The cost is estimated at £4,000.

**MATLOCK.**—Mr. Walter Holmes, a Matlock contractor, has commenced building a Church Institute and parish hall on a central site in Matlock Green, right in the middle of the populous district of Matlock, and the cost will not be far short of £2,000. The building will be of substantial local stone, with two storeys, and will contain a large hall on the first floor capable of seating 250 persons, a caretaker's house, billiard and other rooms, and lavatories. The building will measure 80ft. by 26ft., and the assembly room will be 62ft. long.

**MONMOUTH.**—The Monmouth Town Council has accepted the sureties of Messrs. Johnson Bros., Hereford, for £2500 for carrying out their portion of the drainage and electric lighting scheme, and the seal of the Council has been affixed to the contract. It has been decided to postpone the contract for constructing a delivery main between the pumping and purifying stations pending further information as to the septic process of purification.

**NEWPORT.**—Messrs. A. S. Morgan and Co.'s tender for the new Victoria Theatre is the lowest. It amounts to £8,500, but does not include the decorations or furnishing. The total cost is estimated to be £12,000. When completed, the new structure will be practically fire-proof in every way, and the work, when the contract is signed, will be commenced forthwith. Mr. Sprague, Arundel Street, Strand, is the Architect. The syndicate appears anxious to get the whole work completed for £9,000. Tenders for the work were privately sought for, but there were not many sent in.

**RAVENFIELD.**—The new pulpit and font of St. James's Church, Ravenfield, near Rotherham, were dedicated a few days ago. The restoration of this picturesquely situated building is now completed, the whole cost having been over £300. In addition to necessary repairs, etc., the church has been re-seated with pitch pine benches, a carved oak reredos erected, the

centre being filled with a valuable oil painting of the Spanish School, and the walls of the sacrum hung with curtains, the semi-dome above having a colouring of blue, studded with gold stars. In regard to the pulpit, it is of oak, with open panels of tracery, in keeping with the design of the choir stalls, and presents an exceedingly attractive appearance. The font is also of oak. It is octagonal in shape, and has carved panels. The restoration has been carried out from the designs and under the superintendence of Mr. E. Isle Hubbard, M.S.A., of Rotherham, by Mr. J. Wortley, of Rotherham.

**ST. HELENS.**—The proposed extensive alterations to the Central Post Office in Church-street, St. Helens, have just been commenced. The present premises have long been inadequate for the rapidly-increasing business, and the authorities some time ago acquired the adjoining site occupied by the wooden premises of the late Mr. Gee, confectioner. The site has been cleared, and the work of extending the Post Office will now be pushed rapidly forward. The principal alterations to be effected include a considerable extension of the general office for public business, and more satisfactory provision for the transaction of telegraph, postal and money order, and telephone business. A new office will be provided for the postmaster, and improved accommodation will be found for the letter-sorting branch of the office work. The alterations are being carried out by Messrs. Rothwell and Sons, builders and contractors, St. Helens, and will be completed in the course of the present year.

**ST. NICHOLAS.**—A rather elaborate village hall has been erected by Mr. John Cory, J.P., D.L., at a cost of £1,200, at St. Nicholas, on the main road to Cowbridge. Built of Duffryn stone, and covered with red Broseley tiles, the building consists of a hall capable of accommodating 250 persons. A retiring room is provided at the platform end, also a general coffee and reading room, with a private tea room, and a house for resident caretaker. The Architects are Messrs. Lansdowne and Griggs, Newport, and the builders, Messrs. Horton and Co., Chepstow.

**SHAP.**—At a meeting, held in the Board School, the committee appointed at a previous meeting submitted revised plans by Mr. Oliver, Carlisle, for the proposed alterations in the Church as follows: That an extension be made on the south side of the chancel, behind the vicarage pew, so as to take in the path to the south door, the addition being divided by arches from the chancel; and that the organ-chamber be built on the north side of the chancel. The enlargement on the south side will, it is expected, accommodate about seventy persons, chairs being recommended here. Re-flooring, re-roofing, new seats, new windows, heating apparatus, &c., will all be required; and the estimated cost of the whole is about £2000. The plans were adopted.

**SHEFFIELD.**—Under the auspices of the Sheffield Technical School, Mr. F. Boulden is to deliver a course of free lectures on Tuesday evenings in the Attercliffe Vestry Hall, on "The Mechanics of Engineering." The subject is divided under the following heads, each of which will form the basis of a lecture: Force—Effect of Combined Forces; the Mechanics of Pulleys—the Pulley-block and Lever; Transmission of Power; the Arithmetic of Wheel-gearing, Lifting Gear, &c.; Strength of Materials—Method of Testing; Strength of Boilers, Pipes, Riveted Joints, Fly-wheels; and Strength of Beams and Framed Structures.

**SWINDON.**—The new technical schools which have been erected in Victoria Road, Swindon, by the local Technical Committee, were recently opened by the Right Hon. Lord Herschell. The total cost of the school has been £12,000. The style adopted for the building—a phase of English Renaissance—was determined by the requirements of the lighting of the various

departments, and the necessity for strict economy being exercised, to enable a building affording such extensive accommodation to be erected within the limit of cost available. To secure this, the building has been kept free from ornament, with the exception of the enriched dressed stonework emphasizing the principal entrance and the centre gable, and a dignified effect has been obtained by depending entirely upon the proportion and grouping of the various parts. The building is constructed of local bricks with moulded brick cornices and string courses covered with Sedan small grey slates. The centre block is one room deep, with a wide corridor along the back leading to the projecting wing at each end. The building consists of three floors, all of which are lofty and well-lighted. The principal entrance is to the middle floor, and is approached by an embanked roadway and a broad flight of steps with wing walls. The building is designed in such a way as to admit of enlargement, by the extension of the two end wings. The accommodation provided is as follows: on the ground floor, class room for chemistry and physics, chemical and physical laboratory, store room, preparation room, and caretaker's apartments; middle floor, lecture room, class rooms, cookery rooms, master's room, and secretary's and porter's offices; upper floor (Art), life room, model and painting, drawing, machine drawing, geometrical drawing, &c., and master's room. The building is heated throughout by hot-water pipes from a boiler in the sub-basement, and special attention has been given to the ventilation. There was a very large attendance at the opening ceremony, over which Lord Edmond Fitzmaurice presided. Among those present were Lord Herschell, Lord Cork, Viscount Emlyn, Sir Nigel Kingscote, Mr. N. Story Maskelyne, Mr. A. Hopkinson, M.P., Mr. A. Hubbard and Major Dean.

**TEIGNMOUTH.**—A large and convenient hall at Teignmouth is regarded as absolutely necessary. A site has been secured in Station-road running back to Lower Brook-street, and the building is to be so constructed as to be capable of use for theatricals, bazaars, concerts, &c., with lobbies and cloak rooms and separate exits into each street. The length of the hall will be 92ft., and the width 43ft., with height to the roof of 36ft., and seating accommodation for 500 to 600 persons, so arranged that every person will command a view of the stage. Heating and ventilation will be well treated, and the lighting thoroughly gone into by the Architects, Messrs. Watson and Watson, of Torquay. The estimated cost for a substantial, though plain structure, with ornamental frontage, is £3000.

**WOLVERHAMPTON.**—The new Post Office which has been erected in Lichfield Street, Wolverhampton, at a cost of £17,000, is nearing completion, and will be opened by the Mayor about the beginning of March. The structure is a handsome one in the French Renaissance style, and the buildings cover about 1,704 square yards. Externally it is of red brick, with buff terra-cotta dressings. The principal frontage of the building is to Lichfield Street, and extends about 128ft. There is also a frontage to Princess Street, and the rear of the premises are in Berry Street. The offices are spacious, convenient, and comfortable, and, arranged on the best practical lines. Each section of the staff will have their kitchen, retiring rooms, and lavatories. The building will be lighted by electricity, and heated by the low-pressure hot water system. Mr. Henry Tanner, of the Board of Works, was the Architect, and Mr. Henry Crovalt, Wolverhampton, the builder.

Mr. J. GALLOWAY WEIR, M.P., has received an intimation from the First Commissioner of Works that arrangements have been made for the immediate repair of the ancient tapestries at Holyrood Palace.

SIR JOHN PULESTON, Constable of Carnarvon Castle, has offered to give a site, within the walls of Carnarvon Castle, for the offices of the University of Wales.

## SOCIETY MEETINGS.

**Leeds and Yorkshire Architectural Society.**—Under the title of "Two Methods of Architectural Practice and Design," Mr. W. H. Bidlake, M.A., of Birmingham, read a paper before the members of the Leeds and Yorkshire Architectural Society at the Leeds Mechanics' Institute on Tuesday, the 2nd inst. In the course of his paper he remarked that a variety of new forces, such as the introduction of machinery and the spread of the commercial spirit, had destroyed the old traditional method of building, and now we were in a state of flux. It would take some considerable time before anything like a single or definite aim once again actuated architects as a body, and it behoved them to consider how they could best bring about a more satisfactory state of things by eliminating thoughtless architecture, which was simply swayed by passing fashion, and, by being true to first principles, assisting the development of some general evolution towards a new style. In illustration of this point, Mr. Bidlake took two typical instances. On the one hand, the architect who merely satisfied the present thoughtless demand, although he might be perfectly conscious that the popular demand was not the right or the refined one; and on the other hand, the man who had convictions and principles, and who, instead of being willing to sacrifice these for his commission, endeavoured to modify public opinion, and so bring about a period of better taste. Mr. W. Watson, of Wakefield (president of the society), occupied the chair.

**Glasgow Institute of Architects.**—The usual quarterly general meeting of this institute was held in the rooms, 187, Pitt-street, on Thursday, the 28th ult., Mr John James Burnet, A.R.S.A., president, in the chair. It was reported that among other recent additions to the institute's library was the work by Taylor and Cresy on the "Antiquities of Ancient Rome," presented by Mr. David Thomson. The president referred to the fact that two of the members, Messrs. Honeyman and Leiper, formerly associates of the Royal Scottish Academy, had now been elevated to full membership. The secretary reported that the prize-drawings of the Royal Institute of British Architects would be on exhibition in the rooms of this institute during the two weeks commencing 12th April next. It was agreed to hold an informal dinner in the rooms on the 3rd March.

**Glasgow Architectural Association.**—On Tuesday the 2nd February the president, Mr Wm. Tait Conner, A.R.I.B.A., in the chair, Mr Wm. U. Muir read a paper on "Foundation." No part of a building, he said, was beneath the careful consideration of an architect. It was quite possible for an architect to be more interested in the decoration and beautifying of his building than in the study of the best means to secure its durability. The essayist described the best methods of securing foundations suited for different kinds of soil, which latter he divided into two classes, natural and artificial; or made-up. He stated that though concrete was undoubtedly the best material for foundations, good hard, well-burned brick was better than stone. Mr Muir described the different methods of piling. The paper was well illustrated with a number of diagrams.

On Jan. 26th, Professor E. J. Mills, of the Glasgow and West of Scotland Technical College, delivered an address, "On the Application of Photography to Architectural Measurement." He stated at the outset that the architectural capabilities of an ordinary camera, and consequently of an ordinary photographic print, were much greater than usually supposed. It was, however, necessary that the camera should be used with reasonable care, and especially that it should be (1) rigorously upright, and (2) parallel to the plane of a building whose reproduction was desired. A single measurement in the plane itself would then give a scale for any part of the resulting negative or print. But operations were greatly facilitated by the simple graduation of the ground glass into squares and their sub-divisions; thus enabling the observer to obtain the parallelism at once, as well as verticality, and to measure

also the height of an object's image. Professor Mills went on to explain how, by the aid of very simple mathematical formula, the height of a distant object, accessible or not, could be easily ascertained with a camera so provided. Among adjuncts to a measuring camera, a Groulier ball-and-socket support was shown for a half-plate camera, and a three-point screw support for a whole-plate camera. Professor Mills supports his lenses in rising and cross fronts, each provided with scales and venicles and screw motion, which he uses for obtaining very delicate measurements of the dimensions of images on the ground glass. The lenses he prefers are ordinary Goetz and wide-angle Zeiss rectilinears. It was shown that by following very easy rules, the plan of a photograph could be readily drawn; an illustration of this was exhibited. The lecture concluded with the exhibition of a number of architectural lantern slides, illustrating a variety of points referred to in the lecture.

**The Architectural Association of Ireland.**—The ordinary fortnightly meeting of this Association was held on the 2nd inst., at the Grosvenor Hotel, Dublin, Mr. R. Canefield Orpen in the chair. Mr. W. J. Fennell, M.R.I.A.I., Belfast, delivered an interesting lecture on the "Characteristics of Centaur Architecture Remains in the Counties of Down and Antrim." The lecture was illustrated by a large number of lantern slides. Mr. Thos. Drew, R.H.A., President R.I.A.I., moved a vote of thanks, which was seconded by Mr. A. I. McGloughton, and Mr. Walter Doohir. The president and others having spoken in appreciative terms of the value of Mr. Fennell's lecture, the proceedings terminated.

**Bradford Society of Architects and Surveyors.**—The annual meeting of this society was held on Friday, the 29th ult., at the Great Northern Victoria Hotel, the members present being Mr. James Ledingham, president; Mr. B. D. Fairbank, secretary and treasurer; and Messrs. Charles Gott, John Hindle, T. H. Healey, Charles France, Samuel Jackson, W. B. Woodhead, Wheeler Smith, C. H. Hargreaves, T. C. Hope, Richard Horsfall, R. Armistead, Rhodes Calvert, Brian Cowgill, James Young, W. H. H. Marten, Samuel Robinson, John Flew, Thomas Barker, C. E. Milnes, C. H. Gott, A. G. Adkin, John Drake, T. T. Empsall, J. H. Woodhead, Walter Jackson, Alfred Walker, Charles D. Collinson, and H. A. Johnson. Mr. W. B. Woodhead was elected president for the year, and Mr. Fairbank was re-elected secretary and treasurer. After the election of the Council the annual dinner was held. Mr. Gordon ably proposed "Prosperity to the Bradford Society of Architects and Surveyors," and Mr. Charles Gott responded. Six new members have been elected this year, and the health of these was proposed in a characteristic speech by Mr. France. "The Town and Trade of Bradford" was given by Mr. Hope, and Mr. John Maddocks, who responded, dwelt on the state of trade and the outlook for the future. "Our Visitors" was proposed by the president, and "Our Municipal Authorities" by Mr. Hargreaves. Both these toasts were acknowledged by the Town Clerk in interesting speeches. The other toasts were "The President Elect," submitted by Mr. Jackson; "The Retiring President," by Mr. Healey; and "The Secretary," by Mr. Wheeler Smith.

**Society of Engineers.**—The first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, the 1st February, at the Royal United Service Institution, Whitehall. Mr. Samuel Herbert Cox, the President for 1896, occupied the chair, and presented the premiums awarded for papers read during that year, viz.:—The President's Gold Medal to Mr. George Thudichum for his paper on "The Ultimate Purification of Sewage;" the "Bessemer Premium" to Mr. H. B. Butler for his paper on "The Effect of Admixtures of Kentish Ragstone, &c., upon Portland Cement;" the "Rawlinson Premium" to Mr. W. G. Wales for his paper on "Discharging and Storing Grain;" and a "Society Premium" to Mr. M. A. Pollard-Urquhart for his paper on "Examples of Railway Bridges for Branch Lines." Mr. George Maxwell Lawford, the new president, after

briefly reviewing the work of the Society during the past year, drew attention to the steady reduction in the general death-rate of this country during the last fifty years and the comparative freedom from zymotic diseases, both of which were attributed to the progress of sanitary science and the impetus given to the practice and study of hygiene by the Public Health and River Pollution Prevention Acts. The provision of pure water and efficient drainage was the duty of the engineer, and on these two subjects, which are of such vital importance to all communities, the president based his address.

**Auctioneers' Institute.**—The third meeting of the session of the Auctioneers' Institute of the United Kingdom was held in the lecture hall, Chancery Lane, when a paper was read by Professor Bannister Fletcher upon "The Practice of Compensations." Professor Fletcher dealt with the mistakes which he ventured to think were sometimes made in the matter of compensation. Dealing with the deduction of ground-rent, he said that some surveyors seemed to think that ground-rent should be capitalised in making valuation. He showed the fallacy of this by an example:—If the ground rent was to be capitalised, why should not rates, taxes, and other out-goings? The common-sense view was that the income derived after all deductions was the income to be capitalised. In the matter of valuation of property to be surrendered, he argued that if a man's income was to be taken from him, he should not be compensated on some fanciful basis, but given such a sum of money which, re-invested in the same class of security, would yield him the same income. This surely was the basis of valuations and compensations. The lecturer illustrated his point by several examples of properties held at different ground-rents—one at £100, the other at £50. Capitalised on the principle he advocated, each property, he said, would give the same capital value. The greatest difficulty in compensation was when only a part of an estate or property was taken. A case in point was the widening the road at Streatham. Courtesy should be well recognised, and gentlemanly rules of conduct should guide all in a public position. He was told that one of the leading boards in London required its surveyor to interview tenants and lessees who had made claims against the board, and after they had placed the claim in the hands of their surveyor, had by threats of the costs of an action, and that the board would not pay any surveyors, induced them to settle. This he was told by one of their leading members. Again, the board's surveyor would not serve notice to treat, but endeavoured to force the freeholder, lessee, tenant, or their surveyors to come to terms without; and if at last he could not arrive at a price he wanted to purchase at, he would try and buy some other property, thus putting people to much unnecessary trouble and expense. The question might fairly be asked: Was this the proper course to pursue? Of course the surveyor might urge that he was compelled to carry out the instructions of his board, but should the board impose such unprofessional work on its paid officer?

**The Institution of Civil Engineers.**—At the ordinary meeting on Tuesday, the 2nd inst., Mr. J. Wolfe Barry in the chair, it was announced that seven associate members had been transferred to the class of members, viz.:—Messrs. Robert West Holmes, Albert James Humby, Robert Bridges Molesworth, M.A. (Cantab.), John Mitchell Moncrieff, Howard Devenish Pearsall, Percy Crosland Tempest, and Beresford Graham Wallis; and that 17 candidates had been admitted as students. The monthly ballot resulted in the election of five members and 36 associate members. It was announced that on Tuesday, February 9th, at 8 p.m., a paper would be read with a view to discussion on "Cold Storage at the London and India Docks," by Mr. H. F. Donaldson, and on Friday, February 12th, at 8 p.m., a paper on "Cooling Reservoirs for Condensing Engines," by Mr. Harold W. Barker, Stud. Inst. C.E.

A NEW pavilion is to be erected on Eastbourne Pier, at an estimated cost of £4,000.

the Stratford firm. The secret lies in the men. Mr. Marten looks what he is—a success. Always cool and clear-headed, courteous, concise in opinion, prompt in decision, Mr. Marten may serve for a typical man of affairs. The business is complex enough in all conscience, but that fact does not appear to trouble its proprietor. He knows all about it, as you may quickly discover by conversing with him. In nothing has Mr. Marten exhibited his capacity, as head of a great business, more notably than in his choice of a right-hand man. We maintain that no man can be a distinctly successful controller of vast interests unless there is given to him the faculty of insight and the intuitive judgment which enables him to select fitting collaborateurs. In Mr. E. M. Edwards, the general manager to the firm, Mr. Marten has a fellow-worker worthy of himself. Mr. Edwards has practically spent his business life with the same firm. He has watched its early growth, and aided in fostering its youthful energies, until he has to-day the satisfaction of seeing it in full vigour of life and prosperity. The manager is, in many ways, not unlike the master, equally prompt and business-like, equally courteous and kindly. Like all very busy men of our acquaintance, he seems to have time for a pleasant word amid however great distractions. We do not need to seek further in our neighbourly curiosity as to the secret which underlies the manifest good fortune of this firm. Principal and manager convey the same elucidation. They are men with clear heads and sound hearts, and well-served because they treat their fellow-workers with equal justice and courtesy, well trusted because they have made wide friendships, both personal and business, through years of untiring energy and unflinching rectitude.

THE Government Laboratory now in course of construction at Clement's Inn, Strand, will be ready for occupation in July. The new building is to cost £23,900.

#### FAMOUS FIRMS.

MESSRS. YOUNG AND MARTEN, OF STRATFORD-LE-BOW.

AMONG the many builders' merchants of the day, few are more widely known than the firm of Young and Marten, of Stratford-le-Bow. They are a characteristic product of the time—visible reamplifications of that industrial energy and commercial capacity which we have claimed as among the many qualities of our countrymen. From a quite ordinary little suburban business there has grown into vigorous vitality a vast and complete commercial organism. Beginning with a single shop, whose area was calculable in feet, Young and Marten have extended their business until the dimensions of their various premises are denoted no longer in feet, but in acres. We do not propose to drag our readers over these acres, for they would be wearied before we had told a tithe of the contents, and so should we. It is, we repeat, the personal equation that appeals to us. What manner of men are these who have gained such sure success, and how has it been done. Young and Marten's catalogue can tell us all about the multifarious contents of their warehouses—but we prefer the men to the merchandise at present. Mr. William Young appears to have founded the business some four-and-twenty years ago, in a quiet and modest way. For eight years things developed gradually, the connection steadily growing, and premises being added to now and again. Then came the year 1880 and with it Mr. H. H. Marten. Mr. Young knew his partner's energy, but little thought how far that energy would carry the then unassuming business in Broadway. For two years the partnership continued, when death dissolved it, and Mr. Marten took up the reins as sole proprietor of the concern. We have wandered in and out of the Stratford offices not a few times; have had more than one pleasantly inquisitorial chat with the guiding spirits of the place, and have long ceased to wonder at the success of

## SOCIETY MEETINGS.

**The Edinburgh Architectural Society.**

—At a meeting of this Society held in Dowell's Hall on Wednesday, the 3rd inst., Mr. W. H. Cumming, A.R.I.B.A., vice president in the chair, a lecture was delivered by Mr. Vallance, Curator of the Edinburgh Museum of Science and Art, on "Preconquest Stone Carving in Northumbria," illustrated by limelight views. On the motion of Mr. John Murray the lecturer was accorded a vote of thanks.

**The Dublin Master Builders' Association.**—The annual meeting of the Master Builders' Association was held at the Grosvenor Hotel, Westland-row, when there was a large attendance of members. The chair was occupied by the president, Alderman the Right Hon. Joseph M. Meade, re-elected; hon. secretary, John Good, re-elected; hon. treasurer, James Kiernan, re-elected; committee, James Beckett, Samuel H. Bolton, J.P., James Conolly, James Martin, Thomas Mackey, John Pemberton, Henry Sharpe, J.P., Alderman R. Toole.

**Middlesbrough and District Association of Foremen Engineers and Draughtsmen.**—The members of the Middlesbrough and District Association of Foremen Engineers and Draughtsmen recently held their twenty-seventh annual dinner at the Corporation Hotel. The secretary made a statement as to the position of the association during the past year. He said their total income for the past year was £165, and the total expenditure £127. The expenditure seemed rather heavy, but owing to several of the engineering industries being idle for repairs and alterations, several of their members were placed in the position of having to apply to the association for its benefits, and the sum of £37 had been expended in the out-of-work fund. Leaving out the out-of-work fund, their ordinary fund had increased £54 14s. 11d., while the out-of-work fund had decreased £16 4s. 5d. Their membership during the year had increased, but not so largely as in 1895. In 1895 they elected thirty-two members, while last year they elected fifteen, and he regretted to say that against that fifteen there were for various reasons eleven resignations. During the year there had been a total increase in the funds of the association of £38 10s., as against an increase in the previous year of £42 17s. In conclusion he urged them all to do their best for the association, as its success and usefulness did not depend upon the work of the active officials.

**Plymouth Master Builders' Association.**—The President (Mr. R. G. Jenkin) presided at the annual banquet of the Plymouth, Stonehouse, Devonport, and neighbourhood Master Builders' Association, held at the Royal Hotel, Devonport, on the 3rd inst. Mr. Sowerby gave the toast of "Success to the Master Builders' Association and the Building Trade." Mr. E. Pile replied on behalf of Devonport. Mr. H. Kerswill and Mr. Turpin also acknowledged the toast, and pointed out that it was only by combination and standing shoulder to shoulder, as the men did—(hear, hear)—that they would secure success. He hoped the master builders would come out victorious.

The detailed plans for the construction of a new dock by the Llanelly Harbour Commissioners are now completed, and have been submitted to the consulting engineer, Sir Alexander Rendel. In a short time everything will be ready for giving out the contract, and the commissioners are discussing the best means for raising the necessary money. The boring operations, which have been made on the site of the dock, have been most successful, and results more favourable than had been anticipated.

## Correspondence.

## DECORATIVE PLASTER WORK.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I notice on p. 371 of your issue of January 20th an illustration of a plaster ceiling for a house at Bournemouth, "designed by E. P. Warren." Let anyone compare this with the ceiling in house at Cullompton (1605), illustrated on p. 14 of "Gothic Architecture of the Renaissance in England," and they will at once see that Mr. Warren's design is an exact copy of that ceiling. The modelled foliage is also almost exactly like that illustrated on plate 73 of the same work. This is either a remarkable coincidence or I fail to see how Mr. Warren can claim to have designed the ceiling.

Yours truly,

H. GARNHAM WATKINS.

February 2nd, 1897.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—I don't know the ceiling Mr. Watkins refers to, but the ceiling you illustrated was not a copy of anything I have seen. Its lines may be nearly upon the same plan—a semi-geometrical type, not uncommon in 16th and early 17th century work. It was, with all its ornaments, freely modelled for me by Mr. Turner from a small scale sketch and details, very roughly scribbled full size during a hurried visit to the workshop. The ceiling forms part of the decoration of a room not of my design, and a somewhat archaic type, more so than I like myself, was suggested by surroundings. There was, however, no conscious copying of any old example.

Yours faithfully,

E. P. WARREN.

February 4th, 1897.

A NEW wing to the Mayplace Reformatory School, Old Swan, has just been opened.

The fund for the new Queen Victoria Jubilee Hospital in Belfast now exceeds £60,000.

It is reported that the re-building of Winchester Barracks is likely to be commenced in March.

The Local Government Board has sanctioned the borrowing of an additional £9,900 for electric lighting purposes at Croydon.

Strong opposition will be made to the Bill seeking powers to construct an overhead electric railway from Paddington to Willesden.

The shareholders of the Howe Bridge Cotton Spinning Company, Atherton, have decided to erect a fourth mill, with 60,000 spindles. The mill is expected to cost about £80,000.

MISS ELIZABETH HOLROYD has presented a drinking fountain to Starbeck, and has endowed it with £100, the trusteeship of the charity to be vested in the Starbeck Parish Council.

A TRAMWAY to the Pyramids is the latest anachronism. The Cairo Tramways Company is to make it, and the last home of the Pharaohs will soon be accessible from its own metropolitan base.

The opening of the Rustington Convalescent Home at Littlehampton has been fixed for Saturday, March 20th. The total cost of the building will be £50,000, in addition to £20,000 for its endowment.

PETERHEAD harbour is to cost much more than was estimated. The original estimate was £737,520. This has now been increased by the substantial sum of £160,000, making a revised estimate of £897,520.

The Manchester, Sheffield, and Lincolnshire Railway Company's canal has burst its banks between Bollington and Macclesfield. A large gap about a dozen yards square was made in its banks near to Clough Farm, through which the water made its way with terrific force.

ONE of the sections of the forthcoming Victorian Exhibition at Earl's Court is to be devoted to an exposition of women's work, and in this section is to be an Art gallery some 1300ft. long, which will be filled with the productions of women artists of the Victorian Era. This department of feminine Fine Arts is to be under the control of Miss Henrietta Rae.

## Trade and Craft.

MESSES. JOHN KING, LIMITED.

Considerable improvements have of late years been made in the methods of warming and ventilation of buildings, but hitherto it has not occurred to anyone to set forth a dual system. A new system of combined warming and ventilation has now been introduced, however, by Messrs. John King, Limited, Engineers, Liverpool, which has met with great success. Their system possesses the advantage of continually providing a large volume of fresh air, and in the winter time warming the fresh air as it enters the building. But the novelty of this arrangement is that it is carried out without extra cost for hot air ducts, or shafts, or hot air flues in the floors and walls of the building, and without having recourse to air propellers and engines. The heating surface, or heating power, is not buried in underground chambers, tunnels, or shafts; therefore, the cost of installing King's combined system is less than other systems hitherto used for warming the fresh air necessary for ventilation. Several patents have necessarily been associated with this dual service, and Messrs. King's "Tabular" design is, perhaps, the most noticeable, differing as it does from previous inventions. The point that strikes one as being specially noteworthy is the arrangement by which the four exhaust tubes are made independent of one another. The air passages are so formed and reciprocally arranged that the air must pass, but cannot enter the extract tubes. The appliances have already met with favour both at home and abroad. The railway companies have also employed this company largely warming and ventilating their station buildings, offices, etc.; also for warming the dining and sleeping saloons and railway carriages. For the warming and ventilation of these latter, Messrs. John King, Limited, have special appliances, and at the present time have in hand carriages for all the purposes of the newest and latest improved methods of railway locomotion, and have lately completed the directors' saloon of the L. & N.W. Railway. For one of these railway companies they have fitted up over twenty-five miles of piping for warming purposes.

## A ROAD-PAVING DISPUTE.

Mr. Justice Stirling gave judgment last week in the case of the Mayor and Corporation of West Hartlepool v. Robinson. The Corpora-

tion claimed £27 6s. 6d. and £328 3s. 4d. in respect of the paving and sewerage of two streets. It appeared that in 1878 the defendant was the owner of land forming part of the Lynnfield estate, until quite recently occupied by him for residential purposes. The owners of the adjoining land on the south were Messrs. Callender, Pape, and Wright, who, desirous of developing their property, applied to the West Hartlepool Improvement Commissioners to sanction a scheme for building purposes. A plan was submitted showing a proposed road 36 ft. wide, half on the land of the applicants and half on that of the defendant. The Commissioners sanctioned the proposed scheme, and a road was made, called the Sandringham Road, but in the first instance only 18 ft. wide, there being an agreement between the defendant and the Commissioners that he would thereafter contribute sufficient land on the north to give a street 36 ft. wide. In January, 1892, the Corporation ordered the paving and sewerage of the roads in question, being 18 ft. wide. None of the owners having, after notice, executed any part of the works, the Corporation proceeded to do them themselves. The cost of the works was then apportioned by the Borough Surveyor, and the amounts already mentioned were charged to the defendant, who refused to pay. It appeared that the defendant had afterwards thrown the agreed portion of his land into the road, making it 36 ft. wide, and that he had done the paving for that portion of the road, the claim now made being for the apportioned cost of making up the 18 ft. of road, which was not upon his land at all. The defence was that the order of the Corporation was inoperative against him, as he could not obey it without trespassing on land which did not belong to him. Mr. Justice Stirling, in giving judgment for the plaintiffs, said that the Act of Parliament imposed on persons whose lands abutted on a street certain duties, for the discharge of which they must enter on the street, and those duties were imposed irrespective of the circumstances, whether those persons were or were not owners of the soil of the street.

## THE GOVERNMENT AND FILE CONTRACTS.

A correspondent to the *Ironmonger* of last week writes as follows: "A discussion of a rather warm nature has been going on in the columns of the local Press on the subject of file contracts. The cause was a contract form issued on June 9th last year from the India Office, in which these words occur: 'The whole of the files are to be made of the best refined cast steel, machine-cut, sand-blasted, by the process of Messrs. Tilghman.' A deputation representing the Filecutters' Union waited upon the Right Hon. A. J. Mundella, M.P., on the subject, with the result that that gentleman promised to bring the matter before the officials more immediately concerned, with a view to obtaining a remedy. The statement of the workmen's deputation has since been contradicted; but our representative has himself seen the specifications of the India Office which contain the clause quoted above. They are remarkable as showing that in the space of twelve months the opinion of the officials had veered round from one extreme to the other. A very few months back a soft summer wind was fanning the hand-cutters, now they are assailed with the keenest and most bitter of trade winds. Both sets of specifications entailed hardship upon the file manufacturers and workmen. Some one at the head of the India Office has blundered in one respect. But where, it is asked, can be obtained machine-cut files of the smallest types? Such files have never yet made their appearance in Sheffield. Such a specification as that which was issued from the India Office in June cannot be executed. The matter has been remedied in later specifications, and, so far as can be ascertained, there is now no injustice to any of the parties affected."

## S. E. RAILWAY EXTENSION.

The South-Eastern Railway Company has deposited in the Private Bill Office of the House of Commons an estimate of the capital expenditure which will have to be incurred in the event of their Bill of the present Session

receiving the sanction of Parliament. The total expenditure required is £782,826, of which the proposed relief railway, 1½ mile in length, commencing with the company's railway at Horselydown and passing through Bermondsey and Rotherhithe to a junction with their railway at Deptford, is estimated to cost no less than £438,194. With the exception of £9283, which will be expended upon widenings at Tonbridge, the whole of the balance of £335,349 will be spent upon widenings between Charing Cross, Waterloo, and Cannon Street; and between London Bridge, Bermondsey, and Deptford.

## LOCAL GOVERNMENT ANNUAL, 1897.

Dorset House has issued a new edition of the Local Government Annual. This is the sixth year of a most useful publication, and Mr. Edgcombe Rogers has signalled the occasion by several careful additions to its former excellencies. The Rural District Councils now appear in alphabetical order, and the name of the local surveyor is given in each case. The same classification is applied to the County Boroughs and Sanitary Authorities. A new feature of practical value is afforded by the insertions of abstracts of the various Acts of Parliament relating to Local Government matters which have been placed on the Statute Book during the past year. The Annual exhibits an improvement also in its outward seeming, being printed in new type, and on a paper of sufficient quality.

## "NO MAN'S LAND."

Before the Croydon County magistrates, Captain Robert William Crow, of Stanley Road, Carsharlington, was summoned by the Carsharlington Urban District Council for allowing a nuisance to exist on certain premises of which he was the owner, viz., "Lyndon," Stanley Road. William Gale, the sanitary inspector for Carsharlington, said the general drainage was very bad indeed. The roof of the house itself was also very leaky and exceedingly filthy, the plaster dropping off the ceilings and the paper

coming off the walls from damp. The house was situated in a part of Carshalton known as "New Jerusalem." There were eleven persons living in the house. Mr Dennis (for the defendant): It is a sort of "No Man's Land," isn't it? Witness: I do not know. Mr Dennis: Do any of them pay any rent? Witness said he did not know. Mr Dennis said the tenant had been living in the house two years without paying a farthing rent. There were about 100 houses there and he did not suppose that two per cent. of them were inhabited. There were no windows, no doors, and no roofs, so what they wanted more ventilation for he did not know. The Bench made an order for the premises to be closed within fourteen days, and to remain so until they were made fit for human habitation, the defendant paying £1 costs.

### CONTRACTS OPEN.

**THE VESTRY of the PARISH of ST. MARY, BATTERSEA.**

TO CONTRACTORS AND OTHERS.

The Vestry of the Parish of St. Mary, Battersea, are prepared to receive TENDERS for the several WORKS and SERVICES, and for the SUPPLY of ARTICLES and MATERIALS as undermentioned, for One, Two, or Three Years, at the option of the Vestry, from the 26th March next:—

Horse Hire, (Road Cleansing, Watering, &c.).  
Circular Bass Brooms for Sweeping Machines.  
Scavengers' Bass Brooms.  
Oils, Soaps, &c.  
Coal and Coke.  
Disinfectants.  
Bricks, Cement, Lime, Slates, &c.  
Gravel and Flints.  
Ironmongery, &c.  
Paints, Oils, &c.  
Special Paints.  
Side Entrance Covers, &c.  
Stoneware Pipes, &c.  
Street Lamp Columns, &c.

Timber and other materials for Carpenters' and Joiners' Work.  
Timber and other materials for Wheelwrights' Work.

Tools, &c.  
Unloading Barges.  
York Paving, &c.  
Iron Bars, &c., for Blacksmiths' Work.  
Horse Hire (Removal of Dust).

Also for the SUPPLY of GUERNSEY and ALDERNEY GRANITE, CORNISH and ENDERBY or NARBOROUGH STONE, the REMOVAL of ROAD GRIT, SLOP, and SWEEPINGS by BARGE or TRUCK, the REMOVAL of MANURE, the REMOVAL of CLINKERS, FINE ASH, FLUE DUST, &c., from the Dust Depot, and SHOEING HORSES for One Year.

Samples of the Granite and Stone (one-third of a yard) and Scavengers' Bass Brooms must be delivered at the Municipal-buildings, Lavender Hill, before FOUR o'clock on WEDNESDAY, the 10th FEBRUARY, at the cost of the persons Tendering.

Specifications and forms of Tender and further particulars may be obtained of the Surveyor to the Vestry, Mr J. T. PILDITCH, at the Municipal-buildings, on and after MONDAY next, the 1st FEBRUARY, between the hours of TEN a.m. and FOUR p.m. (Saturdays between TEN a.m. and ONE p.m.), and no Tender will be considered unless the same be made upon the official form, and samples are forwarded as required.

Tenders, which must be in separate envelopes, sealed, and marked on the outside, "Tender for ——" must be delivered to me at the Municipal-buildings before FOUR o'clock on WEDNESDAY, FEBRUARY 10th, and, with the exception of the Tenders for oils, soaps, &c., paints, &c., the removal of manure and shoeing horses, must contain the names and addresses of two responsible persons who are willing to join the contractor in a Contract for the due execution of the same.

All Contracts will be prepared by and at the expense of the Vestry.

Persons Tendering will be required to declare in their Tender that they pay the Trade Union rate of wages, and must append to the Tender a schedule of the wages paid to the various classes of workmen employed by them at the time of Tendering.

The Vestry do not bind themselves to accept the lowest or any Tender.

By Order,

W. MARCUS WILKINS,

Vestry Clerk.

Municipal-buildings,  
Lavender-hill, S.W.  
January 26th, 1897.

### SHEFFIELD UNITED GAS LIGHT COMPANY.

RETORT HOUSE AND COAL STORES.

TO BUILDERS AND CONTRACTORS.  
The Directors of this Company invite TENDERS for the ERECTION of RETORT HOUSE, COAL STORES, &c., including foundations and drainage work in connection therewith at their Grimesthorpe Station.

The main buildings are 351ft. long by 146ft. wide, and 44ft. high to eaves, and the foundations and drainage will comprise some 7500 cubic yards of excavation, 3400 cubic yards of cement concrete, 1100ft. run of 18in. brick barrel drain, &c.

Drawings and specifications may be seen, and bill of quantities, with form of Tender, obtained on application to the Engineer, Mr. FLETCHER W. STEVENSON, on payment of One Guinea, which will be returned on receipt of a bona-fide Tender. Sealed Tenders, endorsed "Tender for Retort House," must be delivered by post to the undersigned, at the Company's Offices, not later than the first post on SATURDAY, the 27th inst.

The Directors do not bind themselves to accept the lowest or any Tender.

HANBURY THOMAS,

General Manager and Secretary.

Commercial-street,  
Sheffield,  
February 2nd, 1897.

### TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be a caption unless they contain the name of the Architect or Surveyor for the Work.

### CONTRACTS OPEN.

#### ASYLUMS' COMMITTEE of the LONDON COUNTY COUNCIL.

TO BUILDERS AND CONTRACTORS.  
The Asylums Committee are prepared to receive TENDERS for the FOUNDATIONS of the Seventh County Lunatic Asylum, to be erected on the Horton Estate, Surrey.

Instructions for Tender and forms of Tender and contract, with specification and schedule of prices, and other schedules thereto annexed, can be obtained from the Clerk of the Committee, 21, Whitehall-place, S.W., on or after FEBRUARY 1st, 1897, on payment of £5 for each copy, for which a receipt will be given, and the drawings can then be inspected at the office of the Architect, Mr. G. T. Hine, 35, Parliament-street, S.W., between the hours of TEN and FIVE. The amount deposited will, after the Committee have come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide Tender and shall not have withdrawn the same.

Tenders must be on the printed form, and be accompanied by the forms of contract and schedules thereto and bond.

The Tender and accompanying documents completed in accordance with the instructions, must be enclosed in the authorised sealed cover, endorsed "Horton Asylum Foundations," and be delivered at the office of the Committee, 21, Whitehall-place, S.W., not later than TWELVE o'clock at noon, on MONDAY, FEBRUARY 2nd, 1897, after which no Tender will be received.

Any Tender not made on the printed form or not filled up and complete in every particular in accordance with the instructions will be rejected.

The Committee do not bind themselves to accept the lowest or any Tender.

The contractor will have to enter into a bond in the penal sum of £3000 with two approved securities each in the sum of £1500 as security for the due performance of the contract.

R. W. PARTRIDGE,  
Clerk of the Asylums Committee.

Asylums Committee Office,  
No. 21, Whitehall-place, S.W.  
January 27th, 1897.

### WALTHAMSTOW SCHOOL BOARD.

TO BUILDERS.

The Walthamstow School Board invite TENDERS for the ERECTION of NEW SCHOOL BUILDINGS in Wood-street, Walthamstow.

Plans and specification may be seen, and bills of quantities obtained, on and after Monday, the 15th inst., at the Offices of the Architect, Mr. W. A. LONGMORE, F.R.I.B.A., 7, Gt. Abbe-street, Whitechapel, between the hours of TEN a.m. and FOUR p.m. except on Saturdays.

A £5 note must be deposited for the quantities, and another £5 note must be inclosed with Tender, both of which will be returned to those sending in bona-fide Tenders.

Tenders, to be endorsed "Tenders for New Schools,"

and addressed to the Clerk of the School Board, "Cleveland," High-street, Walthamstow, and delivered not later than FOUR o'clock p.m. on TUESDAY, the 23rd inst., on which day at HALF-PAST EIGHT o'clock p.m. they will be opened.

The Board do not bind themselves to accept the lowest or any Tender.

N.B.—Any persons or firm Tendering will be required to make a declaration that they will pay all workmen employed by them on the above work for the Board the fully recognised London rate of wages, and will observe such hours of labour as are generally accepted as fair in their trade.

T. W. LIDDIARD,  
School Board Offices, Clerk to the Board  
High-street, Walthamstow,  
February 3rd, 1897.

## PLANNING OF SMALL HOUSES.

By H. V. LANCHESTER, A.R.I.B.A.

### No. 1.—A TERRACE HOUSE AT £70.

IT may often appear strange that though by far the larger proportion of small houses are erected by builders acting on their own initiative, so little has been done outside the architectural world in the development of these towards really good arrangement and design. On consideration, however, it may easily be accounted for by the fact that the speculative builder, depending, as he does, on the suffrages of the general public, is not likely to depart from the recognised type of plan without considerable hesitation. Nevertheless, it is evident that of late years there has been a preference for houses varying from the regulation model, even if the latter represented the best possible arrangement, which is open to doubt.

Many of the more enterprising builders have taken advantage of the modern spirit to put up buildings widely varying in type, but I fear that in most cases the variations can hardly meet with unqualified commendation, resulting, as they too often do, in ill-considered arrangements and trivial design.

In the small house, the problems involved in the proper distribution and relative placing of the various rooms are fortunately simple; they may be divided into two classes, viz., those common to all house-planning, and those incidental to special cases.

Under the first of these one may place such matters as the comfortable arrangement of entrances, convenience in access from one part to another, reasonable privacy for the various rooms; and, as regards each, a satisfactory correlation between door, window, and fireplace.

Under the second come the questions of aspect, levels, the various outlooks, the proportionate amount of space to be given to various purposes (differing, for instance, in town and country), and all those depending on the form of the buildings, whether detached, semi-detached, or in terraces, involving special consideration as to lighting, &c.

There are naturally but few cases in which some compromise has not to be made by sacrificing the lesser good to the greater, and particularly in the case of building on commercial lines is it imperative to subordinate one's ideal arrangements to economy

of space and simplicity of construction, as the public for which the ready-made house caters is too apt to judge its bargain by the primitive standard of absolute accommodation, and to find out the comforts of well-considered detail only after the practical test of occupation. That such economy and simplicity are, however, compatible with better and more interesting plans than many of those in

general use, it shall be my endeavour to show.

The series of plans for small houses, heralded by this short article, will not present any features of exceptional originality, but will suggest such modifications on the conventional types as would give a greater degree of comfort, without increasing the size beyond the minimum required for the accommodation provided.

NO. 1 TERRACE HOUSE — 16 FT. FRONTAGE — CUBE AT 10 = £70

It would be as well to note a few of the most important practical points to be considered in designing domestic work. The sitting-rooms should be grouped together, and while easily accessible from the principal entrance, should be, if possible, screened to some extent from it, particularly if it faces the north or east. The dining-room naturally falls on the side adjoining the kitchen offices, and the line of service should avoid the route between the

sitting-rooms and entrance, and also, if practicable, that between sitting-rooms and staircase. Where a small service pantry between kitchen and dining-room (with a hatch into the latter) is admissible, it should certainly be provided, as it has the additional advantage of forming a lobby to the kitchen, and preventing the smell of cooking from passing into the rest of the house. A degree of privacy in the bedrooms is desirable, but where these are, as is usual, on a separate floor or floors, this requires less consideration. The most noticeable necessity of the upper floor is the placing of the bathroom, &c., over or near the kitchen offices, so that all supplies should have as short a run as possible. It seems hardly necessary to mention the fact that doors should not be placed in the same wall as the fireplace, and should, if possible, be kept at a distance from it. If the former arrangement is unavoidable, the best way to deal with it is by forming a recess to the fireplace by a short screen between it and the door, as in sketch. The clashing of doorways and fireplaces is a fruitful source of difficulty in planning, as chimneys are always more satisfactory and less liable to smoke when on the inner walls of a house, and the doors naturally open from a more or less central part. It will be found that in all detached houses they seem to have an innate tendency to come together; in semi-detached or terrace houses the difficulty is less.

The best position of window with regard to the fireplace is also shown in the small sketch. This enables one to sit near the fire, and obtain left-hand light for writing, &c. If this is not practicable, the window should be on the other side of fireplace rather than directly opposite.

The relation of door and fireplace is slightly less important in the bedrooms, but the former should be hung so as to screen the bed. Some of the bedrooms should always be arranged with the side of the bed towards the window, as many cannot sleep in any other position.

With houses placed close together, as in suburban streets, there are not many alternatives as to the placing of the various sitting-rooms, one almost invariably looks towards the road and the other one over the garden; where there is a third, it will usually be best placed on the more sunny side, as we get little enough sun in this climate, especially in the proximity of large towns. An exception may be made to this rule in favour of the garden front, where there is a liberal amount of ground, or the outlook is a good one. On a site of an acre or so it is best that all sitting-rooms should face somewhat away from the entrance, and that all should have a fair amount of sun unless they are required to be used for any special purpose, as that of studio for instance. The room used for dining should receive the morning sun in preference to other

aspects. The suburban house will, however, be more attractive if one sitting-room, at least, overlook the road, so that the monotony of existence may be broken by the critical inspection of Mrs. A.'s new mantle, or Mr. B.'s latest acquisition in the equine or canine world.

Other considerations crowd in on one, such as the adaptation of plan to sites of irregular shape and varying level. These special circumstances may offer substantial advantages if carefully studied, but far too often a stock design is dropped on to the site where a little thought would have produced a more satisfactory result at a reduction in the expenditure. In most cases these differences are not of sufficiently uniform a character to enable one to make any general suggestions towards meeting them, but in one or two cases plans will be given adapted to a position where the surface of the ground is inclined. Each plan will be accompanied by a note of the amount obtained by calculating the cubic contents of the building at one penny per foot, so that the cost can be almost instantly arrived at by the multiplication of this sum by the price per foot cube that the reader's experience dictates. This would vary from 4½d. to 8d., according to the class of building and the locality.

The plan No. 1 accompanying these notes is one in very general use in the suburbs of London, with a few modifications that somewhat improve it in respect of comfort and compactness, such, for instance, as the form of drawing-room, and the increased width gained by interlocking the dining-room fireplaces. At the best, however, the rooms of a house built on a sixteen-foot plot must be somewhat cramped and inadequate.

H. V. LANCHESTER.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.

BY ALEXANDER DREW.

### INTRODUCTION.

THE introduction of iron and steel into roof-framing is of comparatively recent origin, and, did time permit, it might form an interesting study to gradually trace its progress from that of a few bolts and connection plates, employed to strengthen the various joints of the timber trussing, upwards through the several stages where it came to replace first the minor tension bars, then all tension members, till we finally reach the complete transformation stage where all timber has gone; iron or steel bars of various sections and strengths taking its place throughout. Most of the large and complex structures we see covering large railway stations, and in such like situations, could not have been formed in timber, so that for this class of work iron and steel has no rivals; but in the smaller and simpler forms of roof framing to be met with in ordinary practice, timber is yet used to a considerable extent, though I feel sure that even this will in time be set aside for iron or steel. And it is only natural that it should be so, since these latter materials possess so many advantages in strength, lightness, economy, and freedom from risk of fire.

Iron and steel are in reality but modifications of the same material, the chemical difference being very slight, though the mechanical difference is considerable; and it will prevent some repetition if I merely refer to iron throughout this paper, it being understood by this that, unless distinctly stated otherwise, both iron and steel are included in the one name.

But iron, when applied to roof framework, or in fact to any other use, must be treated on the lines best adapted to bring out its good qualities, if we are to get the fullest benefit therefrom; and as its nature and properties differ materially from timber in many respects, the lines or rules governing the application of timber require considerable modification to make them fully applicable to iron. If we compare these two materials with one another in their capacity to resist compression and tension, we find that good timber acts fairly well in compression, but is prac-

tically useless as a tie; not so much on account of its weakness in tension, as from the great difficulty of forming an economical junction at its ends, its shearing strength in the direction of the fibre being extremely small. Iron bars can be employed in many different forms of cross-section as efficient struts, while as ties the ends can be shaped to meet any requirement of the stress at these points.

Sir F. J. Bramwell, in his presidential address to the members of the Institute of Civil Engineers in 1885, very happily expressed the advantages iron possessed over timber, both in this respect and as regards its less liability to decay, and greater freedom from fire-risk; when he said:—"The engineer of to-day, in a country like England, refrains from using wood. He can't cast it into form, he can't weld it; glue (even if marine) would hardly be looked upon as an efficient substitute for a weld, and the fact is, that it is practically impossible to lay hold of timber, when employed for tensile purposes, so as to obtain anything approaching to the full tensile strength. If it be desired to utilise metals for such a purpose, they may be swelled out into appropriate 'eyes' to receive the needed connections; but this cannot be done with wood, for the only way of making an enlarged eye in wood is by taking a piece that is big enough to form the eye, and then cutting away the superfluous portions of the body. Moreover, when too much exposed to the weather, and when too much covered up, wood has an evil habit of rotting, compared with the rapidity of which mode of decay, the oxidizing of metals is unimportant. Further, our daily experience of the way in which a housemaid prepares a fire for lighting is suggestive of the undesirability of the introduction of resinous sticks of timber, even although they may be large sticks, into our buildings."

This inherent weakness of timber as a tension member was well known in the past, and the types of framework then utilized were chosen with the object of keeping the tensile strains as low as possible, to suit the material then in use. But with the advent of iron the necessity for this limitation ceased, and as a result the number of available types of trussing was considerably increased; but this, in turn, called for greater care and experience to determine the best possible type to suit any given condition.

With timber, the several members of the truss were almost invariably rectangular in section, and usually ran in stock or standard sizes; but in iron we have now a large variety of sections in round, flat, angle, &c., channel, and other shapes, each of these being available through a large range of sizes; and the choice of the most suitable section for the particular purpose still further increases the difficulty in designing a thoroughly practical truss. If, then, the use of iron as a substitute for timber in roof-framing introduces these special difficulties in the way of choosing, not only the type of truss, but also the particular section best suited for the several members of that truss, it necessarily follows that the designer must be specially trained to enable him to produce a thoroughly practical and economical result.

But while this is, strictly speaking, true for all conditions, I believe that in the case of small span trusses of ordinary type, say up to 40ft. or 45ft., sufficient knowledge might be acquired by careful attention given throughout a suitable course of lectures, or even by hard book study (if the right book or books could be got) so that the designer need not fall into serious error, and which would ensure the result being at least practical and safe, if not the best and most economical. But unfortunately the majority of the lecture courses at Universities or Science Colleges, while eminently suitable for one who desires to make a special study of the subject, always embraces much more than is sufficient for the Architect's requirements, and demands a much larger amount of time and attention than he can profitably give to it. And I fear the same unfortunate and unsatisfactory condition exists if we turn to books, for I feel sure that anyone who may have had occasion to refer to so-called text-books on the subject

steel and iron roofing must have been truck with the fact that what I would call *useful and reliable practical information* is rarely to be found anywhere. The theoretical side of the subject is comparatively little dealt with—though I think considerable improvement might be introduced even here—t if the anxious inquirer expects his book to enable him to readily determine the most suitable type or design of roof truss for any given span and loading; the best practical method and scantling for the several members of that truss; or how these members can be joined and best connected together at their junction; I fear he is doomed to disappointment.

I believe it is the want of this reliable, practical information, and the consequent natural hesitation to tackle a subject he is not fully acquainted with, which forces many Architects to ask contractors to design their roofs as well as to quote prices for supplying them. Up till quite recently I had been for a considerable number of years connected with several of the leading instructional engineers both in Scotland and England, and my experience has all along been that a very considerable share of the time and attention of the office staff is taken up in designing roofs to suit the special requirements of different Architects. Numerous contractors are quite willing to do this work, free of charge, hoping thereby to get some advantage over their competitors; but a little consideration will, I think, show that such a course is not to be commended. In the first place, the contractor must cut his scantlings as fine as he can, and keep down the cost of manufacture to its lowest point, if he is to have a chance against his opponents, who have no doubt also been approached by the Architect; then again, as his work is of a very speculative nature, and is often productive of no return to him, it is not to be expected that any more time will be spent on it than is absolutely necessary; the consequence is that his design is frequently not the best for the given conditions, and the scantlings may be badly proportioned. These results are often due to the thoughtless use of some previously made design, or standard drawing, so as to save time and expense; this design having probably been produced to suit some different requirement from that to which it is later on applied. Of course, you may say, the Architect can check all this, but does he always do so? Very few, if any, contractors will supply sufficiently full scantlings and details to allow their designs to be thoroughly checked; and if he be one of some standing, who might be held responsible should trouble arise, there is thought to be less need of worrying over, or watching such details.

Roofs may be roughly divided into two classes, temporary and permanent structures, the former being required only for a comparatively short space of time, while the latter is expected to remain in use for a more or less indefinitely long period. With the former class, the design and scantlings may be rightly kept light and cheap, if I may so express it; but as by far the greater number of roofs designed and erected are meant to be permanent, it must be kept in mind that it is not only defective material and bad workmanship which limits the life of any structure, particularly one of iron. Thus an iron roof frame or truss may be correctly proportioned for certain conditions, and be of good workmanship, but if these conditions be not what it is called upon to resist, there is considerable risk of a breakdown. The mistake is frequently made of assuming that if the total load to be carried be approximately the same, the type or design of truss is more or less a matter of taste, but this is far from being so—or, the correctly proportioned truss may have its scantlings cut so fine that the natural deterioration due to rusting will so weaken the originally sufficiently strong structure as to render it dangerous in the course of a comparatively few years. I am far from arguing in favour of excess in material, as such is equally indefensible; but let all the conditions or influences acting in the present, and likely to act in the future, be carefully considered, and

allowed for as far as our knowledge permits, and we have done our best.

Let us now go briefly over the various points which must be considered to enable us to correctly design a roof truss, and having noted these, we shall be in a position to see how far existing books or lectures will help us in acquiring sufficient knowledge and experience to justify our undertaking to design any ordinary roof truss, of a size up to about the limit previously noted, say 40ft. to 45ft. span. I shall do little more than mention the several points at present, as each will be taken up in turn and carefully considered later on in the course.

Beginning then with the roof covering, this is a matter which is generally settled for us. It may be tiles, or slates, with an under covering of timber purlins and sarking, or it may be corrugated sheet-iron carried on iron purlins, but whatever it be there need be no great difficulty in determining the area of covering which each roof-truss supports, and the total weight of this. It may happen that a particular rise or slope of roof is determined by some architectural or other requirement; or this may be left for us to settle. In this latter case the nature of the covering must be taken into account; for what would suit say for corrugated sheets is likely to be quite unsuitable for tiles or slates; and even a difference of locality—particularly if that be to some foreign, and it may be tropical, country—may entail an alteration in the slope of the same covering, to suit particular local conditions.

Then the lower member of the truss may be utilised to carry a ceiling, or such like; and the dead weight of this must be calculated. When all this has been done, we may guess at the weight of the truss itself; checking this guess, and, if necessary, correcting our work afterwards; and thus we arrive at the total *steady or dead load*.

The *live loads* are those due to snow and to wind. Snow is not a very heavy or important item in itself, for it is very rare indeed that it is not blown completely off the roof when a high wind arises; and unless there be some formation or arrangement of the roof which would allow it to accumulate to a dangerous extent—as in the valley of double span buildings—a load of a few pounds per square foot of roof surface is sufficient allowance for it. The wind pressure is an item of considerable importance, but its real value is very uncertain, and authorities differ vastly on this point. For the time being let us assume that we have settled this item, and with the complete dead and live loads calculated, are ready to advance a stage further. I should note here, that I have assumed there are no other *moving or live loads* on the roof we are considering than those due to snow and wind, though it is possible the ties may be further loaded by swings, as in a gymnasium, or by shafting or hoists, as is likely to be the case in a workshop; should this be so, these extra live loads would be simply added to the previous list.

The outline, or type of truss, has now to be settled on, the special points to be kept in view here being that each member should as far as possible be subjected to only one kind of stress, that is to say to either tension, compression, or shearing, and not to a combination of these stresses; and that each should be placed in as advantageous a position as is practicable to withstand the stress which it is called upon to sustain. The two special points to remember in determining the arrangement of the bracing for our truss, is first, that the scantling or required cross-section of a tie is for all practical purposes proportionate to the stress it has to sustain, and is not affected by any variation in its length; while the scantling of a strut or compression member increases rapidly with any increase in its length. Thus it should be our aim, where practicable, to keep the struts as short as possible, little or no attention being necessary in this respect with the ties.

There is one other point of equal importance, which refers, however, to the two principal members of the truss, the rafter and the main tie; I allude to the angle formed by the

junction of the rafter and tie at the shoe. This angle very largely governs the maximum stress in these two members; the larger the angle the less the stress, and the more acute the angle is made, the greater does the stress become. I fear that some Architects are at times liable to overlook this point, as I can recall many instances where the skeleton outline of some required roof-truss has been filled in on the drawings, and has been worked to by the contractor, where this angle has been needlessly, or perhaps I should rather say heedlessly curtailed, it may be by unnecessarily raising the main tie in the centre, with what I may call a corresponding loss in the efficiency, and possible increase in the cost of the roof. With the outline or type determined on, and the dead and live loads worked out, the stresses on the several members of the truss may be next got at; and till a considerable amount of experience has been acquired, and what I may almost call the practical instinct has been developed, it may be necessary to test two or three different types of truss, calculating the stresses on the several members of each, and comparing them with one another, if it is desired to conscientiously arrive at the best and most economical truss.

Up till now the work has been mainly theoretical, but beyond this the need of practical guidance will be most felt. With the large variety of sections and sizes of iron and steel bars now available, considerable difficulty is likely to be experienced in settling on the most suitable. Rafters, though generally made tee-shaped, might occasionally be of angles, particularly in small spans; or again for large or very heavy roofs, or where considerable width on top of rafter is desired, double angle, or even double channel shaped bars have been used. Struts may be of single or double bars, either of flat, angle, tee, or channel section, or it may be of solid or hollow round section, or they may even be of cast iron. Ties may be of round or flat section, or if they have to resist transverse bending, as when the main tie is called upon to support a ceiling, the section may be flat, angle, tee, channel, or even H section, as used for rolled joists.

The methods by which the several bars may be connected together at their meeting-points can be varied almost indefinitely, and here particularly the practical element comes into play. The best junction is that which achieves its object in the most direct way, and which entails the use of the least amount of material and work, particularly of skilled work; but this saving in material and work must not be got at the expense of the efficiency of the joint; for as the strength of a chain is that of its weakest link, so the strength of a roof truss is that of its weakest point, whether that be one of the members itself, or some connection of one member with another. This question of the reduction as far as possible in the amount of skilled labour involved in the making of a roof truss, is one of vital importance, not only as a means of bringing down the cost, but also in some ways of raising the efficiency of the truss. I allude mainly to the benefit to be got by reducing as far as possible the forging and welding necessary on the ties. In many cases the roof trussing is covered up altogether, or it may be placed in such a position as to be quite invisible as regards the details of its construction; yet how often do we see, in conditions like this, elaborately designed eyes and jaws to the ties, which entail a large amount of expensive and difficult forging and welding. No matter how skilful the workman is, he himself cannot be absolutely sure of always producing a perfect weld; and as the only proof that is often to be had of the weld being defective is got when it gives way, the great desirability of keeping clear as much as possible from such things is self-evident.

I would define a *thoroughly practical roof truss* as one in which the type or outline has been carefully chosen with reference to the dead and live loads it has to support, and is such that the various members of the framework are each at their best position to resist the several strains they have to bear; the form or cross-section of each member should be such as will not only give the greatest resistance per unit of section to the particular

strain to which it is subjected—the total section being of course proportionate to the maximum total strain—but the section should also be such as will best lend itself to forming practical connections with its neighbours; and in all this the details should be as simple as is consistent with thorough efficiency, so that the cost of manufacture may be reduced to a minimum.

Thus efficiency is got by carefully considering the type of framework, the form of the section for the several members, and the practical jointing of these latter together; while sufficiency is secured by taking specially into account the external influences which tend to deteriorate or weaken the structure—as rusting, and the effects of repeatedly applied stresses, &c.—and knowing the life, or length of time the structure is desired to remain in use, making the strength of the whole sufficient to resist these various actions or effects for the desired length of time. Thus the value or amount of this sufficiency determines whether the structure is likely to be a permanent or a temporary one.

How far then will books help us to settle the several points just noted? As I have already said, the theoretical side of the subject is comparatively fully dealt with. I would say, that from the Architect or practical engineer's point of view, it is too fully dealt with, for what business or practical man could find time to plod laboriously through page after page of elaborate and complex formulae and methods of determining the exact stresses on the various members of his truss, perhaps to 3 or 4 decimal places of figures; and who is it who could find time or patience to use such elaboration in practice.

The iron or steel employed to make a roof truss is by no means of an absolutely uniform nature, and in specifying its desired strength, a maximum and minimum value of say 24 and 20 tons per square inch for the breaking tensile strength of wrought iron, or 32 and 28 tons for steel, is quite common, thus giving a permissible variation of say 15 to 20 per cent. in the strength. Then the factor of safety should not be less than 3, and is usually 4 or 5. With such a wide variation in the quality of the material, and such a substantial factor of safety, where is the value to the busy practical designer of the elaboration so often seen in text books? As a species of mental gymnastics to the individual who has the time and inclination to indulge in such, it no doubt has its attractions, but what is wanted in the business world is a few simple and easily applied formulae or methods which will quickly give the desired answers with moderate exactness. I have no wish to belittle the value of a thoroughly theoretical knowledge, but such is quite unnecessary to the practical designer who has to deal with materials the qualities of which are far from perfect and uniform, and who consequently has no inducement to seek after great exactness in his calculations, particularly if this exactness is only to be got by increased labour and loss of time to himself; he has much more need to devote his spare time to the development of his practical knowledge and common sense, if he desires to produce good work.

To emphasize the necessity of practice going along with theory, I shall very briefly quote from the utterances of two well-known engineers.

In his presidential address to the Institute of Electrical Engineers about three years ago, Mr. Alexander Siemens said: "In most cases the conclusions of pure science have to be modified by practical considerations before a useful application of science can be produced." To apply this statement to what I have just been saying, I might venture to freely translate it thus: *Complex and unnecessarily exact theoretical formulæ must be simplified and made easy of application, if they are to be of real use to the practical engineer.* The second quotation I wish to make is from the address given by Professor A. B. W. Kennedy to the Mechanical Science Section (G) of the British Association at their meeting in Oxford in 1894. He said: "The determination of the stresses is in nearly every case by far the easiest part of the designing; a large amount of practical experience

and common sense is necessary to translate the formulae of text-books or class-rooms into satisfactory structures."

It is just at this point, where practical experience and common sense is most wanted, that text-books break down. I may take the opportunity further on in the course, when we are considering the several points previously referred to, of pointing out how imperfect, and often misleading, some of the so-called practical details given in different text-books are, as I can then compare them with what I consider good examples, and thus enable you the better to understand the objectionable points. It is not by studying good examples only that we are likely to derive benefit, for even bad examples, when we can clearly recognise them as such, are often very instructive in what I would call a negative, or how-not-to-do-it manner; the difficulty and danger to the learner however, in a case like this, lies mainly in his possible inability to recognise and profit by the good and bad examples he is likely to meet with in his study.

I will not waste time here in further emphasising the great difficulty likely to be experienced in any attempt to get at good practical information, but would recommend all who may possess text-books likely to treat of the designing of iron and steel roofing to refer to these, and note how many pages are given over to the practical considerations of this subject; in the majority of cases, I think, they will find that such information is conspicuous by its absence. Even what little is given, particularly if it be in the form of tables of stresses or scantlings, is often of but limited use. Thus take the four tables of scantlings for iron roofs given on page 68 and 69 of Hurst's Pocket-book, 13th edition, and we find that all are for one definite slope of covering ( $=\frac{1}{4}$ th rise), but for varying distances apart of trusses (6, 8, and 10 feet); and, as the general note preceding the tables says, they give the usually adopted proportions "when the roofs are covered with slates." Is it necessary to point out to any one present the vagueness of this last statement? You are all aware that the weight of a slate covering depends both on the quality and lapping of the slates, and that a variation of from 30 to 40 per cent. may be got by altering these particulars; and, looking at this one point alone, it follows that if the given scantlings are right for one particular quality and style of slating, they must be considerably out for many other equally permissible styles. Again, the rise throughout being fixed at  $\frac{1}{4}$ th of the span, implies that the information is not reliable for any variation in this particular.

Of course, I am aware there are one or two books published which confine themselves largely to practical details and information, but little or no effort is made to classify these details, or give reasons for their use; and as the learner is likely to find one detail apparently contradicting another, where he very naturally expects there should be an agreement, the actual help he is likely to derive from such books is, I fear, small. Afterwards, when the student has acquired a fair grasp of the subject, and can more or less readily pick out the good from the bad, and maybe even work out by himself the reasons for the employment of a certain detail, then it is that such books may be profitably made use of for reference, or as a means of extending his practical grasp of this subject.

I may here also refer to the number of books brought out, which elaborately describe and illustrate certain existing structures; or to the illustrated engineering and architectural magazines, which from time to time publish such information. Unless the student be well advanced, I fear but little real instruction is to be got by an exhaustive study of such designs; for to fully appreciate the details given, all the data and calculations employed in the working out of these would require to be gone through, and such particulars are very rarely given. Again, very great care would require to be taken if an attempt were made to utilise such designs for some new structures; for a comparatively small change of dimensions or condition from that illustrated may so alter the stresses coming on the members of the

structure as will make the given details and scantlings quite inapplicable. The only safe course, assuming that the original designer was thoroughly competent, would be to exactly copy his work; and even if the circumstances permitted, few would, I think, care to blindly do this. In comparing the details and scantlings of actual structures with one another, even when these structures seem to be identical, rather disquieting irregularities are apt to be discovered. If the designs have been prepared by independent individuals, the differences are likely as much as anything to be due to the ideas each have of the safe stress which should be allowed to come on the material, and to the allowance which should be made for wind pressure. But it must also be remembered that an apparently insignificant alteration in design or condition may cause the same individual to considerably vary the scantlings, and this in a perfectly legitimate and justifiable manner. Unless, therefore, we can, as it were, go through exactly the same calculations and considerations as the original designer did, we are not in a position to accurately judge as the value of the design, or to fully profit by the good points it may contain.

To show how considerable may be the apparent discrepancy in scantlings between two designs, I will mention only one case, and that is taken from a publication which gives some particulars of a large number of iron structures built for various clients by the same firm of engineers. In comparing a 30ft. and a 46ft. span roof together, the type of trussing in each case being identical, and the other conditions fairly similar, we find that, while the scantlings of the rafters are proportioned much as we should expect, the main ties are in both cases of the same diameter! This may, or may not, admit of explanation, but it certainly appears sufficiently doubtful to warrant its being looked upon with considerable suspicion.

It will be noticed that up till now I have confined my remarks to iron roof principals or trusses only, those being by far the most important parts of the complete roofing.

If the covering be of any material other than iron or steel, the limitations imposed by the title of this article precludes me from considering that point further than is necessary to get at the weight of such covering, and any special requirements it may impose as to the slope of the rafters. Should the desired covering take the form of corrugated iron or steel sheets, I should be quite entitled to consider it fully.

With reference to the succeeding articles, the following is a general synopsis which will serve to show what points I propose considering:—Dead and Live Loads coming on Roofing, and how to allow for these; practical methods of determining stresses on Roof Members, Graphic Method, and Method of Moments, briefly touched on, with hints on their application; types of Roofs, good and bad; points to avoid, if possible, when outlining roof framework; simple members of framework—Struts, Ties, Beams, Beam-struts, Beam-ties, Bolts, and Rivets—their strengths, and practical values; practical forms of Rafters, Struts, and Ties; also Shoes, Junction, and Connection Plates, &c.; corrugated Sheets as used for Roof Covering; how they are laid and fixed; and the probable life of Sheets under different circumstances.

I think I need hardly point out how impossible it would be for me, in the course of five articles, to touch on all the points which should be gone over. I shall endeavour, however, to take up at least the vital points somewhat in detail, and touch on as many of the others as space will allow.

Preference will be given throughout to the simpler formulae and methods of calculation, even though the results thus arrived at be only approximate; and, wherever necessary, diagrams and tables will be given, so as to simplify my explanations, or help in the calculations.

ALEXANDER DREW.

It has been resolved to make considerable additions to the Portsmouth Hospital.

**Mr. Spier's Works  
at the Royal Water  
Colour Society Art  
Club.**

ARCHITECTURALLY the principal interest of this small Exhibition, which was open last week from Wednesday to Saturday, is the collection of drawings of Paris after the Commune, made by Mr. Phené Spiers, the well-known Master of the Royal Academy Architectural Schools. They number sixteen all told, and give a very graphic and realistic idea of the ruin wrought at that unhappy time. As they were all drawn

picture as a whole. This is an artistic result seldom met with, and could only exist in the work of an artist like Mr. Spiers. As we have said, all these drawings are worth seeing; but those that especially appealed to us for the reasons we have just given were No. 109, "Salle des Pas Perdus, Palais de Justice from the South-West," where the air of desolation is excellently given; the whole of the foreground is just a mass of ruined stone, broken ironwork, and bent girders. The huge twisted and charred girder, fallen from the floor above, and shown on the right-hand side of the drawing, is quite dramatic in effect. The colour-scheme, especially in the portions shown in reflected light, is very pleasant and luminous as a whole. No. 116, "Tuileries, West or Garden Front," is finely drawn in perspective and a most attractive picture. Delicate and sensitive in colour and in its pictorial and Architectural qualities. The effects of the fire here again is most cleverly indicated. Drawing No. 110, "Salle des Pas Perdus, Palais de Justice from North-East," is particularly good in its well-

drawings so valuable to a practical Architect. You can be as sure of his construction being right as of Mr. Wyllie's detail in the rigging of a vessel. Through the courtesy of Mr. Spiers, we have arranged for the reproduction of these drawings to appear in the "Architectural Review."

**An Election Farce  
at Beccles.**

THERE has just been played out at Beccles, in Norfolk, a pleasant little farce by the Town Council in the appointment of their Local Surveyor, which is worth more than a passing note. The ways of Town Councils are proverbially passing strange, and their methods at times are peculiar. It is quite clear, from a reading of the bare facts of the case, that there were certain members of the Council, evidently a majority too, who had a strong desire to see a son of a very particular friend of theirs appointed to the vacancy. But, being the "guardians of the public purse," and with

DESIGN FOR CHURCH DECORATION AT HAMPSTEAD. BY T. G. JACKSON, R.A.

on the spot, and, we believe, since untouched in any way, they form most valuable historical records, and convey in a manner no words could, the grim reality and the desolation of it all. They are by far the most interesting drawings in the Exhibition, and one returned to them again and again, fascinated in much the same manner as one would be by the buildings themselves at the time of their destruction. Each one of the drawings is worth careful attention, they all contain points of considerable interest, not only to the Artist, as regards the light and shade, composition, and so forth, admirable as it all is, but more especially to the Architect, who will notice that the points of construction and Architectural detail are excellently indicated, although in a properly subdued manner, so that the records of the construction rarely interfere with the artistic nature of the

balanced scheme of light and shade and colour, probably one of the best drawings in the set. No. 118 seems to suggest at once the awful destruction, and the brilliance and gaiety that have gone, although a certain other kind of brilliance is there still. Perhaps the most interesting drawing from a practical point of view is No. 119, "Hotel de Ville Paris Salle des Fetes," where the construction of the iron roof is most carefully recorded, together with the action of the fire upon it. Shown here and there by the ties and struts doubled up, bent in halves, or hanging down. These details are always shown in such a manner that if the ties and struts were straightened out they would fit again their proper places, even, so it looks, and we examined them pretty carefully, to the position of a bolt hole. It is this quality in Mr. Spiers' work, which always makes his

their eyes to the coming elections, they were anxious, of course, to pose as quite disinterested persons, men who would be the very last in the world to consent to any arrangement by which that aforesaid public purse should not be appealed in any way but that dictated by the most rigid economic principles, or by which the town should reap the greatest possible benefit. Now it is a very obvious thing that the Surveyorship in a county town like Beccles, with its proposed improvements, should be filled by a tried and experienced man, a man who not only has an irreproachable past record as a Surveyor, but one who should also be up-to-date in all the latest improvements in sanitary science, and, moreover, should bring to bear a mature and tried judgment upon them. In a word, he should be a man from whom there would be no danger of the town being mulcted

in unwise and rash experiments just because they happen to be "new." This is just the sort of thing one would expect would happen from youth and inexperience. The Town Council, however, know well how to guard against such a danger as this—externally at least—what the "inside" of the matter is is quite another thing, as will be seen soon. They advertised in all the leading building papers and in nearly all the important local ones for a competent man to fill the post at a salary of £100 a year, with the privilege of a private practice. This, for a small town, would be not at all a bad position, for he would doubtless have an Architectural connection as well. So far so good. In reply, they get no less than sixty-eight applications, many of them from tried and trusted servants, some of them Assistant-Surveyors, some Assistant-Engineers of important local towns, men of considerable and varied experience. One would naturally suppose that having these applications the Council would at least consider each one of them on their merits and elect the best qualified man. But they do nothing of the kind. To the amazement and bewilderment of their townsmen, they proceed forthwith to put up the names of three local candidates, and, without considering for a moment their merits, each man votes for his friend, with the result that the young and inexperienced son of a fellow Councillor is elected. They do this secretly and by ballot, but some too candid friend has been unkind enough to publish the "division list" in a local paper, which reveals the curious fact that the father, in a moment, of course, of absolute forgetfulness, in an absent-minded manner voted for his own son and afterwards coolly told the Council that he was quite sure they could not have done better, and hoped that what he did not know he hoped he would soon learn. We do not envy the ratepayers of this particular town at such a silly waste of their money, and under such a thin pretence of righteousness. We advise them to keep carefully this voting list, and remember all the names at the next elections. Seeing that the appointment has been duly made, we suppose it cannot now be altered. One thing the ratepayers can do, however: they can prevent these gentlemen playing such a trick upon them again, and they can do that by keeping them out of the Council.

King Leopold is going to Villefranche in March to lay the foundation-stone of his new villa.

#### GLASGOW SCHOOL OF ART.

A SECTION of last year's work of the students of the Glasgow School of Art is now on exhibition in the Corporation Galleries. It is plainly evident that a high standard of tuition in Art has been attained, even under the disadvantages of the unsuitable premises in which the school has been so long located. It seems, however, that the possession of a new building is within measurable distance of being at last realised. Besides the show

SKETCH PLAN.

of students' works of the year, there is to be seen in the galleries an exhibition of competitive designs for a new school.

It may be remembered that when the Art Gallery and Museum scheme for a building in Kelvingrove was proposed, a School of Art was also projected as part of the undertaking, and Architects were asked to include the necessary accommodation in their drawings. The accepted designs contained provision for a School of Art. The Parks and Galleries Trustees, however, found that administrative difficulties might arise between the Corporation and governors of the School of Art as joint but independent occupiers of the same building, and matters thus remained from 1892 to the present time. They have now, however, assumed a new complexion. The Bellahouston trustees have, conditionally, granted a bequest of £10,000, and the Town Council has allowed a grant of £5000, provided the necessary funds could be raised to build a suitable school. Other money also being forthcoming. Twelve Architects were invited to compete on conditions carefully drawn up, and Sir James King,

Bart., and Sir Renny Watson were appointed assessors, with powers to call in such professional aid as they might think necessary. The result was that the design of Messrs. John Honeyman and Kepple was chosen with the complete approval of the expert authorities at South Kensington. Consultation has been had by the Building Committee with the Architects, and building operations are to be at once commenced. The site purchased by the Bellahouston Trustees is that piece of land lying immediately to the north of the Panorama buildings

in Sauchiehall Street, between Dalhousie Street on the east and Scott Street on the west, and having a frontage to Renfrew Street. The building itself will face due north, with a length of 250ft. and a depth of 77ft. Owing to the conformation of the ground, the building at its south-west angle will have to be carried by a retaining wall. The plans selected show a three-storied building—a basement and two floors—the ground to the north being excavated to form an area for lighting the lowest floor. The entrance is in Renfrew Street, the main door being situated in the centre of the façade. A service door has also been made in Dalhousie Street for access to a janitor's house and for the reception of material. The staircase of the building is situated in the rear centre, and access to all floors is gained from and by it. The upper floor contains the life rooms (male and female), antique rooms (elementary and advanced), a school museum, and a board-room. The middle floor is occupied by ornament, still-life, and design rooms, and the school library and lecture theatre. The basement holds the accommodation for modelling (large antique and ornament), architectural rooms, and the technical rooms. In these will be placed a forge, a kiln, and a muffle. The basement also contains a house for a resident janitor, the heating apparatus, and various store rooms. The administration is situated in the centre of the building and on the first floor. The elevation presents the appearance of a plain business-looking edifice. The upper floor is lighted by large square-headed windows, and every care has been taken to secure a sufficiency of light for every room in the school. All rooms in which instruction is to be given are lighted from the north, the only light taken from the south being that available for the corridors, which on each floor run from one end of the building to the other, at the southern side of the edifice. The light from the south is obtained by the use of wells, there being no reservation in favour of windows in the southern wall. The whole of the plans will be on view in the Corporation Galleries till February 16th. The governors are at present contemplating building such portion of the plans as can be erected at a cost of £14,000, but they are hopeful that the whole of the sum necessary for the full consummation of the work will be raised in time to make the building operations a complete piece of work.

SWINDON Technical School, which has been erected at a cost of £12,000, was formally opened a few days ago.

SOME SCOTTISH HOUSES. SKETCH MAP.

## Some Scottish Houses.\*

By W. J. BLAIN.

**A**LTHOUGH it has been said Scottish people were devoid of wit, I have never heard the opinion ventured that they are devoid of the instinct of beauty. That the Celt was possessed of the Art feeling, and that in no small degree, is sufficiently evident from the beauty of his music, the picturesqueness of his costume, and the strange subtlety of his work in silver and brass ornaments, and it is only to the vicissitudes of a hard life that he owes the obscurity under which he labours with regard to the larger and more lasting Art of Architecture. On the other hand the Lowland Scot has produced works which, although comparatively small and plain in character, contain those elements of design which in the buildings of England and the Continent are often found wanting, and for which richness of detail and lavishness of Sculpture are often mistaken. But who would expect to find in the North-Eastern Counties of Scotland, a district devoid of all natural beauty, with its barren square-topped hills, stunted vegetation, and dearth of either the picturesque outline of the Highlands or the smooth expansive valleys of the Lowlands, nurtured by a people like the landscape—low-browed, square-faced, and who to the outsider would appear hard and unsympathetic—an Architecture the richest, most picturesque in the whole kingdom, native in its growth, original in its form, and manly in its conception, and yet in the valleys of the Dee and Don there remain houses of the 16th century equal to any on the Loire, and of a type not to be found in any other district of

Scotland. It is to these houses I purpose devoting my attention, the more so as they are comparatively unfamiliar to the Western student.

The Houses of Drum and Crathes are situated within a few miles of each other, on the rising ground on the north bank of the Dee, and about two miles from that river. They are easily reached from Aberdeen by the Ballater Railway, Drum Station being within one mile, and Crathes Station within two miles of the house; and as this two miles is through the most beautifully-wooded policies of the castle, there is no hardship in the walk. The valley of the Dee opens up, a few miles above Aberdeen, into a fertile strath extending for fifteen miles to the bend of the railway at Banchory. Here, a piece of rising ground closes in the head of the strath, and the bed of the river narrows in to the left, the railway making a detour to the right, to join the river again, ten miles further on, at Aboyne. The scenery here is of the most commonplace type, and has nothing of that picturesque grandeur which the river presents looking from Aboyne in the direction of Ballater, and the dark blue background of Lochnagar. The right bank of the river rises rather abruptly into those squat low-browed hills of Kincardineshire, covered with Scotch fir, which are so characteristic of the district. The bed of the valley, though fairly wooded, and prettily dotted with mansions along its course, is sadly marred by the broken, abrupt undulation of its contour, as if nature had placed these little eminences as a direct burlesque on the surrounding ugliness of the hills. The left bank rises rather slowly and smoothly, ascending gradually, until it finishes in the high hill of Fare, at the foot of which stand the houses of Drum and Crathes. The Castle of Drum consists of an old tower or keep of the 14th century, to which was added in 1619 the present house, consisting of a central hall with two square wings, and

grouping with the old tower to form a courtyard with boundary wall and entrance portico. There is nothing unusual about the old tower. It is the usual grim old keep of its period, with narrow slit windows, and finished with a square parapet and flat roof. The old hall, on the ground floor, is now turned into the library, and the walls are of such an extraordinary

### \* CRATHES:

SKETCH PLAN.

thickness that the ingoing of the solitary window to the north appears like a small room. The 17th century house has not the abiding strength of the old tower; the walls are comparatively thin, the rooms large and airy, the window openings big, and the modern doorway to the garden, with its fine flight of steps, large and inviting. It was built in more light-hearted times, and laughs and gambols round the old tower, like a child playing around the knees of an old warrior. A curious feature of this house is the connection of the side wings. These are merely pinned on to the corner of the main block, and are seemingly held together by an octagonal piece of walling containing a corkscrew stair, and finished with a round turret and cone roof. This forms a most pleasing piece of grouping—altogether this house shows a decided departure from the traditional Scottish type and a leaning towards the Renaissance, and, were it not for the beauty of its dormers, which are the finest I have seen, and the choice elaboration of the corbelling under the angle-pieces, it might easily be an English Baronial mansion. These dormers, five in number, of similar outline but varied design, show how the Scottish detail may be applied to modern uses, and therein the value of Drum consists. Anyone visiting Drum should not fail to see the Chapel. This is a little cell among the trees, a few yards from the house. Whether it was originally a Chapel in connection with the old tower I do not know, but it is used as such now. The charm of this little place, scarce half the size of this room, is beyond description; and as one enters by the tiny end door, scarce 6ft. high and Scotch pointed, nearly semi-circular, and feels the diffused light breaking its way through the small windows on one side, with the priest's door to the right, and the miniature altar raised two steps in front, with its altar-cloths, coloured dado, and tiny kneeling stools, one's cap instinctively comes off, and one feels as he has not for a long time. As you leave Drum you will feel sad, and at the end of the long avenue you will turn to have a last look at the house, with its fine old tower standing out square against the sky, and its pointed roofs blending harmoniously with the tree-tops, and you will say to yourself the new house may be prettier than the old tower, but the old tower is nobler than the new house. It is the combination of these principles of nobility and beauty which we will see developed in houses of Crathes, Craigievar, Midmar, and Castle Frazer.

The Castle of Crathes was built between the years 1553 and 1596 by Alexander Burnet, of Leyis, whose family had possessed the lands from the time of Bruce, and is now occupied by Sir Thos. Burnet of that family, with the additional comfort of a modern wing. The Burnets of that date, according to Billings, were men of refined taste and some literary ability, connected closely to the College of Aberdeen, and this is borne out by the charac-

CRATHES. SKETCHED FROM THE S.E.

\* A paper read before the Glasgow Architectural Association.

SKETCH OF CRATHES FROM THE S.W.

ter of their mansion, which, while retaining the strength and solidity necessary to protect it from the fierce marauding Lairds of the upper reaches of the Dee, is designed with such taste as to show that they either practised the Art of Architecture themselves, or had a fine discrimination in the choice of their builders. The house is built on the hillside, the ground being cut back to give it a level rest, and is of the usual form with staircase in the re-entering angle, the open angle facing down the valley, an arrangement which gives it a good grip of the ground and affords a fine view from the end window of the Great Hall. The plan in this case is rather difficult to follow, the staircase tower being extended to finish flush with the front gable, which is of an uncommon breadth, and is in reality a double gable filled in between in the most original fashion with a battlemented parapet. The plan consists of the usual kitchen and offices on the ground floor, the Great Hall occupying the main block on the first floor, with its barrel-vaulted roof, carved stone pendants and rich plaster panelling, and the tail of the L occupied as the customary drawing-room; above, the floors are used as bedrooms, and in the attic there is a fine long gallery with camceiled roof richly panelled and carved in oak, and extending the full length of the house. The most interesting feature in Crathes is the painting on the ceilings of the bedrooms. These are constructed of squarish timbers, say about 7in. by 5in., with the flooring above exposed. The timbers are finely axed, and are covered with the most delicate geometric ornament in light tones, tending to emphasize the long lines of the timbers, while the flooring is covered with full-size figures running through the joists, and representing historical and Biblical subjects, painted in strong dark colours, and brought into fine tone by the dark colour of the wood background, the emphatic line of the timbers counterbalancing that tendency to fall which is so much felt in painted plaster ceilings of the Classic Revival period. These paintings have been restored by the present occupier, who cannot be too much praised for the interest he takes in his house. The oak-

ceiling of the long gallery is also finely painted, but during my visit was being washed down previous to a similar restoration proposed by Sir Thomas Burnet. These paintings give one a very good impression of one of the forms of decoration of the period, and tend to disabuse one's mind of the ideas of savagery with which we generally associate the old nobility of Scotland. Externally, the building consists of four plain storeys, with fairly large openings and rounded corners with richly corbelled angle turrets in the attic storey, and dormer windows which, although not so refined in detail as those at Drum, are so designed that the building presents a most picturesque skyline while retaining that unity of mass which is so characteristic of Crathes.

To the poor Architectural student who is not in the habit of spending his superfluous money recklessly, the best way of getting to Craigievar is by taking the train from Crathes to Lumphanan, staying overnight in the hotel there, and walking in the morning to Craigievar, a distance of some five or six miles. Lumphanan is a pretty little village, situated on a small ravine, which breaks into the country on the far side of the hill of Fair.

Leaving Lumphanan and the valley of the Dee, and proceeding towards the Don at Alford, the country, as you ascend, assumes a barren, wild, and monotonous aspect, and the road winds in and out among these lonely hills and glens, until, suddenly turning the corner of a mound, a stream crosses your path, and you get the first glimpse of Craigievar Castle, surrounded by fine artificial wooding, and presenting, with its yellow, rough-cast surface and broken outline, an imposing picture amid the surrounding gloom.

Craigievar Castle is the seat of the Forbes family. It was purchased in a half-finished condition by William Forbes, a rich merchant, in 1611, and completed by him in 1626. The brother of William Forbes was Patrick Forbes, Bishop of Aberdeen at that time, a man of letters, and an ardent champion of Presby-

erianism. It is now occupied by Lord Semple, who is very careful to have the house remain in its original state, and it is thus one of the best preserved examples of its period.

Although now situated far from the general highway, the old road to the north was

## CRAIGIEVAR:

SKETCH PLAN.

through this district, past the Edwardian Fortress of Kildrumie, and must have been within measurable distance of Craigievar.

The plan, like Crathes, is L-shaped, clearly enough defined at the base, but corbelled out in such an extraordinary manner as to be almost lost in the upper storeys. The arrangement is also similar to Crathes, that is, the kitchen offices in the basement, great hall, and withdrawing room on the first floor, and bedrooms above; but in this case the re-entering tower is smaller, being occupied as an entrance vestibule on the ground floor with private room above, the staircase being situated in the main block between the hall and withdrawing room. The plan, too, is turned completely round, so that the open angle faces upwards, and the end windows of the great hall look into the hillside, a defect in planning which neutralizes the view from the hall, and does away with that grip of the ground which was so beneficial to Crathes, and which I will again refer to; originally the house was surrounded by a wall and courtyard, part of which with an angle-tower and pointed arched doorway still remains. The most interesting feature in Craigievar is the Great Hall, which still retains its original arrangements undisturbed. It consists of a plain oak dado, with tone frieze and cornice supporting a barrel vault richly panelled in plaster, with carved tone pendants, and having a central groined bay over the fireplace. The dado returns across the hall a few feet from the end walls, forming a vestibule and service-room at the entrance with a musicians' gallery above. A new view of this hall is shown in Billings. What strikes you about this hall is its unity of design, every line tending to emphasize this idea. The ceiling is one mass of rich ornament, which, apart altogether from the beauty of its detail, is in such perfect scale that it never loses its singleness of motive. The frieze line rises round the chimney-vault and end walls, forming a binding line to the whole, and the dado is sufficiently carved in its upper parts so that the ceiling gets a connection to it and grows out of the wall, and again plain in its lower part, so that it in its turn grows out of the floor.

The fireplace breaks up into the vault in an abrupt fashion, and you will observe the artist has been careful to alter the scale of his work here, so that, without attracting the eye harshly, it forms what we call a feature, and combines the opposing scales of the plain dado and frieze and the rich ceiling. The bedrooms are panelled with wood on the walls, and mainly plaster-panelled on the ceilings. Together these rooms show that first of all, and beyond everything else, they are designed and then ornamented, the Designer, whoever he was, shows himself an Artist.

Exteriorly Craigievar consists of a plain square basement of four storeys with rounded corners, the opening of which are comparatively small, with a corbelled out-attic in this case rising to the height of two storeys. Although not better than the most Architecture one sees, it is slightly disappointing, principally because its features are too much emphasized and too easily recognised. The turrets stand out too prominently on the skyline, and rise too abruptly from the angles. The dormers are

too small and crushed-like, and are killed by the coarseness of the tower parapets, while the largeness of their own detail does not tend to minimize this defect.

Looking into the open angle the building seems divided into three separate parts, which the continuous line of corbelling only help to emphasize, and the turrets are so large that the gable is lost.

The builder seems to feel this last somewhat, for on the other side the turrets are run up in the most curious way, and are finished in one case with a half gable and turret, and in the other with one gable over two turrets.

The best view is from the N.E. The Designer here seems more of the dilettant than the Artist, the man who sees keenly but does not understand, and this is borne out by the ugly Renaissance tower ballustrade, which is not native to the building, and might easily have been coarsely copied from a book.

Notwithstanding all its defects, however, Craigievar is a fine, manly structure, and the student will realise on leaving it that although it is neither so grand or so beautiful as Crathes, yet it possesses elements which he has utterly failed to observe in the small-minded work of the present day. The distance from Craigievar to Alford is about four miles, and as you come within a mile of the town the view from the top of the hill is one of the loveliest to be seen. To the left the valley of the Don creeps out from among the hills at the bridge of Alford, and suddenly sweeping round into an expansive plain, nearly circular in form, and about three miles long and three miles broad, gradually gathers itself together again and

is lost among the hills to the right, where the fine peak of Benachie stands out clear against the sky. This bright little oasis, through which the Don slowly finds its course, is covered with the most beautiful woods, with mansions dotted here and there, and in the centre stands the little town of Alford, famous in the district for its markets and its annual cattle show.

(To be continued.)

## W. AUMONIER.

IN our article on Mr. W. Aumonier in last week's issue it was stated that Lady Margaret Hall, Oxford, and the New Baths and Winter Gardens, Harrogate, were by Mr. J. M. Brydon. We learn that Mr. Reginald Blomfield was the Architect of the former, and Messrs. Baggallay and Bristowe were the Architects for the latter.

MR. PASSMORE EDWARDS has offered to contribute £2000 towards the erection of a Victoria Cottage Hospital at Acton in commemoration of the Queen's Diamond Jubilee.

ON Saturday, the 30th ult., Mr. John Barber (Chairman of the Bilton and Starbeck Board School) opened a new school at New Park, Harrogate. The schools have been erected on a site containing 4840 square yards, with a frontage to Ripon Road of 188ft. The building will give accommodation for over 500 scholars, and consists of large central hall, class rooms, infants' room, cookery room, etc. The cost (including master's house) is £6100.

CRAIGIEVAR. SKETCH FROM THE S.W.

# ARCHITECTURAL ASSOCIATION. DISCUSSION ON MR. A. S. FLOWER'S PAPER.

(Continued from page 8).

THE Chairman, in opening the discussion, said he had expressed to one or two of his friends regret that Mr. Flower had not defined his paper a little more fully, believing that it was easier to attract an audience to such a meeting with some definite object or study in view. But he was now quite convinced that Mr. Flower had done the right thing. His paper had been so suggestive, and he almost feared it was of such a nature that it would be difficult to discuss it. The line he had adopted was new, and there was something about it which, to the speaker's mind, carried a conviction of its truthfulness. He had no resources upon which he could turn to show why he thought it was truthful; he was quite unable to prove the suggestion that it was, but it did seem to him to be extremely probable. It seemed that a link was missing, which Mr. Flower had described so daintily and so characteristically, in our history books. They had for some time been accustomed to talk about mediæval Architecture as a sort of

## SANCTIFIED ENGINEERING.

Mr. Flower had certainly carried the question to a very practical point, as his studies had convinced him (the speaker) that the whole of our Art up to the time of the Renaissance was the result of particular study. He expected that an engineer would give them practically the same definition of the motive underlying any modern work of engineering. He proceeded upon geometry, mathematics, and certain scientific factors which he found mainly in his material; but it seemed to him that his method was practically the same. A more interesting prospect was open to them in the prospect of a barren geometrical investigation, which was to them works of sentiment or romance, in the singularly beautiful way in which the æsthetic sense was combined with the engineering geometric sense of the evolution of Architecture. Oh! that they might learn the lesson and be more geometrical, and, oh! that engineers might learn the lesson and be more æsthetic. He had listened carefully to Mr. Flower's opening sentences, and he remarked how gingerly he touched upon Architecturally historical books and their critics; but it certainly seemed he would have to write the new history of English Architecture, for in arriving at the conclusions he had laid before the Association he had already got together—well at all events, sufficient material for an efficient handbook on the proper and efficient study of our

## DEVELOPED ARCHITECTURE.

The portrait of the mediæval Architect which he had discovered and laid before the Association would no doubt make that meeting historical. It might be he thought he was magnifying his office as president of the Association. But such was not the case. They did not lack memories, and this point, owing to the publicity it would receive in the journals, would no doubt claim considerable attention. This thirteenth-century Architect, unearthed in the British Museum, had not a two-foot rule or a five-foot rod or bill of quantities in his hand, but simply a revolving caniper, a pair of compasses fixed in a direction and turned and repeated throughout the building consistently. This was a point which wanted developing; to him it carried an almost indefinable sense of truthfulness and conviction which was very encouraging. Similar testimony to that afforded by this illustration was borne by the celebrated album in the library of Notre Dame at Paris. It had been produced in *fac simile* in a book, the English edition of which was edited by Professor Willis. This book proved that Architects existed as artists and draughtsmen, and as draughtsmen they were geometrical even to the extent of applying it to human figures and to matters which made them titter in their pure innocence. The mediæval Architect was a suggestive Designer, also because he

sketched in a wiser way than the Architects of to-day. We sketched what we saw. The Architect of the thirteenth century sketched as he thought things ought to be, and that was vastly interesting. He made improvements in his design which were suggested to his mind when executing those designs. Another point raised by Mr. Flower's paper was the way in which the Black Death cleared off the tenderness of our national Architecture. When this point was touched upon, it went home to one, for after it they had the deluge, the perpendicular and the no life, no nothing until the Renaissance. He was sure they would all join in their thanks to Mr. Flower. —Mr. Paul Waterhouse proposed the customary vote of thanks. He congratulated both the Association and Mr. Flower on such an excellent paper, and agreed with the Chairman that discussion was difficult, because, he said, it was the paper of a specialist. He supposed Mr. Flower was a man who had given most

## CAREFUL AND STUDIOUS ATTENTION

to Gothic Architecture. Insuggesting increased system in the study of Gothic Architecture he was doing students a great service. They had long been accustomed to complain that the chronological conditions of Gothic Architecture were misleading; in fact, that they hindered as much as they helped. One great difficulty in the study of Gothic Architecture arose in the fact that Gothic Architecture when they first came up to it was chaos, and they could not expect a young person to swim under such conditions. The only way was, as had been said, to divide and rule it. It had unfortunately happened that the first divisions had been made by persons with only a partial view of the subject. These divisions had been taken up and hardened by following antiquarians, but had they been of the best description they could never for a time have thoroughly served their purpose. Even if the

## ANALYSIS AND DISSECTION

of Gothic Architecture was good, it was so complex that these divisions would tend to obscure it. In fact, it would be impossible to divide Gothic Architecture in such a manner that the divisions would not become, after increased study, the cause of obscurity. Persons had imagined that purposes of Gothic Architecture cut the subject up into so many non-interchangeable divisions, which existed as clearly in actual fact as they did in textbooks! No one, therefore, could do a greater service to the student of Gothic Architecture than by pointing out to him a higher standard which would enable him to pursue his studies with clearer views. It had been, and still was, a matter of astonishment to him that they were so afraid to criticise Gothic buildings. He scarcely knew anyone who had the courage of his opinions, and dare tell you that such and such a building, earlier than the fourteenth century, was beastly. Now, it was inevitable that some of the earlier buildings were inexcusable. For his own part he thought many of them were beastly—though, of course, it would not do to say so—and it was highly desirable that they should cultivate the power to criticise buildings, and this led him to another point—the way in which first principles were laid before

## YOUNG ARCHITECTS.

He believed that the process of true growth of an Architect began with the study of anything he could lay his hands upon in the way of Architecture. And, in acquiring the power to criticise, it was important that they should include their own designs in their criticisms. He had one fault to find with the Architect whom they had seen upon the screen, and that was that he had no india-rubber. He would always forgive him the loss of a pencil if he had an india-rubber, for, in his opinion, india-rubber was an important factor in the production of their designs. He was not then prepared to discuss with Mr. Flower the question of whether the geometric principle was the great secret of Gothic design. He was very much inclined to think then—although he did not think so half-an-hour previously—that it was. He was not quite sure whether a sense of equilibrium was a thing

they had to take into consideration in Architecture.—Mr. W. H. Seth Smith seconded the vote of thanks to Mr. Flower. Some of the ideas he had suggested were so fresh—they came as a revelation—that one was hardly prepared to say much on the subject. The paper might be described briefly as a scientific paper. It was scientific in its historical method; it had quite the style of historical criticism which was now in vogue, and it followed a general course of education. They should test everything; everything should be proved as far as possible by such data as Mr. Flower could give them. The illustration he had produced from the British Museum was something new; it marked an epoch, so far as their information on mediæval Architects went, and rather shattered the views they heard so frequently expressed that there was no Architect in the Middle Ages—the idea which, as they all knew, was just now influencing very much the course of instruction in Architecture, and had threatened, and threatened still, to do great harm to young Architects in their training. Of course, they might ride all these hobbies too fast and too far, but he thought that was the tendency now. The idea of the geometric origin of Gothic Architecture was excellent, and brought into prominence a matter which always appeared to have great weight—viz., that they as Architects required very much more training in the direction of engineering science, for they needed not only the artistic power, but also thorough training in those principles which underlie such a structural Art as theirs. He did not know what Mr. Ruskin would say to such a paper as they had listened to, but they could all imagine from his past writings that he would controvert the idea rather energetically. In seconding the vote of thanks he could only hope that that night's paper was only an instalment of other productions by Mr. Flower, which would still further elucidate the subject, and which would lead them into more

## SCIENTIFIC SECTIONS OF STUDY.

—Mr. A. H. Hart said he did not clearly follow Mr. Flower in the meaning of his paper. He had told them that geometry entered very largely into the mediæval designs. But he would like to see the point carried on a little further and see the principles developed. He was looking forward eagerly to the book which had been spoken of, and he presumed he would have to wait to see what Mr. Flower had to say on the subject further. Draughtsmen of the Middle Ages had been referred to, and he might therefore mention that he had had the opportunity of inspecting the original drawing of a Cathedral made on parchment in brown ink. Nothing had been filled in beyond what was absolutely necessary for the guidance of the workmen. Some of the parts were omitted; the absence of the metal work which added so much to the beauty of the building being particularly noticeable.—Mr. Banister F. Fletcher, the Hon. Sec., continued the discussion. He had, he said, been much interested with the paper, but had not yet got to the bottom of it. He thought he had at one time, but further suggestions by Mr. Flower had rather confused him. This suggestion of the geometric idea in connection with Gothic work had already been thrashed out, and any one who wanted to know what had been done on the subject had only to refer to Billings's "Infinity of Geometrical Design," a work which plainly showed the extent to which geometry entered into Gothic structures. Mr. Flower very naturally took objection to Billings's formidable list of dates and so on, but they must remember that they could not very well write a history of Architectural matters without introducing numerous dates, which, although very objectionable, were still asked for by the examiners at the Institute. If Mr. Flower could get dates, &c., eliminated from the syllabus he would no doubt have a considerable following of students who would thank him very much. And, proceeding to deal with Mr. Flower's suggestions, it seemed to the speaker that they must follow the history of Architecture in the Gothic ages as the history of construction if they were going to understand the different forms which were evolved,

and nearly all of which could be traced to constructive principles. Then Mr. Flower had suggested a system which this new history should accept, and there was no doubt he had those thoughts in his mind which, if introduced into this history, would enable them to follow him more closely. He had emphasized the question of design, but it was not so much a question of design as a question of construction that Architectural students ought to follow. Mr. Flower thought that would destroy interest in design. Well, the speaker thought so, too, until last Easter. He was at Canterbury, looking upon the west front of the Cathedral, when a young gentleman, accompanied by a young lady, approached, and, after gazing in rapt admiration at the front for some little time, the young lady remarked: "How like that of the west front of St. Paul's!" So that he did not think the general public understood Architecture, even as Mr. Flower put it, "as a species of superficial adornment." Then Mr. Flower had gone strongly against the division in Gothic Architecture. The speaker quite agreed with him, but what were they to do? They must draw the line somewhere! They could not talk to a student of Gothic Architecture as a general whole. They could tell him, of course, that the sub-divisions were absurd, but they must put the divisions into books, and that was why he objected to Sharpe's division so much. He took one feature—the window—and based the whole of his system on it, whereas, as a matter of fact, the system of window tracery was largely brought about by the system of vaulting. If Sharpe had taken a vault or buttress, he would have been very much nearer the division of Gothic Architecture. Again, Mr. Flower had spoken strongly on the

#### IMPORTATION OF EASTERN GEOMETRY,

but they must not overlook the fact that the Crusaders were intelligent men, who were the engineers of the army. But for a really intelligent study of English Architecture they had got to read very carefully some good English history at the same time, and he would strongly recommend Green's "Short History of the English People," which he had personally found most interesting. He believed that engineering was really a part of Architecture. In the Gothic Ages the men who erected the buildings were practical men; they were not paper draughtsmen, and that appeared to him to be the true secret of all Architecture. The true modern Architect he regarded more or less as an engineer. And as to the triangulation of English Cathedrals, well, Mr. Flower had not proposed to put anything in its place. He went for Geometry pure and simple, and one of the only men to put it down on paper was put out of court. Mr. Flower's objection to text books would, he thought, be overcome by an article written by Viollet-le-duc in the *Dictionnaire Raisonné* on Construction. This was a most admirable scientific discourse on the development of Gothic Architecture, and as far as he could remember there was no division. It was an article which every Architect ought to read. And in closing one could not help thinking that Gothic was the best style of Architecture for the student to study, whether he was going to design in Gothic or not. It was a study in construction. To anyone who measured up Gothic structures, and reasoned it out as he put it down on paper, it was an Architectural education in itself, and although he might not agree with the principles of the style, yet he was sure to derive great benefit.—The vote of thanks was carried with acclamation, and in returning thanks Mr. Flower answered the criticism at some length. As to Mr. Seth Smith's suggestion that further instalments on the same subject should be given to the Association, it was a difficult question as to how far vague ideas in one's mind could be made to assume definite form. He would not like to say for one moment that Geometry was a Royal road to design, and he did not suppose either that any of the mediæval Architects were originally inspired by it—the Englishman, at all events; the Frenchman was more logical. The Englishman did not attempt to carry anything out to a logical conclusion. If they could get the feeling of the

old Architects into their heads, they could tell, despite all text books, who the men were if they had only a bit of a moulding or any part of a building. It was not a matter of any hard and fast rule; it was a subtle influence which they could only feel. But, of course, they could not expect him to bring drawings of every building in England and point out where he thought he could detect this influence. But he could assure anyone who cared to try it that it would be a new amusement, when going about looking at old buildings, to try and find this geometrical influence. He agreed with Mr. Fletcher in his comments as to divisions. But this was a thing they could not illustrate without pulling up some of these text-books which told them that the flowing line began after the middle of the fourteenth century, where, as they knew, that all the men who did it were killed off by them. As to the Crusaders, well, when a captain who had seen every part of the world settled down in his country parish he did not want to knock down the Church and build it like a Hindoo temple, or build his house like an Afghan fort. The Crusaders certainly had a good deal to do with the matter, but he did not think their crusades were all-important. Mr. Green went on to speak of the depopulation, particularly in large centres, brought about by plague, in the Middle Ages, mentioning that the only building carried on for some years afterwards was at Windsor. He admired a good deal of Mr. Pellan's triangulation of Cathedrals, but setting-out did not cover the whole question. Divisions, as Mr. Fletcher said, must be, and the question therefore was how they would make them, whether according to facts or according to the Antiquarians of the last half century. Mr. Flower concluded by joining Mr. Fletcher in commending Viollet-le-duc's article on Construction.

Numerous illustrations of Mediæval Architecture were thrown upon the screen.

#### SALISBURY CATHEDRAL.

If the "restoration" of Peterborough Cathedral had not become a matter of public controversy, the work now being done on the famous tower and spire of Salisbury Cathedral would have attracted more attention than it has done. It is undoubtedly of considerable importance. If the Dean and his advisers are to be trusted, the result will be to preserve for many ages the beautiful spire that is the chief glory of this noble church, but has always been a source of anxiety to its guardians.

The peculiar merit of Salisbury Cathedral is its unity of design. It was built upon a new site according to a definite plan, and was practically finished within forty years of the day when the first stone was laid. Various additions were afterwards made, but these were all swept away a century ago by the remorseless Wyatt, the father of the modern "restorer," so that the Cathedral as it stands to-day is precisely the same, in all essentials, as when it left the builder's hands. Just as St. Paul's was the creation of the great Wren, so Salisbury Cathedral, as we know it, was conceived by the master-mind of one great thirteenth-century Architect, who may be identified, perhaps, with Elias of Dereham. The history of the edifice is well known. When Old Sarum was deserted by its bishops in the early part of the thirteenth century, Bishop Richard Poore sought and found a site for his new cathedral on the banks of the Avon. Here, at a spot called Maerfield, where three hundreds meet, the Bishop laid the foundation-stone on the 28th April, 1220. The building progressed so rapidly that in 1225 the Bishop was able to celebrate divine service in the east end, while in 1226 William Longespée, Earl of Salisbury, was buried in the church. Robert Bingham, William of York, and Giles of Bridport, who succeeded in turn to the See, pushed on the work with untiring energy, and in 1258 Bishop Giles was able to invite Archbishop Boniface to consecrate the Cathedral, attracting vast crowds of spectators by the promise of indulgences of a year and forty days to all who were present during the octave of the dedication. However, the workmen did not actually

leave the building till 1266. The spire was an afterthought.

#### THE ORIGINAL ARCHITECT

no doubt contemplated the possibility of erecting a lofty central tower, but he seems to have abandoned the idea for fear lest the substruction might prove too weak. The fall of the Winchester spire in 1107 may well have deterred him from making the attempt. However, after his time a more daring genius completed his plan, in or about the year 1300. The result has fully justified his boldness. The incomparably graceful spire, rising to the height of 404ft., is one of the wonders of the world. The Strasburg spire, which is 488ft. high, and the spire at Amiens, which is 422ft. high, are taller but less beautiful and less effective than this triumph of English Gothic Architecture. Besides, although it was built on very insecure foundations, and although it has certainly proved too heavy for the pillars on which it rests, the spire still stands, and is likely to stand for many generations yet. At various times the spire has given the dean and chapter much cause for anxiety. In the reign of Charles II. Wren was once summoned to report upon it. He was so impressed with the audacity of the builder that he could not believe that the original Architect intended to have any spire at all. But it did not fall, as the dean of those days seems to have expected.

#### TWO CENTURIES LATER

Sir Gilbert Scott began to strengthen the spire with iron ties invented by Mr. Shields, the engineer, and to secure the foundations of the tower. The work began by him in the sixties is now being brought to a conclusion. Unhappily, it has been thought necessary to replace many of the old stones, but in other respects the proceedings of the Architect in charge, Sir Arthur Blomfield, seem to have been less open to criticism than the rough treatment accorded by Mr. Pearson to the unhappy west front of Peterborough Cathedral. It may be hoped that the work will be successfully completed, for the Cathedral which even Pepys admired and that Constable loved is one of our most sacred and beautiful possessions.

The third section of the restoration of St. Mary's Church, Chesham, viz., the re-building and extension of the chancel, has just been accomplished. The new east window (presented by Baron de Ferriers in memory of his father, who for twenty years resided in the parish) was unveiled a few days ago.

A USEFUL map of London, showing the schemes now before Parliament for metropolitan improvements, and also indicating the extensions, &c., for which the various railway and tramway companies are seeking powers, has been issued by Mr. Edward Stanford, 26 and 27, Cockspur-street. In all, the schemes are twenty-four in number.

The Great Western terminus at Paddington is undergoing alterations necessitated by the increase of traffic resulting from the augmented service to the West of England. There will be an additional platform to the six already existing when the new arrangements are completed. The new platform will occupy a portion of the broad space between Nos. 4 and 5.

The proposal to extend the Bradford Town Hall on land at the rear in Nelson Street and Chapel Lane, owned by the Corporation, was discussed by a special sub-committee of the Town Council last week. The proposal is to erect a new Art gallery and extra municipal offices on the site, connecting them with the Town Hall by means of a bridge. The committee decided to prepare plans to be submitted to the Finance Committee of the Corporation.

An unusual occurrence recently happened at Stoke Newington. More than a year ago a builder put up a house at a less depth than is required by the Metropolitan Building Act. Proceedings were taken by the London County Council against the builder and the owner, and an order was made that the building should be set back. This order was not obeyed; and the London Council workmen have now started the work of demolition.

## THE GARDEN IN RELATION TO THE HOUSE.\*

By H. E. MILNER ASSOC. M. INST. C.E.

MR. H. E. MILNER said that he proposed to speak of the treatment adopted in laying out grounds, in their more immediate relation to the house, and to indicate generally a practical application of the theories advanced. The formal treatment of gardens reached a high state of perfection under Elizabeth, when the Architect who designed the house also laid out the garden, with its forecourt and broad terrace, its straight walks leading from it encompassing the flower beds, and all harmonising with the building. Little thought, however, was devoted to the treatment of the country outside beyond the planting of avenues. Towards the end of the eighteenth century, fashion ruled the destruction of most of the old formal gardens, to be replaced in very many instances by a no less artificial and formal imitation of nature. The designers were not content with amalgamating with whatever was good of the old work a natural treatment of the outlying ground, or of giving greater breadth to the existing formal work, but swept away all this and replaced it by meaningless walks, by clumps of trees and shrubs dotted irregularly on the lawn and park, by a boundary of planting, by imitation of bits of natural scenery, by the introduction of artificial ruins and such-like objects, with the desire of making a picturesque landscape. The author differentiated greatly between the treatment of terraces, walls, steps, balustrades, &c., in stone and verdure. Architects should extend their work in the garden in connection with the building; but this work should go hand-in-hand with the composition of the greater picture, which the art of landscape-gardening should produce. The increased

### RESOURCES OF MODERN HORTICULTURE

should be taken into account: not merely the eye but the mind should be appealed to by the beauty of composition of line, colour, perspective, and grandeur; a liberal Art should not degenerate into a mechanical one. Places differed in the conformation of the ground, in climate, in soil, in the requirements of the owner, in the amount to be expended, and in the possibility of an extension beyond the immediate precincts. It was therefore futile to lay down any hard-and-fast rules for design. The author then proceeded to treat in detail of the site, the approach, the terrace, and the garden formation and planting. The approach to a house should always appear to be direct, and any deviation from such directness should not only arise from, but should also be made to arise from, some decided obstacle. By direct was not meant straight. A straight approach required careful treatment. It was artificial in character, it could appropriately be used when an imposing or somewhat pretentious building was at the end of it, or when the distance was short, and when the country was flat. In sloping ground it should, if possible, be made against the slope of a hill. The gradient should be even and flat, or very slightly and continuously curved, otherwise it would appear not straight. If the ground be very undulating, a straight road is out of character with its surroundings. A curved line of road was generally to be preferred, as being more easy of construction, more varied views could be obtained, its gradient could be varied, following within limitations the

### NATURAL UNDULATION OF THE GROUND,

and the side slopes could be more easily and freely dealt with than the sides of a straight drive. Gradients, width of walks and drives, entrances, were here discussed in considerable detail by the author. The lodge and entrance gates belong to the drive, and should be parallel with, and at right angles to it, as distinguished from the highway. The face line of lodge should be at least ten feet from the edge of the drive, and its windows should be able to command the entrance and a

certain length of drive. On entering by the drive it was advisable to create a good impression, and therefore to mark distinctly the difference between the dusty highway and the shaded, well-trimmed drive within the gates. Planting might be introduced on either side of the entrance, but once well inside a view should be given of the outlying grounds, or stretch of park, or distant wood. A curved drive should not be planted continuously, but broad masses of planting introduced, at first to shut off the highway, at turns in the drive, and on the top or slopes of knolls round which the drive may wind. The direction and level of the approach, and the character of the Architectural features, ruled greatly the plan to be adopted for the treatment next the house. The treatment of the terrace also depended very much on the Architectural character of the building. By "terrace" was meant not only the narrow strip of level ground placed parallel with the house, or the more stately portion—often with Architectural adornments—laid out along the face of the structure, but the whole of the ground that formed the base or setting of the building. Having next discussed the various forms of terraces, the author passed on to the treatment of the garden proper, quoting partly from his book on the subject, which defined the system he advocated. So many considerations press in to vary design in

### THE GENERAL PLAN OF A GARDEN,

that arbitrary dealing by imposition of what may be termed paper designs, however ingenious, was ill-advised. The detailed plan should spring from the site as an adaptation of its natural, or created natural, features, and should not be forced upon the position, crushing it to an artificial scheme. To copy simply the design of another place is inadmissible. Considerations that rule in this connection were almost infinite—extent, geological formation, soil, existing natural formation or features, climate and aspect, the display of distant beauty, conformity to outside influences, particularly to the requirements of the possessor, and the expenditure of money that may be made. There were points of similitude between the painter's Art and landscape-gardening; but the landscape-gardener must consider that his colours change and grow; he must realise as he creates his picture that in a few years what now seems like a light green stroke of pigment to the painter may have become a tall tree, beautiful in itself, but of altered beauty, either helping or marring the landscape. He must follow nature by adapting or garnering her beauties, and tutoring her, so to speak, to a display of them. But by following nature was not meant a slavish imitation or reproduction of any of her particular scenes. Some were unattractive, some very inappropriate—all were subject to dissimilar conditions, and imitation in nature as well as in Art produced pettiness. But the spirit of the beauty of nature, embodied as it were in those of her works or features that express her majesty, simplicity, peacefulness, sweetness, repose, refinement, strength, and variety in form, colour, abundance, or any of her modifications as parts of loveliness, should be included and brought into juxtaposition in an ideal scene so far as it was possible to promote its natural development. The terrace, the region immediately next the house, and the general arrangement of the walks and gardens having been discussed, the author next dealt with the most suitable positions for planting trees and shrubs, principles of grouping, the effect of colour on distance, character of foliage, &c. He maintained that they should carry out in the parts surrounding the house the Architectural feeling of the design in terraces, walls, steps, basins, beds, and so form a base; that they could still have the dignified and quiet delight of formal work—not a narrow curtailment of the whole design. This Art gardening was far beyond the limitations of formal work only, for it could apply the balance and proportion of the latter, and, in addition, present a noble conception of Art-work, and draw into his picture the greater, broader, varied landscape.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

February 17th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

EIGHT sets of plans were sent in last December for a large new asylum for Belfast, but the Governors have adjourned the matter until the 22nd inst. A letter, dated Feb. 3rd, from the Board of Control with reference to the competition of plans for the new asylum, was recently placed before the Governors. The Board of Control stated that after receiving the assessor's report they found it necessary to get the estimates prepared for two of the designs which they had selected. These estimates will be supplied on Monday next, and the matter will be considered by the Board at their meeting the following day, and should no further cause for delay arise the plans and documents in connection with the competition will be forwarded for the information of the Governors on the following day.—Mr. Lawther asked would all plans sent in for competition, including those selected by the Board of Control, be sent, or only the two selected.—Dr. Merrick intimated that he understood Dr. O'Farrell had said that the Board would have every single plan sent in.—Sir William McCammond said that the Board of Control had no power to select plans.—Dr. Merrick did not know what the powers of the Board were, but he said that any recommendation from the governors would be attended to.—Sir William McCammond expressed the opinion that the governors should have some control over the estimates.—Mr. Lawther, J.P., said that, according to the letter, their hands were perfectly tied to the two plans, and the estimates of the two plans. He did not think that that should be so, and moved that the Board of Control be requested to send down with their recommendations all the plans. He had no doubt the recommendations would receive every attention at the hands of the governors.

ALTHOUGH passengers in the streets of London see little trace on the surface of excavations going on far beneath them, the fact remains that the metropolis is now either pierced, or is being pierced, in all directions with subterranean communications which will soon be open for the transport of the public from the City to the suburbs and vice versa. Some interesting particulars were given by Mr. Wyndham Portal recently to the shareholders of the Waterloo and City Railway regarding the new tunnel under the Thames which will connect the South-Western system with the centre of the City. The work was commenced in June, 1894, and has gone on uninterruptedly ever since. And, what is really an astonishing fact, there has not been a single accident notwithstanding the difficulties of the work which had to be done. One tunnel is now completed, and the other will be finished by the end of this month. The subway had to be carried right underneath the foundations of Waterloo Station. In the City underground work is also progressing as speedily as possible, and nearing completion. Mr. Portal paid genuine tribute to the skill of Mr. Greathead, the engineer, whose loss they all greatly deplored.

\* A paper read at the Institute on Monday night. The discussion is held over until next issue.

THERE has just appeared what may be described as a thoroughly competent, as well as comprehensive, manual on "Pottery; Ancient, Mediæval, and Modern." It is true that there is no lack of literature on the subject, but the charm of this volume consists in the fact that it deals with the craftsman himself, quite as much as with the plastic material with which he works. There is truth in the assertion that the Art of the potter is essentially human, since no other material records as faithfully as burnt clay the minutest touch and individual feeling, and even caprice of the man who gave it form and impressed it with his own ideas of beauty. Potters, ancient and modern, seem always to have taken a keen interest in their work, and to have been jealous of their own claims in regard to it. There are Greek cups in existence which were fashioned when the world was young, with scrawls across the base of them which record the name of the man who designed them, and in some cases even the name of his assistant. Little, stealthy marks and modest monograms lurk in ambush in much fine modern work of the same description, and those who know how to read contemporary hieroglyphics of the kind are able at a glance to state what workmen were responsible for the graceful result. The greatest English potter was probably Josiah Wedgwood, and he was somewhat of a stern taskmaster, who repressed the individuality of the men who worked under him, and yet though they knew—to borrow a homely phrase—that it was as much as their place was worth to leave their own personal token on the splendid vases which their master produced, they sometimes contrived with sly ingenuity to entangle in the design a mark which experts can still identify.

It is suggested that, as in the ceremonial of the commemoration of the sixtieth year of the Queen's reign one main incident will be a long procession through the streets of London, every householder or occupier of business premises along the line of the procession should clean the exterior of his house; in the case of stone houses, scrape down the exterior; in the case of brick, clean and repaint; in the case of plaster, repaint. The dirtiest capital of Europe, with its smoke-poisoned atmosphere, London is probably the only European capital where all buildings, public and private, are not subjected to periodical scraping and cleaning. In Paris, on all great occasions, "La Toilette de Paris" is a recognised item in the programme.

ARRANGEMENTS are contemplated for providing a system of artificial lighting in the National Gallery and the National Portrait Gallery. If proper precautions are taken against fire such a provision would be an un-mixed advantage. On foggy days, and after an early hour on winter afternoons, study in either building is quite impracticable; and many opportunities of examining the pictures are lost to workers, whose daily occupation prevents frequent visits to Trafalgar Square. The installation of the electric light would go a long way towards counteracting the inconveniences of our variable climate. It would be as well to consider whether some way could not be found of lighting the galleries from outside. Both as a means of reducing the danger of fire, and for the sake of securing as nearly as possible the same incidence of light upon the pictures as is given during the daytime by the existing skylights, such a device would have much to recommend it.

THE representatives of the National Association of the Master Builders of Great Britain, who have been holding their 38th half-yearly meeting at Blackburn, are apparently experiencing troubles common to most other occupations. The troubles with which they are assailed were stated by Mr. T. F. Rider, who presided, to be due partly to what he termed "cutting each other's throats," and partly also to the desire on the part of the British workman to get the largest wages he could for the smallest amount of work. The only remedy he could suggest for the

latter was that of reverting to the old system of payment by piece. "In the occupation with which I am associated, piecework has always been the rule, and is ever preferred by the operatives, and I have never yet been able to understand why the building trades should have such a strong aversion to it. Apart from that, however, the complaint of the Chairman about the British workman getting as much money as he can for as little work as his employer will accept, is quite in consonance with the principles upon which the employers themselves act. I have never yet heard tell of a master builder taking less for a job than he could get, or of one who supplied more timber or more bricks than he contracted to give for a certain price. Under such circumstances these sneers at the British workman's fondness for high wages are altogether out of place, and make the men who utter them appear as if they had yet to learn the elementary principles of economic science."

It has just transpired that the President of the Royal Academy was on the verge of having his two contributions to the Exhibition of the Royal Glasgow Institute of the Fine Arts (which opened on Monday week) rejected by the unconscious Hanging Committee. It was discovered when a photographer arrived at the Galleries to photograph Sir E. J. Poynter's pictures. The photographer hunted all over the rooms, but could not find the works in question. Then he appealed to the authorities. They at first could give him no information, but the result of an energetic search was that the President's pictures were discovered among the great Rejected. The fatal chalk-marks were on the pictures, but both have since been hung. It should interest the Academy to hear how near it was to a snubbing from the Glasgow School.

APROPOS of the vote for public works and buildings, says the *Chronicle*, proposals for parks and pleasure grounds include the sum of £500 for doubling the Bushey Park entrances at Hampton Court and Teddington, £500 improvements in Greenwich Park, £1000 on the erection of a north wing of the temperate house at Kew Gardens (the total estimate for this purpose being £7600), and £400 on a new greenhouse; £550 on a new hothouse at Regent's Park, £500 on further improvements in lighting the footpaths in Hyde Park. At the Houses of Parliament £2350 is to be spent in new works, among the items being £750 for the completion of the decorations of the panels in the central lobby. The warming, ventilating, lighting, and drainage expenses of the two Houses for the ensuing year are estimated to cost £15,800. The total sum to be expended in 1897-98 on the Admiralty extension buildings is £40,000. The revised estimate for these buildings is £340,000, exclusive of furniture, and up to Nov. 30, 1896, £183,247 of this had been disbursed.

THE Galician Diet has passed a resolution for the restoration of the Royal Castle on the Wawel, the idea being to make it a Royal residence. The castle, which is now used as a barrack, has interesting associations. Up to 1610 it was inhabited by Polish Kings, the Polish national saint, Stanislaus, being buried in the Cathedral inclosed within its walls. The Emperor visited the castle in 1889, and then expressed a wish for its restoration. The expense stood in the way, but that difficulty has been overcome, and there is reasonable prospect of the castle becoming the residence of the Austrian Emperor, who will no doubt appreciate the Diet's gift.

A CORRESPONDENT throws out to the City authorities the suggestion that they shall help to beautify London by removing the unsightly buildings which obscure the Guildhall on its south-west side, preventing its full beauty from being seen. The houses which obscure it are absolutely commonplace and occupied by offices, for which some neighbouring quarters would do equally well.

A GREAT deal of local interest has been excited at Wexford by the discovery of a large

number of skeletons and human remains at a place known as the Old Pound. For some time past the Corporation had in contemplation the levelling of a large mound of earth at that part of the town, as it was a great obstacle to traffic, and caused much inconvenience to pedestrians. The workmen had no sooner begun to remove the earth than they discovered numerous skeletons and human bones, some old coins and old pipes. The foundation-stones of an old Church were also discovered, and pieces of a stone holy-water font, which was evidently of exquisite workmanship from the elaborate carving to be found on the broken parts. Some very old coins were also discovered. In the sanctuary of the Church, as outlined by the foundation, a skeleton was found, supposed to be that of a priest. A vault was unearthed in which three skeletons (one of them in a very perfect condition) were found, and two very peculiar coffins were discovered. They are very similar to the old stone coffins to be found in many of the Norman Churches throughout Ireland. A Church formerly stood on the site, and was known as St. Peter's. It stood outside the town wall, but according to Sir William Petty's survey, made in 1670, it was then in ruins.

WHAT is occurring or what will occur to the metallic portions of the many tall buildings that are in process of erection at the present time, under great dissimilarity as regards temperature, humidity, and other climatic conditions, but of one characteristic sameness, viz., being sealed in solid masonry or other coverings beyond the ken of inspection? Probably no engineering question to-day is entitled to more serious consideration than this one. In discussing it recently before the American Society of Mechanical Engineers, Mr. M. P. Wood maintained that while inspection of some of the buildings now in progress, as well as some of those lately erected, reveals possibly a slight improvement in the means of preservation adopted over those apparent a short time ago, yet the improvement is a hollow mockery, and will bear fruit for repentance before many years have passed. These structures, though more carefully painted than those erected before, with more and heavier coatings of some kind of stuff called paint, do not appear in a single case to have received any attention or consideration as to the condition of the metallic surfaces, before applying the protective coating beyond a possible sweep with a dirty broom to get rid of the rough dirt from the workshop yard, and a possible wipe with a piece of old sacking to remove the grease due to machinery processes. There has been nothing like a washing-down of the parts with soda-ash or lye-water to remove the grease, and then pickling with weak acid to remove the mill scale, and a subsequent washing with lime-water to neutralise the acid bath, warming the work before painting it, and taking care to apply the paint only on clear, bright days, when no sweating can occur, or applying the paint in warm paint rooms. It is safe to say that not in a single case out of the many skeleton structures of modern sky-scrapers can this be found to have been the procedure. There would seem to be no better possible assurance than all this of trouble ahead for coming generations.

WRITING on the subject of waterfall and electric-lighting, a correspondent in a Liverpool contemporary says: "In recent years, side by side with electric light and power, the phonograph, the telephone, and photography, improvements have been made in the turbine, a machine as far superior to the water-wheel as electric light is to a tallow-candle. The turbine, as now designed, takes the utmost power out of a waterfall, whether that fall be only eight or nine feet or 200 feet in height. The Americans and the Swiss are fully alive to the force attainable from waterfalls, and towns and villages are lit up in both the United States and Switzerland by these means. The villagers at Acton Bridge and Weaverham, wishing to keep pace with the times, recently approached the trustees of the Weaverham Navigation for permission to

utilise at these falls (the falls of the river Weaver situated within a few miles of Liverpool) this waste-power of the river, by putting down a turbine, and connecting the same with a dynamo to supply electricity for their houses, farms, churches and chapels. Such a request made to municipal authorities in Switzerland, or the United States, would have met with a ready acquiescence, but in this case has been met with a refusal. The navigation would not have been injured, because all the parish council of Acton Bridge asked permission for and wished to do was to utilise the vertical fall of the river (a height of 8ft. 6in.) which no ship could sail up, and which, at present, is being wasted.

MR. E. G. KIBBLEWHITE, writing on the subject of electric lighting in London, says: "It is a disgrace to the local authorities charged with the administration of the long line of thoroughfare embracing the Strand and Fleet Street that we should be asked to pay a private monopoly 6d. per unit when Brighton gets its electric light for 2½d. Not only is the Charing Cross and Strand Electricity Supply Corporation demanding more than twice the price that Brighton pays, but it saddles acceptance with a two years' agreement, and its general conditions are irritatingly onerous. Nor is this all. If the local authorities served us we should not have our roadways broken up, communication with our premises interrupted, gas and water communications broken, and the general annoyance and loss inflicted on us which we have endured here in the Strand since August last.

To those who desire to understand the *raison d'être* of Thames floods—and the social economics of their mitigation—the present aspect of the Thames valley is instructive. Much has been said and written by interested and afflicted parties as to the causes of these inconveniences; and in most cases such sufferers have not been slow to lay the blame upon the Thames Conservancy, by the allegation that if there were more weir accommodation there would be no such serious inundations as those of November, 1894. These grumblers allege that weirs should be more capacious, and be more freely opened in advance of floods, so as to clear the channel before the great pressure arrives. This last contention is sound enough; but it is precisely what the Conservancy have been doing. There is an old-standing difficulty as regards mill-owners, who claim a prescriptive right to the maintenance of a "good head" of water; and the maintenance of this "head," if strictly carried out to the last hour before flood arrives, will mean a congested instead of a free channel when the pressure begins. But the bulk of millers now realise that what they may gain by use of the full head for a few hours before a flood may be more than lost by cessation of power for "undershot" wheels when, later on, flood rises too high for such wheels to run (as is the case with many mills recently). We may look on the mill difficulty as one which can be, and is, now practically overcome under Conservancy arrangements.

EVERYBODY is suggesting "memorials" for the Queen's Commemoration. Lord Playfair proposes one. Let us, he says, in this auspicious year, make one mighty effort to finish the South Kensington Museum. Let us house the collection in something better than a number of sheds which would disgrace a fourth-class country railway station. Let us erect a noble building, and call the whole the "Victorian Museum." We would add, says the *St. James's Gazette*, the suggestion that somewhere on the site of the present sheds might be placed a memorial tablet inscribed as follows:—"To the memory of the Brompton Boilers, which, after remaining a monument of official ineptitude and national tolerance for over thirty years, were finally swept away in a spasm of indignant common-sense to commemorate the sixtieth year of the reign of Queen Victoria."

In the Queen's Hall of the People's Palace, Mile End Road, Mr. J. Wolfe Barry recently

distributed the certificates in engineering and general subjects to students of the East London Technical College. The report showed that the students in the engineering classes during the past session numbered 756. The entries in all the evening classes of the college had been 6387, and the college had gained twenty-two London County Council exhibitions, fourteen of which were for engineering. Mr. Wolfe Barry delivered an address, in which he said he was not one of those who believed that England would necessarily be worsted by foreign competition in their engineering productions. But no doubt they would have to fight hard to maintain their position. The technical school at Berlin, apart from its equipment, cost £450,000, and other nations were equally forward in the work of technical education. In this country the best of theory and of practice should be enlisted; they should have no half measures; and the nation which would win in the end would be that which was best instructed.

At the annual meeting of the members of the Derbyshire Archaeological and Natural History Society, held on Monday week at the School of Art, Derby, the hon. secretary, in the course of his annual report, stated that it was intended to hold a general meeting of the society after Easter, when Mr. St. John Hope had promised an address upon "Derby as it was." The report went on to state that the restoration of the old font at Wirksworth had now been most successfully carried out, and the font was again in use. There had been a rumour of a scheme for restoring to use another old font in the county, and it was to be hoped that this rumour was correct. The council had been consulted as to the best means of preserving from further demolition the old cross at Pleasley, and this matter was now under consideration. The council was glad to be able to report no act of special vandalism in the county, and whilst hoping that this really meant that nothing of the kind had been perpetrated, they would still strongly urge upon individual members the importance of keeping careful watch in their own neighbourhoods with a view to the possible suggestion of counsels wiser than those which sometimes prevailed.—The report was unanimously adopted.

IN St. John's Cathedral at Malta the tapestries are some of the finest in the world, and perhaps the most interesting thing that Malta can show. No one can fail to notice (says the *Times of India*) the number of tropical animals that figure in them, such as the elephant, the tapir, and the ostrich, and in connection with this it might strike even the most casual sightseer that the human figures are all dark, some with a distinctly negro, others with a Red Indian, type of countenance. But it requires a closer examination to discover that each tapestry is evidently intended to depict the inhabitants and animal and vegetable products of some distant part of those new regions of the world, the discovery and conquest of which were exciting the minds of all Europe three centuries ago. In one we see a black prince, under a gorgeous umbrella, being carried by two stout men in a sort of hammock slung on a pole. This is the "munchil" in which the wealthy natives of Canara and Malabar travel to this day. Over this group rise two palm trees, one a cocoanut, the other a brab or talibot. In the cocoanut tree there sits a langoor, or blackfaced monkey, most faithfully executed, and on another branch the little owl which is such a distinctive feature of Indian bird life. In the foreground crawls a fine specimen of the common land tortoise, recognisable at once by the peculiar markings of its shell, while in the water close by we see the swordfish, one of the most striking of the monsters of the deep on our west coast. In another tapestry the principal figure is an elephant. In the background is a tree laden with fruit, which no one who has ever seen the original can mistake. It is the cashew-nut. This tree is a native of South America, and was introduced into India by the Portuguese. The elephant, shows, however,

that the tapestry represents India, not America, and the rest of the picture bears this out. There are South American tapestries, too. In one of them, about which a beautifully-executed toucan (not the Indian hornbill, which is often miscalled a toucan) leaves us in no doubt, two savages are represented hunting with bows and arrows, and the arrows are longer than the savages.

THE Whitechapel Board of Guardians, at its last meeting, further considered proposals for housing the children. In the first place, the dissolution of the Forest Gate District School came up, and it was decided that the present schools, which are situated at Forest Gate on a site of twelve acres in extent, shall be offered to the Poplar Guardians on the following terms, i.e., the price to be paid to be fixed by valuers mutually appointed, who shall determine the present market value of the ground as a vacant site for a parochial school. As, however, portions of the buildings require alterations to bring them up to modern requirements, a deduction of one-third is to be made from the valuers' estimate, in order to arrive at their sale value. The Guardians next dealt with the arrangements to be made for the accommodation of the Whitechapel children who are to be brought from Forest Gate, and the scheme to erect country cottages for their reception was adopted.

AFTER all, the Metropolitan Water Question is likely to be dealt with during the current session of Parliament. It is understood that the Government has decided to support the second reading of the County Council Bills, which is an important step, as it commits it to the principle of purchase and sets aside Sir John Lubbock's scheme of control. The further intentions of the Government will be explained in due course; but it is to be presumed that the Bills will go to a select Committee in the usual manner with the object of modifying them in accordance with the views of the Government on the subject—especially with respect to the terms of purchase and the composition of the body by whom the companies' undertakings are to be taken over.

To the London or North-country traveller, accustomed to solid stone viaducts and iron or steel bridges, the spider-like wooden viaducts of the trunk railway in Cornwall are a never-ending source of wonder. They have stood stress and storm for many a long year, and are apparently almost as sound now as the day on which they were first constructed. But they were built in an age when the mineral and passenger traffic were in their infancy, and when a single line worked by the staff system was sufficient to bear all the demands made upon it. Season by season the army of invading tourists in one of the most charming of western counties has increased, and the doubling of the metals has become a matter of prime necessity, which the managers of the railway have not been slow to recognise. The artistic wood structures are giving place to those built of stone, and the glories of Menheniot, Ponsanooth, and Treliever, as our forefathers once knew them, will, with a future generation, become but a memory.

OLD Bow Street Police Station is being demolished fast. Its grim old porticos and dust-covered windows still present a stern front to the modern and sprightly-looking Floral Hall on the other side of the road, but it is being attacked in the rear by demolishers, and stone by stone the front is being reached, and will meet the same fate as the building at the rear. A large warehouse will be erected on its site, which belongs to the Duke of Bedford.

THE Central Society of Belgian Architecture announces that an international congress of Architects will be held, under Government auspices, during the Currency Exhibition, to celebrate the twenty-fifth anniversary of the society's foundation. It is anticipated that the leading countries of Europe, as well as the United States, will send delegates.

## Professional Items.

**ABERDEEN.**—The Syndicate which is promoting the erection of a new theatre in Aberdeen have selected Mr. Verity, London, as consulting Architect of the building. A site for the theatre has been secured on the Rosemount Viaduct, in the north-western district of the city.

**BLAIRGOWRIE.**—Ardblair Castle, Blairgowrie, which is of more historic interest than any other in the district, has only recently had extensive improvements effected upon it in a manner in keeping with its ancient character, and from plans by Mr. Sidney Mitchell, Architect, Edinburgh, who was the designer, amongst other things, of "Old Edinburgh" in the first Edinburgh Exhibition. Long before Ardblair came into the possession of the Oliphants of Gask, to a branch of which family it belongs at the present time, it was the seat of the Blairs, a branch of the Blairs of Balthayock, the first of whom was contemporary with David II. (1329–1371). It is not without interest to note also that Nigel Oliphant, who figures in Scott's "Fortunes of Nigel," was of the family connected with Ardblair. The extensions, which consist chiefly of a large entrance hall and a number of new rooms, were begun over a year ago, the contractors for which were: Mason, Charles Farquharson, Clayquhat; joiner, T. Doig, Rattray; slater, A. Duncan, Rattray; plumber, R. Kidd; plasterer, J. Bell; painter, P. K. Donald—all of Blairgowrie. Commodious stables have also been erected, the contractors of which were: Mason, Bailie Hill; joiner, T. Steven; cement work, J. Bell; slater, W. Craigie; plumber, R. Kidd; and painter, P. K. Donald—all of Blairgowrie. Mr. G. Cunnison was Clerk of Works.

**BOLSOVER.**—The committee of the building fund has received the sum of £4553 towards the cost of erecting the new Church at Bolsover. The Architect, Mr. Ambler, of London, has inspected the ruins for the purpose of ascertaining whether the outside walls and tower are safe, and his report is expected in a few days. He has also been instructed to prepare plans for all the work required to be done. The committee is hopeful of obtaining the Duke of Portland's consent to extend the wall on the south side so as to provide greater seating accommodation, and to bring the Memorial Chapel inside the Church.

**CONISBRO.**—Detailed estimates have been prepared of the cost of constructing the proposed railway from a junction with the Manchester, Sheffield, and Lincolnshire Railway in Handsworth, passing from thence through Treeton to a junction with the South Yorkshire Railway of the Manchester, Sheffield, and Lincolnshire Railway at Conisbro'. The estimated cost of this line is no less than £400,000, of which cuttings and embankments will absorb £118,120; viaducts, £13,600; tunnels, £20,700; stations, £25,000; and land purchases, £28,850. The railway will be constructed as a double line throughout its whole length. The engineer to the scheme is Mr. W. B. Myers, Beswick.

**DUNDALK, IRELAND.**—It will interest many to learn that the Church of St. Brigid, begun last winter, is now well in hand, and is rising all round to a height of five or six feet above ground. The style is Romanesque, with rounded arches, doors, and windows, and the Church will consist of nave and transepts, with a circular apse to receive the altar. The total length inside is 110ft., 70ft. across the transepts, and width of nave 30ft. Outside the stone will show all rockfaced granite, with limestone dressings, rounded doors and windows, and in the angle of the east transept and nave will rise a Romanesque tower, when we are able to build it. The contract is £5700, and £700 more if we could go on with the tower. Altogether the design shows a very beautiful little Church. Mr. Byrne, of Suffolk Street, is the Architect, and Mr. M'Adorey, Dundalk, the builder.

**EBBW VALE, MON.**—Mr. J. H. Phillips, St. John's Chambers, Cardiff, and Mr. Frank Baldwin, Brecon, have been appointed joint Architects for the erection of an Intermediate School for the Ebbw Vale and Brynmawr districts.

**HACKNEY, N.**—On Sunday last the foundation stone of the South Hackney Synagogue and class rooms about to be erected in Devonshire Road, Mare Street, Hackney, was laid by the Hon. W. Rothschild. The new buildings, of which Mr. Delissa Joseph is the architect, and Messrs. Brown, Son, and Bloomfield are the builders, will occupy a frontage of about 93ft. to Devonshire Road, and will comprise a lower ground-floor consisting of nine spacious class rooms and an assembly hall, accommodating 400 children simultaneously, and lavatory and cloak room accommodation for boys and girls. The upper ground-floor will be the main floor of the synagogue, and will be approached by a separate entrance from the street. It will contain accommodation for 340 males; the whole of the seats will be placed crossways, and the ark, pulpit, and reading platform will be grouped together at the eastern end of the building. Two self-inclosed staircases will lead direct from the street to the gallery, which will contain accommodation for 210 ladies and two sets of cloak rooms. The total cost will be £7350.

**HALIFAX.**—The Watch Committee of the Halifax Corporation has decided that competitive plans for a new building should be invited, that two prizes of £50 and £25 respectively should be offered, and that the successful plans should be compared as to cost, &c., with the adaptation plans submitted by the Borough Engineer (Mr. E. R. S. Escott), and, if favourable, that the premiated competitive plans should be adopted. There was a divergence of opinion on the Committee as to whether the competition should be limited to the borough architects, but ultimately it was resolved, by eight votes to four, that the competition shall be an open one. The question of having a 54ft. street frontage on Harrison Road was not decided by the Committee, but it is understood that the Council will insist on this as a part of the scheme.

**HARTLEPOOL.**—At the last meeting of the Hartlepool Town Council Councillor Gilooly moved: "That a portion of the market be set apart for public baths to be supplied with fresh and salt water." He said a tank might be constructed near the Fairy Cove Battery, from which pipes could be laid direct to the market, the tank being kept perpetually filled by means of a gas engine. Possibly it might cost £2000 or £3000. The matter was referred to the Improvement Committee.

**IRVINE, N.B.**—The Irvine Parish Church, after being closed for several months for alterations, &c., was reopened a few days ago. The church has undergone a total internal renovation. The reseating of the galleries and area is all new, and the old-fashioned staircases have been inclosed. The church is of the square type, but relieved by a spire worthy of its elevated situation. Mr. John Armour, Irvine, was the architect.

**JOHNSTONE.**—The new part of the Combination Hospital, situated on the Linwood Road, was formally open for public inspection on the 6th inst. The extensions just completed have been executed to the plans of Mr. J. L. Cowan, of Wellington Street, Glasgow, and have cost over £4000, to which will require to be added another £1000 for alterations and improvements on the present hospital, so as to bring it into line with the newest and most up-to-date systems of sanitation and ventilation. Special attention has been directed to the drainage, and when the present extensions were decided upon an additional acre of ground was taken in. The contractors were: For building, Keanie, Lochwinnoch; joiners, Purdon and Cuthbertson, Kilbarchan; plastering, M'Queeny, Glasgow; heating, M'Cormack and Son, Glasgow; painting, J. M'Connell, Johnstone; engineering and laundry work, Tullis and Co., Clydebank; slating, Marshall, Kilbarchan.

**KIRKMICHAEL.**—Mr. Frank Balfour, of Kirdrogan, proposes to erect a large shooting lodge at Pitcarmick and an office connected therewith, also gamekeeper and coachman's house. The lodge will be situated in a beautiful spot in a field near to the road leading to Pitcarmick. The following are the contractors for the lodge:—Mason, Mr. James M'Leish, Rattray; joiner, Mr. D. Morrison, Ballinluig; plumber, Mr. R. Kidd, Blairgowrie; plasterer, Mr. J. Bell, Blairgowrie; slater, Mr. J. Buchan, Perth. The tradesmen for the offices are:—Mason, Mr. James, Easson, Kirkmichael; joiner, Mr. James Small, Kirkmichael; slater, Mr. Joseph M'Gregor, Kirkmichael; plasterer, Mr. J. Bell, Blairgowrie. The plans and specifications are by Mr. Leonard, Architect, Pitlochry.

**NEWCASTLE.**—The new recreation hall which has been built at the Royal Victoria School for the Blind, Benwell Dene, Newcastle, was opened on the 12th inst. The designs for the hall were prepared by Mr. W. Lister Newcombe, and the work has been carried out by Mr. Pringle, of Gateshead, contractor. It is a handsome hall, with interior dimensions of 50ft. by 20ft., and is well ventilated and heated.

**SHOTTERMILL.**—The parish church of St. Stephen's was recently reopened, after reseating and other improvements, by the Lord Bishop of Winchester. The work, which has been executed from the designs of Messrs. Brown and Barrow, Architects, of Amberley House, Norfolk Street, Strand, by Messrs. Harding Bros., builders, of Shottermill, consists of the reflooring of the entire church—the body of the church with oak joists and 1½in. deal flooring, and the nave and entrance with pitch pine wood blocks—whilst the old seats have been replaced by modern seats of Columbian cedar, the wood being given by Mr. J. Ward.

## SOCIETY MEETINGS.

**Dundee Institute of Architecture.**—A meeting of the Dundee Institute of Architecture, Science, and Art was held in the Albert Galleries on Wednesday, the 10th inst., Mr. Leslie Ower, the president, in the chair. The Secretary (Mr. J. J. Henderson) intimated the results of the recent competitions under the auspices of the Institute, as follows:—Sketch Books: 1, Ada Hill Walker, St. Andrews; 2 and 3, Robert Annal, Dundee, and A. G. R. M'Kenzie, Aberdeen—equal; 4, Thomas Ross, Dundee. Measured Drawings: 1, Andrew Haxton, St. Andrews; 2, R. D. Baillie, Cupar Fife. Design for Pediment: A. Hutton, Dundee. Outline Drawings from Museum Casts: 1, Catherine Fidler, Dundee; 2, William H. Grant, Dundee. Interior Glass Door: J. Wyse, Dundee. The referees were Messrs. T. S. Robertson, James Langlands, J. J. H. Spindler, Robert Hunter, and John MacLauchlan. The exhibition as a whole, with the exception of the measured drawings, does not reach the standard of that of last year. A short lecture, entitled "Water Heating by Steam," was afterwards delivered by Mr. Walter M'Gregor, Superintendent of the Public Baths, who explained in an interesting manner the working of the various apparatus in use at the baths in Dundee and Lochee.

**The Institution of Civil Engineers.**—At the meeting on Tuesday, the 9th inst., Mr. John Wolfe Barry, the president, in the chair, the paper read was on "Cold Storage at the London and India Docks," by Mr. H. F. Donaldson. After a brief mention of the methods of importing meat for consumption in England, including the shipment of live stock for immediate slaughtering and of meat in a chilled state as distinguished from frozen meat, the author traced, from the commencement of the experimental stage in 1881, the progress in the accommodation of the frozen meat trade in the Port of London. The work had been carried on—first by the London and St. Katharine and the East and West India Docks Companies, and subsequently by the London and India Docks Joint Committee, which came into existence in 1889—in the construction of receiving chambers at the Royal Victoria Dock, and, later, at the South-West India Dock.

## Correspondence.

### VALUE OF LAND IN LONDON.

DEAR SIR,—Referring to your paragraph in this week's issue showing the value of an acre in the West End, it might be interesting to compare this with the value of an acre in the City, which is well shown by the sale of a property in Cornhill, which in June last, under our hammer, realised a price at the rate of £2,452,023 per acre. This is an interesting comparison, both being unique positions in their respective situations.

Yours truly,  
GREEN AND SON.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayments.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.

Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two. Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements.

Prices on application.

Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

### Editorial and Publishing Offices:

Effingham House, Arundel St.,  
Strand, W.C.

Two schemes are now occupying the attention of the Middlesbrough Corporation, both of which are of considerable magnitude. The introduction of an electric tramways system is the subject of the first. The second is the scheme now projected by the North-Eastern Railway Company as regards the proposed Dock Extension.

## Trade and Craft.

### ANNUAL SPECIAL NUMBER OF "TIMBER."

The publishers of *Timber* have favoured us with a copy of their truly remarkable Special Annual Number, dated Feb. 1st. It is, in every sense, a weighty production, not merely in the matter of avoirdupois, but in the solid and informing nature of its contents. The Timber Trade of Ireland forms the introductory article, and it is treated of in a thorough and exhaustive manner. Mr. W. Sinclair contributes, in the second place, a valuable monograph upon the "Structure and Properties of Pitch-Pine." Mr. F. W. Edwards treats of the nobler woods, mahogany and cedar. Then follow interesting expositions of the virtues and uses of Australia's famous Jarrah and Karri woods. The teak trade of East India, Burmah, &c., concludes the section appropriated to Timber. Special interest centres in the next article—dealing with the slate trade of Great Britain—in view of recent industrial wars. Penrhyn, with its wonderful quarries, forms the initial subject, but the whole Welsh slate trade is admirably considered, and effectively depicted. Chatty sketches of great firms in the trade are added to the more solid information, while the work

is fitly closed with a succession of illustrated notes upon the latest productions in machinery as applied to the requirements of timber and its working. This Special Number is phenomenal. Its store of information is voluminous and valuable. From beginning to end the text is elucidated by admirable illustrations. We have derived pleasure from its perusal, and have gained some additional knowledge as well. But one thing seems to be lacking—an index of contents; unless it be that there should also be index of advertisers—a body whose numbers here are formidable, and whose calls for attention necessitate the use of over a hundred pages of print. Yes, an index is wanted, and badly, amid such a clamorous crowd of competitors for custom.

### WHAT IS A STREET?

A case of some importance alike to local authorities and owners of property was recently decided by a local bench of magistrates sitting at Wetherby. It was an action in which the Wetherby District Council sought to compel Mr. Benjamin Hewling, of Boston Spa, builder and contractor, to set back a certain wall on the Thorparch-road at Boston Spa. Practically, the point in dispute was as to whether the portion of the road in question was a new street within the meaning of the Local Government Act, and thence arose the further question, "What constitutes a street?" In March last, legal proceedings were instituted by the Council against Mr. Hewling in respect of the carrying out of certain plans which he had previously submitted to that body. The plans in question had originally been approved in 1891, and, according to the contention of the District Council, provided for the removal of the wall in dispute to a distance of 18ft. from the centre of the road, as would be required under the District Council's bye-laws for the making of a new street. Subsequently, however, Mr. Hewling refused to set back the wall, and in April last was summoned before the magistrates at Wetherby, and fined. The fine and costs were paid, but still the defendant declined to carry out the wishes of the Council, with the result that in July a second summons was issued against him. On this occasion the Bench dismissed the case, but the District Council pursued the matter to the High Court. The action came before Justices Wright and Gainsford Bruce during last month in the Queen's Bench Division, and their Lordships decided to refer it back to the Wetherby Bench, with certain instructions, for decision upon the facts.—The magistrates announced that they had decided that they had no reason to alter their previous decision.

### A QUESTION OF CONTRACT.

The building of these halls, which are in course of erection with funds bequeathed by the late Provost Beveridge, Kirkcaldy, any money publicly subscribed in Kirkcaldy and neighbourhood for the erection of a memorial to Adam Smith, author of "The Wealth of Nations," a native Kirkcaldy, has just been the subject of a litigation in the Sheriff Court. Some time ago the Town Council of Kirkcaldy, in whom the money for the erection of the halls is vested, asked the Sheriff to interdict the defender, Alexander Waddell, builder, Burntisland, who is the contractor for the joinery work, from removing the tools, sheds, and other erections placed temporarily on the ground by him for his own use, and for the use also for the other contractors for the work until the completion of the buildings. It appears from the pleadings that the Town Council and defendant had disagreed as to the carrying-out of the contract for the joinery work, and after negotiations the former resolved to relieve the defendant of the contract and finish the work themselves. The work done by the defendant was measured, and the pursuers offered him the value thereof, which he did not accept. The defendant threatened to remove the wooden sheds and other erections, but the Council objected to their removal until the completion of the work. The contract for the joinery work

contained a clause to the effect that in the event of any disputes or differences arising between the parties the same should be referred to the decision of an arbiter named, whose decision should be final and binding on both parties, but no such reference was entered into for a settlement of the differences which arose. In defence of the action the defendant, *inter alia*, pleaded that the action was barred by the reference clause in the specifications, and that it ought to be dismissed. The Sheriff-Substitute (Gillespie) before whom the action was heard has now pronounced judgment, giving effect to the defendant's plea, that the action was barred by the reference provided for in the specifications, and dismissed the action with costs.

### ELECTRIC LIGHTING AT YORK.

At a special meeting of the York City Council held on the 8th inst., in reference to the electric lighting question Professor Kennedy said he gave the probable outlay for plans and mains as £12,000. The tenders for both the sections which covered this work amounted to £11,252, so that his estimate covers ample allowance for contingencies and additions in connection with the cables and roadwork. The schedule prices for the first 100 services and meters come to £695, so that his allowance of £1000 covered ample margin. For the arc lighting of the streets he mentioned the sum of £600 to £700, but the actual outlay would depend largely on the design of the lamp chosen, but in any case it would be below that estimate.

### RAILWAY EXTENSIONS.

A considerable portion of the Great Northern Leen Valley Railway extensions has been opened for mineral traffic, and henceforward an extensive coalfield will have provided for it an alternative route by which the mineral can be conveyed to its consumers. The colliery district embraced within the counties of Derbyshire and Nottinghamshire has recently received a goodly share of attention from competing railway companies, and the extension under notice is a typical instance of the enterprise which has been displayed by more than one company in an endeavour to serve a vast trading community.

### HEAVY COMPENSATION CLAIM.

Mr. Under-Sheriff Burchell and a special jury sitting at the Hotel Cecil have had before them the arbitration case of the United Realisation Company v. the Trustees of the late Mr. Arthur Jones. It was a case in which damages had to be assessed in respect of the compulsory acquirement of the freehold of Nos. 80 and 81, Strand, for the purpose of widening the approaches to the Hotel Cecil, and the Strand Improvement scheme. Sir William Marriott, in opening the case, said the Hotel Cecil formed one of the groups of the schemes projected by Jabez Balfour in connection with the Liberator group. Prior to the hotel being taken over by the Realisation Company, it had been allowed to go into a state of decay. Since the hotel had been taken over and opened up, the question of the widening of the approaches was brought home to the minds of those interested, and steps were taken to acquire the premises in question for that purpose. Under a will of the late Mr. Jones, it was provided that whatever money was realised from the sale of the property in question must be invested in Government securities. Upon the property was a lease, of which 56½ years had to run. The only question before the jury was what amount should be awarded the claimants. As he had said, 56½ years of the lease remained, and the premises were let at a rental of £400 per annum. On the face of it, that was an excellent investment, and he asked the jury, when awarding damages, to grant such an amount as would guarantee to those who benefited under the will the certainty of that income for the next 56½ years. Evidence was given on behalf of the claimant by Sir Whittaker Ellis, who estimated the amount of

damage, together with compensation for compulsory sale and interest on the reversion, at £19,021. For the Realisation Company, Mr. Freeman contended that the claim was excessive, and called Mr. Robert Vigers and Mr. Douglas Young, who estimated the amount to be awarded at £11,220 and £11,165 respectively. The jury assessed the amount at £16,500, including the 10 per cent. allowance for forced sale, and judgment was given accordingly, with costs.

## A BUILDING CASE.

In the Court of Appeal last week, before the Master of the Rolls, Lord Justices Lopes and Chitty, the defendant's appeal was heard in the action *Harrison v. the Yeadon Urban District Council*. This was a case in which Mr. Harrison claimed an injunction to restrain the District Council from pulling down or otherwise interfering with a coach house and stable which was being erected on a plot of land on the urban side of Cemetery Road, on the ground that the space left was not of sufficient width. They contended that if the building should stand the new street would only be 13ft. 3in. in width, instead of 26ft. 6in., as provided by the bye-laws of the Council. At a trial at the Leeds Assizes Mr. Justice Kennedy granted the injunction, and assessed the nominal damages of 40s.

Mr. Scott Fox, who now appealed, said that the question before the Court was one of the construction of the bye-laws. Although the issues were very complicated, the question to be decided had narrowed itself to small limits. The plaintiff had built in Yeadon certain property, which, for the sake of argument, though it was not named yet, might be called Carlton Terrace. It consisted of a row of nine houses, the fronts of which opened on to a narrow pathway, but the backs of which opened on to a road which gave the only access to carts. It was at the back of one of these houses on which the stable and coach house were built. He desired to contend that that roadway was a new street, and thereby came under the bye-laws. The width of their streets should be 26ft. 6in., but the plaintiff had narrowed their street to 13ft. 3in. He desired the Court to say that this was a street within the meaning of the bye-laws before a brick had been laid down to the coach house. The Court, without calling on the other side, dismissed the appeal.

## A TENANT'S LIABILITY.

At the Sheffield County Court last week, his Honour Judge Waddy finished the hearing of and gave judgment in the case of *Crawshaw v. Unwin*, which he had before partly heard.

The parties were respectively landlord and tenant of the house No. 14, Gatefield Road, and the plaintiff's case was that Unwin went out leaving the house in such a dilapidated condition that an expenditure of nearly £5 had to be incurred to fit the place for the next incoming tenant; and for that sum he sued. Further evidence was called by Mr. Ellison to rebut the plaintiff's allegations that damage over and above fair wear and tear was done in the house during the defendant's tenancy. Mr. H. Jenkinson, of 9, Gatefield Road, a neighbour, attributed the bad appearance of the rooms largely to dampness, which had discoloured the paper hangings, and also had turned the green paint yellow. He saw no evidence of wilful damage. The present tenant of 14, Gatefield Road, Mr. Richard Pexton was also called. The rooms were re-papered, he said, when he went in, and the paper had already shown signs of dampness. Mr. Edward Holmes, Architect, said he saw the interior of the house after Unwin left, and he noticed nothing inconsistent with ordinary wear and tear, except, perhaps, some marks which indicated that the persons who had cleaned the windows had stood on the window ledges and damaged the paint with their shoes. Judgment for plaintiff for 5s. 6d. cost of painting.

Perfect Sanitation, Healthy Houses

OBTAINED BY ADOPTING THE

"TWYCLIFFE"  
Patent Pedestal Syphon  
W.C. Basin.

A new Departure, embodying the latest developments in Sanitary Science, as applied to W.C. Basins.

Advantages claimed for the  
"TWYCLIFFE" Syphon:

Perfect safeguard against sewer gas and the evils arising therefrom.	Practically noiseless in action.
Extra large water surface and great depth of water seal (3 inches) and large body of water in Basin to receive and deodorise soil.	Simple in construction, reliable in action.
	No complicated mechanism to get out of order.
	Easily fixed as an ordinary Basin.

High-Class Article of Superior Material, Workmanship and Construction.

TWYFORDS, Ltd., Cliffe Vale Potteries, HANLEY.

## ECONOMY IN BUILDING.

INCREASED COST.

### "DRIPLESS" LIGHTS.

So constructed as to prevent the Condensation falling on anything which happens to be below.

### WILSON'S "SAFETY" PAVEMENT LIGHTS.

These are made with lead between the glass prisms, and prevent slipping, as well as doing away with the studs.

### WILSON'S IMPROVED PATENT HORIZONTAL FLOOR & ROOF LIGHTS

in complete form, sealed, and endorsed "Tender for Sewage Disposal Works," on or before MARCH 3rd.

The Council do not bind themselves to accept the lowest or any Tender.

Parties tendering must do so at their own cost, and their attention is specially called to the Conditions of Payment.

CHARLES DAWSON, Solicitor,  
Clerk of the Council.

Public Hall-chambers, Uckfield,  
February 8th, 1897.

**TO BUILDERS.**

CITY OF CANTERBURY.

BEANEY INSTITUTE (PUBLIC LIBRARY, &c.).  
The Mayor and Corporation are prepared to receive  
TENDERS from competent Builders for the ERECTION  
and COMPLETION of the NEW BUILDINGS within

the City of Canterbury to be devoted to the purposes of a Public Library and Institute.

The plans and specifications may be seen at the Office of the Architect, Mr. A. H. CAMPBELL, City Surveyor, 28, St. Margaret's-street, Canterbury, from whom also schedules of quantities (prepared by an independent Surveyor) may be obtained on deposit with me of cheque for Five Guineas returnable upon receipt of a bona fide Tender and after the contract is settled.

Tenders, upon a prescribed form, properly filled up, sealed, and endorsed "Tender for Beane Institute," to be lodged with me, the undersigned, not later than TEN a.m. on MONDAY, March 1st next.

The lowest or any Tender may not be accepted.

HENRY FIELDING,

Town Clerk.

No. 15, Burgate-street, Canterbury.

### UCKFIELD URBAN DISTRICT COUNCIL.

SEWAGE DISPOSAL WORKS.

The Uckfield Urban District Council invite TENDERS for certain WORKS OF SEWAGE DISPOSAL, in accordance with the Drawings and Specifications and Conditions of Contract, which can be inspected at the Office of their Engineer, Mr. G. MAXWELL LAW-FORD, 13, Victoria-street, Westminster, on or after FEBRUARY 15th, and from whom the form of Tender and Bill of Quantities can be obtained.

Tenders must be filled in and delivered at my Office

## PLANNING OF SMALL HOUSES.

By H. V. LANCHESTER, A.R.I.B.A.

### No. II.—TERRACE HOUSES.

THE first two plans illustrated this week are suggestions for treating sites where the ground falls slightly; in the first case (No. 2) away from the road, and in the second (No. 3) towards it. No. 4 is drawn for a level site, but it would be suitable for adoption where the garden at back is somewhat higher than the road; in each of these three plans the rooms at the front of the house are on a different level to those at back, the short flights of stairs carrying one alternately from the one level to the other. Such an arrangement as this offers substantial advantages in exchange for some drawbacks of a more trivial character.

In the first category one may note the compactness and economy of passage room, the superior position of the principal back rooms with regard to the garden, better access to the kitchen offices, and more disconnection for them than usual in a house of the size, and generally a more interesting scheme due to the variety of level. On the other hand, some might consider the small flight of stairs between kitchen and dining-room objectionable; though it might fairly be regarded as equalised by the shortness of the route between these rooms. There is also a less degree of privacy in one or two of the bedrooms, though these again are better placed in the case of their being utilised for additional sitting-rooms, as might frequently occur in the case of a small family. It is obvious, indeed, that by this arrangement the line of demarcation between sitting-rooms and bedrooms is necessarily less marked than when the latter are on a separate floor; but a house on these lines has a certain flexibility of character, as it may be termed, that renders it more adaptable to varied requirements. Considering the designs more in detail, it will be seen that in Nos. 2 and 4 a separate tradesman's entrance is obtained. No. 3 could only secure this by means of access from a back way, if such were provided. This system of providing back passages for tradesmen and for access to gardens was largely adopted in estates laid out some thirty or forty years ago, and no doubt has advantages in the case of terrace houses with gardens of any size; it is, however, in much less use at the present time; partly, I should say, on account of its diminishing the privacy of the garden, and partly by reason of the liability of such passages to become neglected and to accumulate unsavoury rubbish. If adopted they should always have an impermeable paving, should be at least 8ft. in width and open at both ends. Returning from this little digression to the consideration of our plans, it may be suggested that a certain diversity of outline is desirable where houses are packed together in terraces; for instance, where the porches are grouped together in plan No. 2 they can be carried up to a gable which may be varied in

form and treatment, or the different blocks in No. 4 can have such modifications in the form of roof, distribution of windows, and other details, as to avoid the monotony of uniform repetition. Even where no projections or recesses break up the façade, as in No. 3, a great deal could be done by such variations as those described. Should the amount of ground permit, terraces should be divided into groups of six or eight houses, the opening between each block allowing the air to circulate more freely round it, thus keeping the space at back sweeter and fresher than it would be if entirely built up. In addition, the different design of the semi-detached house at the end of the block gives an air of variety and inte-

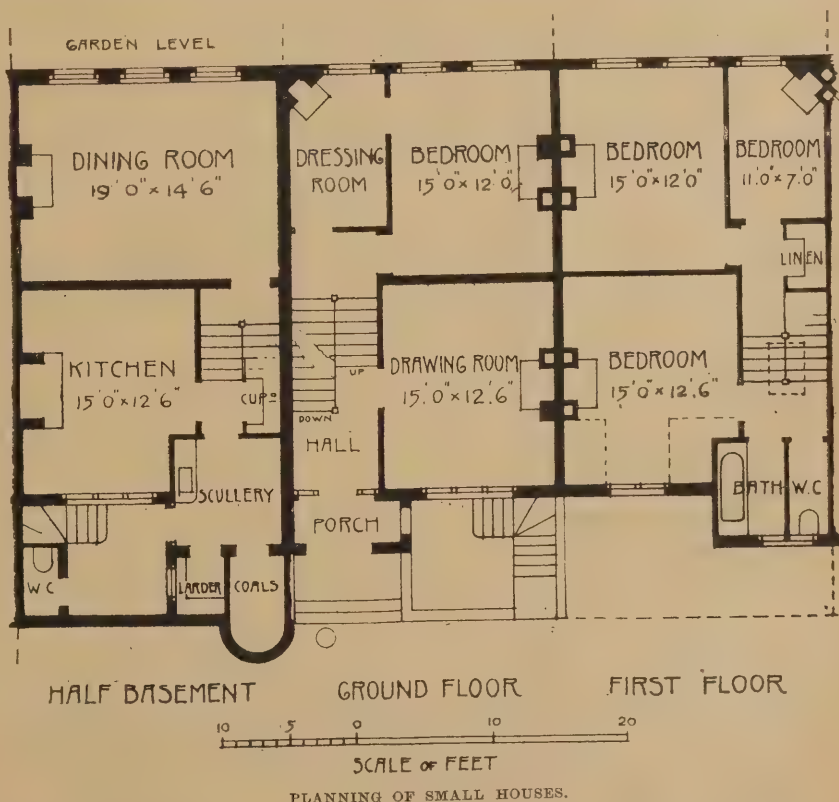

## WORKHOUSE PLANNING.

By GEORGE H. BIBBY, F.R.I.B.A.

### No. I.—INTRODUCTION.

THE housing and relief of the poor and destitute (so far as it was attempted in the Middle Ages) appears to have chiefly devolved upon the monastic institutions; these voluntarily provided for the performance of duties which are now enforced upon the public by modern poor-laws; as an instance, the Hospitallers bound themselves to relieve casual destitution, the preaching and begging friars

NO. 2 TERRACE HOUSE 20 FT FRONTAGE. — CUBE AT 12 = £90

PLANNING OF SMALL HOUSES.

rest to the road that cannot but make it more attractive. My own opinion is that the terrace is, to say the least of it, a mistake, and that, if the value of the land necessitates covering it so closely, the buildings might more satisfactorily take the form of flats, with a good deal more open space allotted to them than is usually the case, thus giving room for games, promenades, &c., instead of the ground being cut up into numberless small fragments that are absolutely useless for any practical purpose. However, the demand for terrace houses no doubt exists, and must, consequently, be supplied.

were frequently the nurses of the sick and infirm, especially during the times of the plague, or "black death." Houses then existed where gifts of bread and beer were given to those who were in need, and where clothing and hospitality were provided; but, although it is not improbable that these institutions created pauperism to some extent, yet, that they greatly assisted many who needed help from no fault of their own, cannot be denied, and it is certain that for many years immediately following the destruction of monasteries, the poorer classes suffered great privations by

N<sup>o</sup> 3 TERRACE HOUSE - 20 FT FRONTAGE - CUBE AT 12 = £105

reason of the absence of all organized means of relief.

The monasteries having been thus swept away, and the funds for their support devoted to purposes for which they were never intended by the donors, it was quickly perceived that the general public of the period, being unaccustomed, were also very unwilling to provide sufficiently for their paupers, but in the last year of Edward VI. two collectors were appointed for every parish to obtain contributions for the relief of the poor. These subscriptions appear to have been voluntary, but later, in the reign of Elizabeth, the justices were, for the first time, empowered to levy taxes upon the inhabitants for these purposes.

The next advance appears to have been the assessment of property under the Act of 43 Elizabeth, cap. 3. This was originally intended as a temporary measure, but in its general principles continued until the introduction of the Poor Law Amendment Act of 1834. Prior to the passing of this Act, paupers were relieved by the overseers of the various parishes, and where these were of sufficient extent or importance, or the population considerable, there was provided the building known in later times as the "Poor-house."

The structures thus designated were frequently mere ranges of two-storey sheds, without any connecting corridors, so that inmates had to pass through open yards to reach their dining apartments, &c., while those who occupied rooms on the upper floor could only get to them by means of exterior step-ladders and open galleries, all exposed to the open-air.

The accommodation provided in certain poor-houses of this description sixty years ago, consisted of a series of dormitories, each 15ft. by 10ft. by 7ft. on the ground floor, the rooms on the upper floor being another foot in height. In each dormitory about seven inmates slept, with an allowance of 150 cubic feet each. No fireplaces were provided except in the halls or day rooms and the dining-rooms. One privy for the males and another for the females completed the accommodation for the paupers, and there were no bath-rooms.

The only further apartments were committee and governor's rooms, kitchens, and wash-house, with two enclosed yards. Even with such simple arrangements, it is surprising to learn that this type of poor-house could be erected at the exceedingly low price of £8 or £9 per bed.

No Architect originated this system of planning, and the principle of the scheme is, in its author's words, thus stated: "The height of the rooms, the thickness of the walls, &c., should not exceed the dimensions of the

cottage of the honest, hardworking, independent labourer, well-built, substantial rooms being a luxury as attractive to the pauper as food and raiment!"

There yet exists in London the old poor-house of a metropolitan parish, very much in the same structural form as at the commencement of this century, although long disused for public purposes. It contains such low and stone-paved apartments and timber galleries as are mentioned by Charles Dickens in "Oliver Twist" and elsewhere, and possibly he thought of such poor-houses as these when he wrote: "The room in which the boys were fed was a large stone hall, with a copper at one end, out of which the master, dressed in an apron for the purpose, ladled the gruel at meal times." From this description one may conclude that the dining-room and kitchen in poor-houses of that period formed one apartment.

The structural arrangement of the first buildings used as workhouses (after the passing of the Poor Law Amendment Act) were such as provided for the accommodation or employment of those paupers who either could not or would not work, but owing to the greatly altered state of public opinion and the circumstances of the present time, Poor Law buildings are now arranged in divisions and sub-divisions which did not formerly exist when the great object attempted was the suppression of those able-bodied paupers who unduly claimed help. There are now many divisions and classifications in large workhouses, while even in the smallest institutions provision must be made for classifications formerly entirely disregarded.

A complete workhouse for a large Union will usually comprise the following buildings, with separated divisions and yards for each sex:—

1. Entrance and Reception buildings.
2. Vagrants' wards.
3. Main buildings.
4. Imbeciles' wards.
5. Schools.
6. Sick and Infirm wards.
7. Isolation wards.

All these divisions of buildings are not absolutely necessary in the case of small work-houses, providing that the number of inmates and officials is very limited, but the Local Government Board state that the complete workhouse above referred to should, on the other hand, not be constructed to contain more than one thousand or, at the most, fifteen hundred inmates; where the total number of in-door poor exceeds that number, it is preferable to form two or more distinct institutions, and it is desirable, even with the lesser number,

N<sup>o</sup> 4 TERRACE HOUSE - 25 FT FRONTAGE

CUBE AT 12 = £125

that detached buildings, quite beyond the precincts of the workhouse for the adults, should be erected for the children.

It is essential that there should be a complete separation of the sexes, and also, as far as may be, of classes; and, for these purposes, distinct dormitories, day rooms, entrances, staircases, yards, water-closets or earth-closets, lavatories, &c., should be provided for each sex and class. This is for the purpose of securing complete and efficient classification of the inmates of workhouses, without which it would be difficult to maintain the discipline that is necessary in all well-managed institutions. Efficient classification also tends to promote facility of supervision and management. In the case of workhouses in large towns and in the Metropolis the children are often quite away from the adults' workhouses. The sick also are usually separately provided for, as also are the harmless lunatics and the infectious cases; and the workhouses for adults in health are, in many instances, arranged exclusively for special classes, as for the old and infirm, the able-bodied, &c.

In the Metropolitan district there are some Acts in force which do not concern the workhouse arrangements in the provinces, these relate, amongst other things, to the manner of calculating the spaces for the accommodation of the inmates—it is desirable that the various blocks or pavilions should not be for very large numbers of persons. Upon this subject Dr. William Farr, in "Vital Statistics," states: "The collection of a number of persons exceeding those of an ordinary family under one roof, has hitherto had a tendency to increase the dangers of disease, for certain diseases are, like fire and ferments, diffusible; the danger is increased when all the patients are sick, for their breath and excretions spread through the wards: the dangers, too, are likely to increase in a faster ratio than the numbers, and the patients are less likely to recover health in the sickly atmosphere of a larger building in a city than in a pure country air."

The several classes of paupers for whom accommodation has to be provided in large workhouse establishments is as follows, each class having separated sections for the sexes: Aged and infirm; Able-bodied; Harmless lunatics and imbeciles; Sick of all classes; Children; Infants; Aged married couples; Probationers; Vagrants. Therefore in a large workhouse there may be, for the two sexes, at least eighteen blocks of buildings or divisions of the institution, exclusive of entrance buildings, administration buildings, offices, and other necessary structures. For the purpose of avoiding cheerless and built-up yards, for access of light to the rooms, and for securing a free circulation of air about the buildings, the Local Government Board require that the blocks of buildings should not, except where unavoidable or for exceptional reasons, be directly connected at a right-angle or an acute-angle; for kindred reasons adjacent blocks of buildings should be placed sufficiently far apart to allow free access for light and air, and should also, where practicable, have such an aspect that the direct rays of the sun may pass between them during several hours of the day. It is therefore advisable that the distance between adjacent blocks of buildings should be, at least, equal to twice the height of the higher of them; this frequently involves the spreading of the buildings over a considerable area of ground. For the purpose also of securing access for light and air to workhouse buildings, and in order to avoid communications between inmates and the outside, no building occupied by inmates as sleeping or day-rooms should be erected on the boundary of the premises, unless at right-angles thereto, or in such a manner that windows and ventilators are not required in the wall resting on the boundary. To avoid inconvenience in management and supervision, the various wards or suites of rooms should not be of great extent, therefore one room or suite of rooms should seldom exceed one hundred feet in length. As in the case of hospitals and asylums it is necessary that the length of a workhouse ward or dormitory should be calculated according to the number of beds to be placed in it, and the

requisite amount of wall-space required per bed, otherwise there might be waste of space and unnecessary expense, for similar reasons the doorways and fireplaces of dormitories should be arranged so as to interfere as little as possible with the spaces occupied by beds; dormitories, day-rooms, and wards for all classes of inmates should be so arranged as to be supplied with adequate means of through ventilation by opposite external windows, distributed throughout their entire length. With the exception of infants sleeping with their mothers, and of aged married couples, every inmate should have a separate bed, and each bed should stand in the centre of its own allowance of wall-space; with certain exceptions the beds should be placed with their heads against the side walls of the wards or dormitories; in the case of existing buildings, where two rows of beds are placed in a ward, 16ft. or less in width, the beds may be placed with their sides to the wall.

In the course of the following seven articles, I propose to give descriptions, with plans of each of the main divisions of a workhouse, in the following order: 1st, Entrance and Reception Buildings; 2nd, Vagrants' Wards; 3rd, Main Buildings; 4th, Imbeciles' Wards; 5th, Schools; 6th, Sick and Infirm Wards; and 7th, Isolation Wards.

(To be continued.)

It was reported at the last meeting of the Police Commission at Arbroath that the total cost of the new well at Warslap up to the present was £1128 18s. 2d. The Borough Surveyor reported that the average quantity obtained from the well during the past fortnight had been 220,000 gallons per day.

The Trowbridge Urban Council has resolved to spend a sum not exceeding £500 on experimental works founded on the septic system. The surveyor has been instructed to prepare the necessary plans, &c. It is intended to proceed with the experiments as soon as the necessary drawings have been made.

Dr. Meredith Richards, medical officer for the borough of Chesterfield, referring to the necessity of an isolation hospital says the only provision at present is the temporary structure at Haiby Lane. A site of twelve acres has been purchased at Hasland, at a cost of £1200, and the question of erecting a permanent hospital seemed to have come within the region of practical possibilities.

Major-General H. D. Crozier, C.E., on behalf of the Local Government Board, has held an inquiry at Kirkheaton with respect to the issue of a provisional order for the compulsory purchase of five acres of land, required by the Urban Council for sewage disposal for the inner district of the township. Under the scheme the whole of the sewage of the district will be dealt with by gravitation on the land on the Ives' system of chemical precipitation, and a provisional contract has been entered into.

The District Council Public Works Committee held a meeting last week at Barry Docks, Mr. W. Thomas presiding. Plans were submitted by the surveyor, Mr. J. C. Pardoe, for the widening and improvement of the highway from the Royal Square, Cadoxton, to Colebrook Bridge, and working plans were ordered to be prepared for the Church Road improvements.—A sub-committee was appointed to wait upon Mr. R. Forrest with the view of securing some land belonging to the Romilly Estate opposite The Parade, Barry, for laying out as public gardens. In view of the alleged inefficient manner in which certain public works had been carried out in the district, it was moved that it be an instruction to the council to exercise greater discretion in future as to the tenders of contractors which they accepted, especially to beware of accepting the lowest tender; and that the surveyor be allowed another clerk of works, there being at present only one clerk of works, quite inadequate to exercise due supervision over all the works in progress in the district. Eventually it was resolved that the matter be deferred pending a systematic visit of inspection of the district works at present in course of execution.

## WORKMEN'S DWELLINGS IN MANCHESTER.

### THE SURVEYOR'S REPORT.

THE Sanitary Committee of the Manchester Corporation has for some time past been considering proposals for utilising for the purpose of tenement dwellings and cottages for working men, a number of building sites now in possession of the Corporation. A scheme, based upon recommendations contained in a report of the City Surveyor, will, says the *Manchester Guardian*, be submitted to the City Council for adoption at its meeting to-day. The Surveyor says:—"The total number of persons to be housed is 2584. The sites known as the 'Oldham Road area' and 'Pollard Street area' are to have buildings so constructed as to contain in the aggregate not fewer than 2034 persons. The Oldham Road area is divided into two building sites of nearly the same size. Tenement dwellings of five storeys have been erected upon the east portion of the site between Spittal Street and Bengal Street. These dwellings contain 235 double rooms and forty-eight single rooms, and accommodate 848 persons. The remainder of the site between Spittal Street and Cornwall Street is available for the erection of additional buildings. The Pollard Street area is covered by tenement dwellings very similar to those that have been erected on the Oldham Road area. These dwellings consist of 130 double rooms and five single rooms, and accommodate 448 persons; this leaves a balance of 738 persons still to be provided for on the Oldham Road area. 300 persons are to be housed on the Chester Street area, and 250 persons on the Pott Street area, making a total of 1288 persons still to be housed." In order to obtain accommodation for this number of persons without having recourse to high buildings similar to those already erected, the City Surveyor has examined the other sites belonging to the Committee which may be utilised for the erection of

### LABOURERS' DWELLINGS.

A plan is given which shows the position of five building sites, situated in Oldham Road, Chester Street, Pott Street, Harrison Street, and Pryme-street. The railway stations, tram routes, and the distances of the sites from Albert Square are indicated on this plan. With regard to the Oldham Road area, the plan adopted provides for buildings to front Oldham Road, four storeys in height, and to consist of thirteen shops and dwelling-houses, with frontages varying from 19ft. 3in. to 29ft. 6in. The first, second, and third storeys would consist of five-roomed dwellings, connected with the shops. The buildings on the remaining portion of the site would consist of two rows of two-storey tenement buildings, fronting to a new 12 yard street, and one row of five-roomed cottage dwellings, fronting to George Leigh Street, which is 18 yards wide. The clear space between the buildings at the rear would vary from 58ft. to 55ft. in width. The four rows of buildings would afford accommodation for 377 persons.

### THE ESTIMATED COST

of erecting these buildings is £17,901, equal to £36 15s. 3d. per person. The estimated cost of sewerage and paving the new streets, exclusive of the cost of widening the existing streets, is £900, to which must be added the estimated value of the site, viz., £7981, or a total of £26,782. On the Chester Street area it is proposed to erect four blocks of buildings, with frontages to Chester Street, Marsland Street, and Hulme Street. The buildings would be two storeys in height, and each dwelling would consist of two two-roomed and two three-roomed tenements. These buildings would afford accommodation for 306 persons. The estimated cost of these four blocks is £11,873, equal to £38 16s. per person, and the estimated cost of new streets, exclusive of street improvements, is £350. The estimated value of the site, which has an area of 4554 yards is £2277, or a total of £14,500.

### AN ALTERNATIVE SCHEME IS SUBMITTED.

On the Pott Street area it is proposed to erect two blocks of four-storey tenement dwell-

lings of a similar character to those already described for the Chester Street area. The buildings would accommodate a total of 400 persons. It is proposed to widen Pott Street, Sandford Street, Caroline Street, and Wharf Street, making the width of these Streets in each case 14 yards. The estimated cost of the buildings is £15,357, equal to £38 7s. 10d. per person, and the estimated cost of new streets, exclusive of street improvements, is £164. The estimated value of the site, which has an area of 3914 yards, is £1957, or a total of £17,478. The committee recommends the Council to approve of and authorise (subject to the sanction of the Local Government Board) the erection of a model lodging-house in Harrison Street, in general accordance with the sketch plans prepared by the Surveyor. Certain proposals contained in the report of the Surveyor with respect to Pryme Street were withdrawn.

#### SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE monthly meeting of the members of the Sheffield Society of Architects and Surveyors was held at the School of Art, Arundel Street, last week, when Mr. John Slater, B.A., gave a lecture on "The Buildings of the Ancients." Mr. C. Hatfield (president), occupied the chair, and among the members present were Messrs. R. W. Fowler (vice-president), F. Fowler (hon. treasurer), C. J. Innocent (hon. secretary), E. M. Gibbs, Joseph Smith, Thomas Winder, W. J. Hale, J. R. Wigfull, C. B. Flockton, C. M. E. Hatfield, Alwyn H. Holland, Edmund Winder, jun., J. T. Cook, J. B. Mitchell-Withers, and many others. Mr. Slater, at the outset, quoted the late Mr. Ferguson's remark that beauty in architecture consisted not so much in particular features as in appropriateness of design and elegance of detail. In the present century there had been many changes of style. Each successive period had found ugly and unsuitable what had been praised as fit and beautiful by its predecessor, thus showing the narrow-mindedness of those who posed as the directors of the public in matters of taste. It might not be uninteresting to go back to a time anterior to all the recognised styles, and see what kind of buildings were erected by the ancients, when the sole object was to meet the requirements of the people for whom the building was intended, and who obtained Architectural effects by ornamenting their construction, and not by constructing their ornament. The great feature of the Egyptian temples was their solidity and massiveness, but relieved by the most elaborate and varied system of colouring, the granite columns having been coated with stucco before the application of the colour decoration. Crossing from Africa to Asia, different materials and methods of building were found, sundried and burnt bricks forming, in the absence of stone, the staple building materials. After alluding to recent discoveries in the district anciently called Phrygia, and to some curious examples of the exact imitation of wooden forms in stone, the lecturer concluded by saying: "As the byways of the world become opened up to us, we are continually finding unexpected remains of building nations, and it is not too much to say that wherever over the whole face of the earth, explorers have come upon the relics in stone or brick of a remote civilisation, their wonder has been excited at the solidity, and in many cases the high artistic quality of the work. It appears to me that, despite all our modern resources and all the discoveries of science in these latter days, no one can study such buildings as I have brought to your notice this evening without having a little of his nineteenth century conceit taken out of him; for truly all the remains testify that in energy and in intelligence, and in skill, there must have been giants in those days."—The paper was illustrated by a number of large diagrams.

MR. D. BALFOUR, of Newcastle-upon-Tyne, has been instructed by the Newport Pagnell Rural District Council to prepare a scheme of main sewerage and sewage disposal for the town.

## Surveying and Sanitary Notes.

AN application has been made by the Sandgate District Council for power to borrow £1000 for sewerage works, and the usual Local Government Board enquiry has been held by Col. W. Langton Coke.

THE Committee of the Keighley and District Hospital has agreed that it is necessary to at once proceed to enlarge the premises so as to make room for forty beds more—that is, to double the existing room—and to erect an administrative block. To do this will probably involve an outlay of not less than £15,000.

To provide for the completion of the North Street and Cavendish Street improvements, the Keighley Town Council will be asked at their next meeting to sanction an application for further borrowing powers to the amount of £40,000; and to instruct the Town Clerk to ascertain as soon as practicable the value of the remaining scheduled properties. There is a considerable increase in the number of plans for sanction.

THE object of the Surveyors (County Dublin) Bill is to confer on the Grand Jury of the County of Dublin the power of appointing one surveyor, with one or more assistants, for the whole county, instead of two surveyors, without assistants. The Grand Jury of every other county in Ireland, consisting of two divisions, was given by an act of the year 1893 the power of appointing one district surveyor for both divisions, instead of one surveyor for each division, and in all other counties except the County of Dublin the power has always existed of appointing assistants. A vacancy having arisen in the office of one of the two district surveyors of the county, the proposal is now made to put the County of Dublin in the same position in this matter as all other counties.

THE 204 members who carried the second reading of the City of London Sewers Bill will probably live to be ashamed of themselves, says a contemporary. This Bill provides that the City Corporation shall absorb the functions of the City Commissioners of Sewers. The latter is a highly efficient body, and there are those who suggest that the former is not. But apart from that it seems plain that so important a measure ought not to have been brought forward as a private Bill. The whole position of the City requires revision and assimilation in one sense or another with the municipal government of London as a whole. Further, it is highly desirable that the lighting and paving of the whole of London should be committed to a central body—not the Corporation—instead of being confided to incompetent vestries. On these accounts, the Bill in question appears a step dead in the wrong direction.

THE heavy rainfall of the past two months has enabled the Leeds Corporation to store a sufficient quantity of water to meet the requirements of the inhabitants for some time to come. The storage reservoirs in the Washburn Valley are overflowing. At a meeting of the Waterworks Committee last week it was reported that there were 2507 million gallons of water stored, which represented 105 days' ordinary supply. At the corresponding period of last year the quantity of water in the storage reservoirs was equal to only 98 days' supply. Some discussion took place at the meeting respecting a contract for 1300 tons of cast-iron water pipes, which the committee recommended should be given to the Staveley Iron and Coal Company. As that firm desired a longer time for the delivery of the pipes than was stipulated in the specifications, the committee resolved to rescind their recommendation of the last meeting, and to ask the Council to accept the tender of Messrs. Cockrane and Co., of Dudley, for £5818 10s.

DR. F. J. WALDO, Medical Officer of Health for the parish of St. George's, Southwark, is an acknowledged authority upon the subject of shelters for the homeless and their sanitary

condition, and the announcement that he would open a discussion on the question drew a large attendance to the Sanitary Institute on Wednesday, the 10th inst. In the course of his remarks, Dr. Waldo pointed out what he regarded as the weak point in the law as it at present affects the shelters to which, as is well known, he has given a great deal of personal attention. The direct evils of improperly conducted shelters might be regarded under the heads of dangers to the public and dangers to the inmates, and, as the institutions in question escaped the control of the local authorities, they could hardly avoid the conclusion that, as centres of actual and potential disease, they became a danger, first to their own inmates, and secondly to the general public. The obvious further conclusion was that all night shelters should be brought within the control of the local authorities, either by a separate legislative Act or by bringing them within the clauses of the Common Lodging Houses Act. Several took part in the discussion, and, in the main, Dr. Waldo's views appeared to be generally accepted with regard to the necessity of legislative reform.

MR. H. CARTER, C.E., and other engineers engaged in business in London write with reference to the London water supply. They call attention to the present action of some of the London water companies in serving notices on owners of houses to take out their three-gallons flushing cisterns and to substitute two-gallons cisterns. They add: "As experienced sanitarians, we have been in the habit of recommending three-gallons flushing cisterns, being satisfied that a two-gallons flush is not sufficient to clear the trap and drain, however perfect their construction, and it is also well-known to us that most of the so-called two-gallons flushing cisterns do not discharge more than a gallon and a half. We consider that such a retrograde movement should not be allowed to pass unchallenged, as it is a serious menace to the health of the metropolis, and we, therefore, take this means of making known our views on this important point. It is quite time that the public should be impressed with the absolute necessity of placing the water supply of the metropolis in the hands of a body of men who will formulate regulations more in consonance with the advance of sanitary science rather than perpetuate the antiquated powers at present vested in the water companies."

IN his annual report to the Local Government Board and the County Council, Mr. Coutts, sanitary inspector of the Ellon district, states that an amount of work in regard to drainage has been carried out in the district during the year. A special water supply district has been formed for the village of Hatton and suburbs, while in connection with several farms a new supply has been introduced, or their previous supply improved. Special inspections had been made in regard to cases of infectious diseases, and in regard to crofters' houses, and also in regard to the erection and alterations of dwelling houses. In the special districts, meetings with the different proprietors to consider the course to be followed in carrying out the drainage of the properties had been numerous. The slaughter-houses in the district had been visited, and found fairly satisfactory. In regard to house accommodations, he says:—"The erection of dwelling-houses for the accommodation of the labouring class is still being pushed forward in the district—thirty new houses have been built, while several others have been greatly improved. On one estate wooden houses are being erected, and in the manner most of them have been erected they seem to be quite comfortable, and most of the tenants seem fairly well satisfied with them. Men-servants' sleeping apartments have also been attended to, and during the year nine new ones have been erected, while a few have been repaired. Some of these apartments are being constructed on approved principles, others are being erected without fireplaces, while others are being repaired merely, notwithstanding the fact that they are situated above stables."

WE see from time to time, **Five per Cent.** as was the case the other day, advertisements with regard to proposed buildings, such as that lately issued by the Metropolitan Asylums Board, in which a definite lump sum is offered, instead of the usual commission, for the services of an Architect. It is noticeable that these definite sums are generally less than the customary five per cent. would amount to, and are usually offered in connection with large buildings. This would seem to imply that, in such cases, five per cent. seems to the advertisers to be too much for the services to be rendered. There is perhaps from their point of view a modicum of truth in this. They may naturally think that in a certain class of simple and straightforward building, such as a hospital or workhouse, in which one wing is an exact repeat of the other, there is not so much work as in a building where no two features are alike. A fee in proportion to the amount spent evidently appears to them more easily earned in the one case than the other, and so they might argue that if five per cent. is enough for a hospital with one wing, it is too much where there are two wings precisely alike. This leads us to remark that we think the time has come for some reconsideration of the method by which an Architect is paid. The present system is allowed by everyone to be unsatisfactory, but has been generally accepted as a compromise, for lack of a better. Taking the simple class of building with the intricate, it is felt that on the average, it is not so unreasonable; but if the class of building which pays best is to be deducted, this average will be considerably lowered. We are not concerned with the reasons which led to the adoption of this system, but would content ourselves with remarking on the curious conception of the Architect and his functions which it displays. Our chief objection to it is this, that the cost of a building, and therefore a percentage on the cost, bears no proportion to the amount of skill and knowledge involved in its production. The cost of a building is no criterion of the skill of its designer. A small and cheap building often takes more time, and involves a greater strain upon the Architect than a large and costly one; evidently he should be paid in proportion to the difficulty of the scheme, and not in proportion to its cost. The cost of a building is largely dependent on the materials employed, and it is no more trouble to the Architect to design in expensive materials than in cheap ones. The alteration of a few words in the specification may make a difference of thousands of pounds in the cost, and the Architect's commission will vary accordingly. We say nothing of the possible temptation to the Architect to increase the cost for the sake of the extra commission, as all reputable members of the profession are above all that; but we may note that a good deal of the Architect's time is taken up, and a great deal of skill displayed, in reducing the cost of the building, and so reducing his own fees. We think this system is to be condemned, if for no other reason than this, that it shows no recognition of the Architect as Artist, and we are of those who believe that unless he is that, he is nothing. Practitioners in other Arts are remunerated according to their skill and reputation. Why

not the Architect? At present this percentage is paid for the production of plans for a building and the superintendence thereof, though there may be no pretence to Architecture, and we see it so paid every day. If there is any Art thrown in, it is the free gift of the Artist, for which he is not paid anything extra, the client getting his Art for nothing; so that it may be said that the whole of the Art lavished on the buildings of London since this system was started was a gift, and has never been paid for. The Architect's duties are not confined to the artistic creation; he has certain business to transact before he can see his design realised. For these duties, which are not artistic, but which many think cannot be so well performed by anyone but the Architect, a fee in proportion to the amount spent

the scheme, which has no necessary relation to its cost; then add to that a certain percentage, as at present, for the preparation of contract drawings and the specification superintendence. The total would be his fees in connection with the work. We think some arrangement of this sort would have many advantages. First, it would secure to the accomplished Artist some recognition of his powers and recompense for his skill. Secondly, it would tend to more equally divide the work, and many people not thinking it worth while to go to an expensive man for ordinary work, the best class of work would get into the best hands, and the best men, by getting more for their work, could afford to give more time to it, and so produce still better. Lastly, it would help to remind the public that an Architect can have

ST. SAVIOUR'S, SOUTHWARK. THE NAVE. FROM A SKETCH BY F. ADCOCK.

might be to some extent reasonable; though even here it is evident that it is no more trouble to specify and superintend costly materials than cheap ones. The Architect's design is one thing; the specification superintendence is another. The first is artistic creation, and should be paid for as such, according to the talent and reputation of the Artist; the second is professional skill, payment for which could be more easily arranged on a certain scale of fees, as in other professions. Taking into account the difficulty of entirely superseding any fixed custom, we think that a practical move in the right direction would be made if the Architect were to charge a certain arbitrary sum for the design, such as his position warrants, and according to the difficulty of

an artistic reputation, which should be paid for in the same way as that of a Painter, Sculptor, or Musician.

**A Third Cathedral.** THE Prince of Wales's attendance at the opening services of St. Saviour's, Southwark, was a fitting acknowledgment on his part of the completion of a great work of Church restoration to which he had set his hand at the beginning. It must have been a pleasure to him to see Sir Arthur Blomfield's work completed. Needless to say, the Church was crowded at the afternoon Te Deum and the festal evensong. It will be a great boon

to all London south of the Thames, but we must not say much on this head, for in these columns we have little to say of spiritual things, except so far as concerns their artistic and external expression. St. Saviour's may now be described as a beautiful Church, reverently brought to its present state, and affording a field, as all great edifices do, for the exercise of the art of the sculptor, the mural painter, the worker in metals, and the makers of music. The body of the building is Early English throughout. It is only in the transepts that you discover the marks of a later style, the perpendicular. The exterior features of the Church are striking, but they are in no respect remarkable. The interior, like the mind of Arthur, is "crowded with many memories," centuries old. Erected originally in the twelfth century by Giffard, Bishop of Winchester, it was destroyed by fire in 1213, and again rebuilt by Peter de Rupibus, another Bishop of Winchester. Indeed, Bishops of Winchester were generous patrons of the Church, for in the fifteenth century Bishop Fox of that See restored the upper portion of the nave which had fallen into decay. After the Reformation, the Church was allowed to fall into neglect, though in Elizabeth's time and later it was enriched by being made the burial spot of many famous Englishmen. In the Lady Chapel is the tomb of Bishop Andrews, saint and scholar; in a bay of the choir aisle is an altar tomb of Alderman Humble, quaint and ostentatious; not far away is a mural monument of some pretension to the memory of John Trebearne, gentleman. In the north transept old John Overs has what the rector calls an "emaciated effigy," as he deserves, for he "lost his life by his own covetousness," though why he should covet we know not, for he was known everywhere as the rich ferryman of London. What vice he had was atoned for by his daughter Mary, who caused the Church of St. Mary Overs to be built. In various parts of the building we find the tombs of Lockyer, the Holloway of his time, which was that of Charles II.; Austin, "in contemplation an angel;" Gower, the first of English poets according to many, for was he not laureate to Richard II., Lady Cobham, and others of lesser degree? The Church has many memories of the dramatists of Shakespeare's time, of Marlowe, Massinger, Ford, and Green. Many of the new windows will commemorate these things. A few words about the Church itself must close this sketch. In its walls are the remains of every style of Architecture, not excepting Roman and Saxon relics. It is the nave that has been the costliest part of the restoration. This has been entirely rebuilt. Standing at the west end you have a view of almost the entire length of the Church. It seems a sweep of fully 300ft., but in reality it is only 200ft. The new stone is remarkable for its whiteness and its comeliness of use. One can see what will be the great feature of the building in time to come. This will be the fine canopied reredos, which, like that of one or two Oxford Churches, will be filled with the carven effigies of Saints from the lowest to the highest tier. London now contains three great Cathedrals, and is in reality three great cities. St. Saviour's will be open daily for prayer, and choral song, and Eucharist, and will doubtless for many centuries to come recommend the sober teaching of a sober Church to millions of our fellow-countrymen. Although the work was practically completed in July last, the reopening of this Cathedral did not take place until Tuesday in last week, which, considering all the difficulties involved, and that the work had to be done a little at a time, may be deemed satisfactory, especially as it has been practically finished for six months. The old nave was built nearly sixty years ago in what was described as "the purest and most debased style of churchwarden Gothic," and which Sir Walter Besant has stigmatised as "a thing of ugliness and meanness." The whole restoration has been accomplished in a little less than seven years. Full descriptions of the work and sketches have been given at various times in the "Builders' Journal," so that little remains to be said. Sir Arthur Blomfield's estimate, seven years

ago, of the cost of rebuilding the nave so that the new building should form with the choir and transepts one harmonious whole, was from £35,000 to £40,000. But the then Bishop of Rochester candidly stated at the time that "anything like an exact estimate at the present moment must be hazardous and premature." The estimate, however, has been at least so near the proved expenditure that, after an outlay of rather more than £40,000, it has been found possible to open the building for public worship. The sum of £7,500 is immediately and urgently needed to pay off debts and complete existing contracts, and a further sum will be required to supply deficiencies of

several windows, the restoration of the tower arcading and the new tower ceiling. The sketches we publish were made from drawings placed at our disposal by Sir Arthur Blomfield.

#### MR. WALTER CRANE AND THE NATIONAL COLLECTIONS AT SOUTH KENSINGTON.

WITH the heavy responsibilities of the present Government in view, especially as regards India, one hardly likes to put forward the claims of Art, but since the subject of the need of a new building for the

detail, so that the ultimate cost must exceed £50,000. Various works are in progress, among them the window openings in the south nave aisle and at the west end, which are, with one exception, subscribed for; the organ-chamber and organ in substitution for the small temporary one now in use, which are being built by a generous donor; the canopied choir stalls, the memorial of the diocese to Bishop Thorold, and the remainder of the choir stalls, which have been given anonymously. A lectern, also, is in course of manufacture, the gift of a widow of a late Warden of the Great Account. Offers are invited of a pulpit, a font, a choir screen,

South Kensington Museum has been opened in the columns of the *Times* I feel bound to say that there can be no doubt that room is very much wanted. We have a collection of decorative design and handicraft of almost every kind and period, which is the admiration of Europe, crowded together in a makeshift building, where it is most difficult to see and impossible to classify and arrange properly in due chronological order or Artistic sequence, as should be done to make such a treasury of Art really intelligible and instructive to the public. As it is many beautiful things have to be put away in dark holes and corners, and there is no space to place new and important acqui-

ons. The important, and practically useful, ries of Architectural models, to scale, of some of the choicest interiors of the early Italian Renaissance (which have been produced at the suggestion and under the superintendence of the present Art director, Mr. Thomas Armstrong) cannot properly be seen, for instance, and the latest addition, a particularly interesting reproduction on a large scale of the room of Isabel d'Este at Mantua (for which it has been discovered that the famous Mantegna pictures in the Louvre were originally painted), cannot at present be properly exhibited at all. It may be said, too, that as regards the value of the museum collection the expenditure of public money has been

#### VERY SMALL

compared to the enormous value (either at an Artistic or market valuation of that collection, which has been further enriched by gifts and bequests alone to the estimated amount of £1,000,000, whereas all the funds voted by Parliament for the museum only amounted to between £200,000 and £400,000, as I am informed. Those who have served the Department in the capacity of examiners from time to time know how cramped they are for space to carry on their vast educational work, which culminates in the national competition every year, the selected results of which from all the schools of the country have to be placed before the public. Whatever differences of opinion there may be as to the value of the educational work of the Department in Art, the results are, at all events, open to the public, so that progress may be gauged from year to year, and there should at least be no hindrances to the proper exhibition of such results for want of space. Large and costly buildings, like the Imperial Institute, apparently, can be erected without any visible reason for their existence, while a national museum of unrivalled beauty and richness, with a great educational influence, might almost be said to have nowhere to display its treasures.

#### ART IN IRELAND.

A MEMORIAL has been laid before the Council of the Royal Dublin Society which states that, being deeply interested in the prospects of Art in Ireland, the memorialists make various suggestions for a systematic encouragement of Art knowledge and a stimulation of artistic activity in Dublin. By the terms of its Charter, the Royal Dublin Society is particularly called upon to care for the advancement of Science and Art. At present the only part taken by the Society in the promotion of the plastic Arts lies in its administration of the Taylor funds. These funds have done something to encourage the Arts of Painting and Sculpture, and to enable young artists to obtain a footing in their profession. But they have not added to the knowledge of, or interest in, artistic matters of the community at large. Such knowledge can best be given, and such interests awakened, by a series of well chosen lectures from acknowledged authorities on artistic matters. A course of six lectures every year, with appropriate illustrations, would be of the greatest possible value in spreading sound knowledge and definite ideas on both the history and the true aims of Art. The completion of the new Lecture Theatre affords a means for carrying out such a scheme as the Society has never before possessed. It has, therefore, seemed good to approach the Society with this petition, and to suggest that the proposed series of lectures might take the following form, with such modifications as the Council of the Society might deem necessary; also that they might be provided at an expense hereinafter estimated. (1) Series of six Lectures on the History of Art: 1, Egyptian Art; 2, Assyrian, Phœnician, and Early Greek Art; 3, Greek Art of the Periclean Age; 4, The Decline of Greek Art and Roman Art; 5, The Art of the Renaissance (I.); 6, The Art of the Renaissance (II.). (2) Series of six Lectures on the nature of the various forms of Fine Art: 1, Architecture; 2, Sculpture; 3, Sculpture;

4, Decorative Art; 5, Painting; 6, Painting. Such lectures as these, if given by men of acknowledged authority, could scarcely fail to excite a widespread interest. They might be followed by further series, covering parts of the same ground in a less general fashion, and affording the specific knowledge which is less common in Ireland than one would like to see it. As to the matter of expense, it is believed that each series of six lectures could be obtained at an inclusive cost of from £120 to £150. So far as the arrangements of the new Lecture Theatre are understood, they seem to lend themselves most admirably to such lectures as those now pressed most warmly on the Council of the Royal Dublin Society.

MR. ROSCOE MULLINS, who has recently received the appointment as master in modelling and sculpture at the L.C.C. School of Arts and Crafts, is engaged in executing a bust of the late Miss Buss, which is to be placed in the Camden School for Girls.

GIFTS of £1000 for the building of a chancel, the erection of an east window, and the re-seating of the nave, and of another £1000 for endowment, have been made to St. Matthew's Church, Cainscross. The cost of the improvements named is estimated at £2500.

THE Haberdasher's Company's Schools at Hoxton are about to be removed from their present location, the buildings having been sold to the London County Council for the purposes of a technical institution. The schools will probably be transferred to Hampstead.

#### KEYSTONES.

THE Lamp Committee of the Leeds Corporation is contemplating lighting the principal thoroughfares in the central parts of the city by electricity. Arc lamps are to be placed on the poles that are to be used to support the overhead wires for the electric system of tramways. It has also been suggested that the requisite electrical current for lighting should be obtained from the central generating station at Crown Point.

At a recent meeting of the Blackpool Town Council a discussion took place in regard to the proposed paving of the new tramway roads at South Shore and North Shore, some members objecting to the cost, and proposing that sett paving should be substituted. The minutes recommended that a sub-committee be appointed to purchase the necessary wood, and eventually the discussion narrowed down into an argument as to the respective merits of hard wood and soft wood for paving purposes. It was resolved to carry out the improvements.

FOR the information of Parliament, the engineer to the East London Water Company has deposited an estimate of £342,000 as the expenditure of capital required by the company in order to construct the necessary storage reservoirs which are proposed by that company's Bill of this Session. The new reservoirs will cover an area of 92 acres on Chingford Marsh, Wild Marsh, and Mitchley Marsh. It is proposed to meet this expenditure by the creation of debenture stock.

MEMORIAL STALLS, ST. SAVIOUR'S, SOUTHWARK. SKETCHED BY F. ADCOCK.

## Some Scottish Houses.\*

By W. J. BLAIN.

(Continued from page 21.)

TO get from Alford to Midmar it is best to take the train down the Don to a station called Tillyfourie. Here you will alight and walk over a flat and uninteresting country, crossing over a low eminence and descending into a valley about halfway between the Dee and Don, watered by nothing in particular, and consisting of a dry clayey soil on which nothing grows of its own inclination. There is a little fertile spot, however, running into a deep gorge of the hill of Fare, and closely and densely wooded, and in the upper recesses of this gorge stands the Castle of Midmar. It is a fine old house, and perhaps owing to the natural strength of its position, has an air of sturdy domesticity which is not found in Crathes or Craigievar. It is not definitely known when this house was built, or by whom, but it must have been about the year 1570, and considerably earlier than Crathes or Craigievar. It has changed hands often during its three centuries of existence, and is now occupied by a branch of the Gordon family. As we noticed in Crathes and Craigievar a similarity in the arrangement of the plan, so in Midmar and Castle Frazer we will notice a similar community of arrangement.

Midmar is designed on what is known as the Z Plan, that is, the L Plan with a tower added to the diagonally opposite corner. In the case of Midmar and Castle Frazer this

tower is circular. The plan consists of the usual arrangement of rooms, the hall and drawing-room being on the first floor, but in this case the hall block is square and comparatively small, while the drawing-room almost equals it in size, and the staircase occupies the whole of the square tower—the tower in the re-entering angle being here done away with. Interiorly the house still retains many of its original features, the walls being panelled in wood, and the ceilings, while comparatively low and simple, ornamented with plaster-ribs and devices. Exteriorly the building consists of plain storeys, the angles being in this case square, with an attic storey having richly corbelled angle-turrets, the round tower rising to the height of six storeys and covered with a flat roof and embrasured parapet. The building rises naturally from the ground, but no doubt this is helped by the latter additions and the little courtyard wall in front.

The glory of Midmar is its round tower. No matter from what view, it always remains the most important feature, the reason for this being of course that a round feature is always bigger than a square, because it has fewer vertical lines. The difficulty the modern student has is to sketch this broad enough, and he will rub out two or three times before he gets it correct.

The details of Midmar are very beautiful indeed, and although the angle-turrets reduce the gable to a mere apology, they are so well connected to the corners and so closely knit to the roof in outline that the unity of the whole building is fairly well maintained. At the open angles of the main block these turrets are formed square, curiously corbelled out, and finished with a small gable with roll-moulding on the edge, and nicely detailed finials. Looking from the north-west, a stair-

turret connects the round tower to the main block, and this is carried above the lower parapet and finished with ogee roof and beautiful weathercock vane, which weathercock, as a matter of design, is well worth studying.

While one leaves Midmar with a certain sense of satisfaction, he will not have those deep, unfathomable thoughts he had on leaving Crathes. The building is too easily

## MIDMAR

understood at first sight, and has none of that subtle, dramatic charm of effect brought about by the proper distribution of rich detail on plain surfaces, which takes so long to unravel, and which remains a joy with you till the end of your days.

The detail here is too much in harmony with the plain surfaces, and although the grouping is perhaps better than either Craigievar or Castle Frazer, after three hours study the student will not have an unconquerable desire to see it again before he dies.

The village of Echt is about a mile from Midmar, and there is a good hotel where you can put up for the night. Echt is a charming little village, situated in the centre of a wide agricultural district, and about sixteen miles from Aberdeen, from which place a bus runs out and in twice a week. The road to Castle Frazer is over nearly the same country as you travelled from Tillyfourie to Midmar, but it lands you two stations further down the Don Railway, at Kemnay, which is the station, and is in close proximity to Castle Frazer.

Castle Frazer is the seat of the Frazer family, who have held the lands since the middle of the fifteenth century. The present house was built in 1576 by the Frazer of that date, and is presently occupied by Colonel Charles Frazer. It is with the greatest difficulty you can get permission to see round the house, and, as for getting inside, there is simply no chance. Castle Frazer sits in the middle of a flat plain, bounded by the Don on one side, and the slight eminence overlying Echt on the other. The policies are very extensive, finely wooded, and are beautifully laid off with walks, while the old avenue, now disused, approaches the house from the east through a magnificent double row of beeches, extending as far as you can see. The plan is almost similar to Midmar; only in this case the main block is larger and oblong, and the round tower is smaller, while the main staircase, which is here circular, occupies only a small portion of the square tower. The withdrawing room thus sinks into insignificance, and the great hall, rising two storeys, with its richly plastered barrel vault and fine end window, again assumes predominance over all the other rooms of the house. The plan is a very fine one, the parts being properly balanced, the arrangements convenient, and the rooms beautifully proportioned.

Externally, Castle Frazer consists of four plain storeys, with square corners, and fairly large openings corbelled out on the attic, the round tower rising to the height of seven storeys. If size and richness of detail are the criterion of a good building, then Castle Frazer outbids Crathes, Craigievar, and Midmar in importance, as it is certainly the largest and most elaborate building of its type in Scotland. Looking from the north-east into the open angle, the building presents a vertical appearance, owing to the grouping of the main block and towers, while it is finely bound together by the continuation of the horizontal corbel

MIDMAR. SKETCH FROM THE SOUTH-EAST.

\* A paper read before the Glasgow Architectural Association.

band, which throws itself up at the centre of the main block into a series of richly sculptured panels, with dormer over. The grouping of this feature with the two side dormers, and contrasting with the plain wall spaces, forms a fine primary motive to the entrance front. In the angle a circular turret rises from the ground and finished with a cone roof. The angle-turrets, while rising rather abruptly from the angles, are well proportioned to the size of the gable, which, in this case, is not so much lost as at Craigievar, while the turrets read fairly well with the chimney-head to form a complete gable. The round-tower, from this view, has a very bad connection to the end gable of the main block, and were it not for the presence of the later two-storey additions, would look detached.

One of the finest features of Castle Frazer is the long horizontal line of the main block towards the south, with its rich corbel course and row of fine dormers. This is almost similar to Killochan Castle, Ayrshire, which, although plain, has not that competition between the main rock and the round tower, which, in Castle Frazer, is so defective from this view. The round-tower, unlike Midmar, is furnished with a finely detailed Renaissance ballustrade, and the corbel course is carried right round the tower and continued round the house, although it would have been better left out here, while a beautiful detailed turret with arcaded openings at the top rises from the angle, similar to Midmar, but not nearly so finely connected to the round-tower, and finished with a fine ogee roof and weathercock vane.

The dormers are finely enriched and varied in detail, but the repetition of the round turrets appears a little monotonous after having seen the fine effect at Crathes, Craigievar, and Midmar of the combination of the square gable with this form. The sky-line is very good, and, while sufficiently varied, is not so pronounced as to take away from the simplicity of mass of the whole group. On leaving Castle Frazer, the student will again experience something like that feeling he had on leaving Crathes, with this difference, that he will understand why. The effect produced by Castle Frazer, while very grand and elegant, pertains more to the cast-iron or mechanical type of grandeur. From Castle Frazer the distance to Kemnay Station is only a mile or two. Kemnay is a nice little

MIDMAR. FROM THE NORTH-WEST.

village on the Don side, which boasts of some good houses, and is famous for its granite quarries. From Kemnay the railway takes you

down to Kintore, where you join the main line from Aberdeen to the north.

It will now be necessary to compare at some length the various characteristics of the buildings I have just described, and to find out the causes that go to make them superior to the majority of the buildings of their time. To do this it will be necessary to prefer one building from the others for its general superiority, and to praise the features of one building at the expense of another. From this you may lose your good impression of these buildings, but things are only great by comparison, and as I think Crathes infinitely superior to either Craigievar, Midmar, or Castle Frazer, so I consider these houses greatly superior to most of the other houses of their type throughout Scotland as far as I have seen them.

Making an instance of some of our Western ones, take Auchans, Rowallan, or Newark, and they are not to be compared to the houses of the Dee and Don, and even Maybole and Killochan, buildings which approach the same type, are not equal to them in design, grandeur of conception, simplicity of mass, and general elegance of detail.

A building cannot be said to be fine unless it is well designed. When a man has an idea to express, if simply and emphatically spoken, it will always remain dignified. And yet a thought may consist of numerous subsidiary thoughts, and may be expressed in fine language. But it is only the great mind that, having conceived a central idea, can hedge it round with a network of subsidiary ideas, all tending to prove the main idea, and, withal, clothed in the most beautiful expression.

The reason why the Architecture of the present day is so inferior to that of the Renaissance is not because of its want of beauty, but because of its want of a central motive, or because its central motive is lost

CASTLE FRAZER FROM THE NORTH.

CASTLE FRASER FROM THE SOUTH.

through the improper relation of the subsidiary motives, that is to say, comparatively speaking, there is no unity of idea in modern work, which is as much as saying there is no design. Now a building which is not designed has no right to exist, and to be designed it must have dignity and beauty. A building, however beautiful, if it has not dignity, is merely a pretty toy, whereas a dignified building may not necessarily be beautiful to be fine. Dignity has to do with scale, but has nothing to do with size. The smallest cottage may be dignified. Now the elements of dignity in a building are found in the unity of the main mass, subordination and proper relation of the features. Thus, a house to be well-designed must have a central purpose, an idea—it is a place to live in, but it is not two places to live in, but primarily a house. Now this house may have a large hall, which pronounces the main block; it may have a staircase tower, and it may have a drawing-room which pronounces the drawing-room block—neither of these is the house, but the three combined are the house. The staircase tower is first of all a part of the house, and then a staircase tower; and so with the drawing-room tower, and when they become more or less than that they are badly designed. In the same way a gable is a part of a house first and a gable afterwards. It may consist of two angle-turrets and a crow-stepped skew, but if the angle-turrets are so pronounced as to make the gable read two angle-turrets and a gable in place of a gable and two angle-turrets, it is badly designed; in the same way if a house is designed in a landscape so that you cannot see the landscape for looking at the house, then the house is badly designed, and appeals to you like an egotistic man in a company. It is this unity of mass and proper relation of parts that make Crathes so superior to Craigievar, Midmar, and Castle Frazer. If you compare the plans of these houses, you

will find that Frazer is a great deal larger than Crathes, and I am convinced that Crathes creates a much larger impression on you, although in the perspective it appears much smaller. I have often noticed that the size of a building in reality is inversely in relation to its size on a drawing.

The primary reason why Crathes possesses this unity of mass is the peculiar arrangement of the staircase, which I have already said came out flush with the front gable. If you had lived in the sixteenth century you could never have mistaken this for anything but the staircase, and yet it remains part of the house; again you would imagine that because of the connection of the staircase the drawing-room block would appear detached; but this is not so, as, because of the increased size of the main block, it takes its proper relation, and never competes with the main block, while it is sufficiently pronounced to appear an important part of the house. Now, in connection with the first point, at Craigievar, looking from the south-west, the staircase is so prominent and withal emphasized in the roof-line by the Renaissance parapet that it cuts the building into three parts, between which there is equal competition for importance, and, although this tends to increase the height of the building, it takes from it size. Again, in connection with the second point, although at Castle Frazer the main block from the S.W. is never lost sight of, the round drawing-room tower is so pronounced and so little connected to the house that, apart from its beauty as a feature, it does not read with it as it does in Crathes. In Midmar, however, this same round tower is so large that the house is subsidiary to it, and there is never any competition as to which is the most important, the house nestling closely by into the side of the tower. The rounded corners, too, at Crathes and Craigievar, although seemingly a small matter, help to bind the

houses together and softly unite the side in light to the side in shadow.

Regarding the proper relation of features in these houses. At Crathes the staircase and main gables are so well connected by the parapet, the turrets are so gradually connected to the angles, the gables are so much more important than the turrets, and the roof line of the turrets and dormers so squat and little pronounced against the sky-line, that the main idea is never lost, and every feature lends to the picturesque harmony of the whole. Again, the corbel course is not continued round the house, but is level throughout at the turrets, and thus

## CASTLE FRASER

pops out and hides itself again, playing a sort of hide-and-seek round the house which gives the subtle effect to Crathes and represents that dramatic concentration of detail I have already referred to.

In Craigievar the effect is quite the reverse. The features keep dancing round the roof line in a continued state of unrest, and as if competing in a friendly way for your notice, while the continued corbel course, combined with the want of grip of the ground, gives the building a top-heavy appearance. This continued corbel course in Craigievar and Castle

Fraser is in my opinion a mistake. It seems to me that one of the first principles of design is, if you have an idea emphasize it. Now, the idea of Craigievar is verticality, and therefore no horizontal line should be stronger than the vertical line. In the south-front Fraser again, where the idea is horizontal, it is very pleasing, but is utterly out of place in the gables. The features of Midmar and Castle Fraser are fairly well adjusted, and perhaps the only serious defect in Castle Fraser is the connection of the little angle turret over the round tower. This you might not observe had you not already seen the most beautiful and appropriate connection of the similar tower and turret at Midmar. In Midmar the two surfaces of the turret and tower die flush into each other over a flat arch, and again the turret is carried flush into the hall block over a corbel. The effect of this is to add to the already gigantic size of the round tower, and to connect it and the turret to the main block, thus carrying out the principle of Design which I have already tried to explain. If I were asked in a word to give my impression of these houses, I would say that Crathes combines dignity with beauty of detail, Castle Fraser beauty of detail with dignity, Midmar dignity without beauty of detail, and Craigievar beauty of detail without dignity.

My impression of detail is that it consists of two distinct types. The one being a higher form of detail than the other lives longer and grows on you, the other is as pleasing for the moment. The one is the general harmony of the detail to the whole building, the other is the harmony of distributed detail over the whole—the one is the general harmonic feeling of the Colosseum at Rome, the other the contrasted harmony of the Parthenon at Athens; the one is the general harmony of the perpendicular Gothic, the other the contrasted harmony of the Early English; the one is the general harmony of Midmar, the other the dramatic distribution of ornament on Crathes; the one I call simple harmony, the other compound harmony.

The detail of Castle Fraser and Crathes is of this contrasted harmonic type, and the fine concentration of ornament above the entrance at Fraser Castle, combined with the rich elaboration of the corbelling and dormers in contrast to the plain wall surfaces, produce a lasting impression on the student which is somewhat spoiled, in this case, by its formality. At Crathes, however, the detail is charming; in fact all over Crathes you seem to feel the Artist. The corbellings are like the building itself. While retaining general unity of mass, they are cut up into parts which are again redistributed in the most subtle manner, each part being subordinate to its superior, while they are bound together at top and bottom by strong bands, enriched by the projecting gargoyles, and then dropped down the angle a bit and finished into the round with a simple corbel. The dormers, too, are enriched by finials, which, while they enrich the outline, never lose their effect of being single stones set on end, and are moulded in a peculiar, sturdy fashion which feels native to the Artist and Scotch in its essence, and they are as subtle to draw as they are appropriate to the building.

It may be asked, Why do we study these old buildings? Do we intend to introduce a new Scotch Renaissance? If it were so, I should be the last to study them. My impression of revivals is that they are retrograde, that each revival throws back the progress of Architecture for the period of its existence, and that the great Renaissance of the sixteenth century was only excusable on the grounds that, the world having gone so far astray, it was necessary to break with the present, go back for ten centuries, and begin over again.

Nature teaches us certain principles of Design such as harmony, proportion, symmetry, &c., but nature is difficult to read, and by studying good buildings we may see these principles in stone and lime. It is thus that the Houses of the Dees and Dons should be studied, not to copy their forms blindly, but by their defects as well as their virtues to understand the principles that govern their forms.

## THE ARCHITECT AND THE PUBLIC.\*

By MR. W. H. BIDLAKE.

THE public was not inherently or intuitively antagonist to the Architect, or the Architect to the public. Some assumed that this state did exist, but, on the contrary, each existed for mutual help. "I must live and be sheltered; this want you must supply, and you must make my shelter beautiful for me. For this I will assist you in living." What arrangement could be more just and harmonious? Quite true. And yet the working of the arrangement could be more just and harmonious. Then came the question, how? That was the subject of the present paper. Architectural society was divided into two groups—clients and non-clients. The former was a small minority, though every taxpayer and ratepayer was a client where State and municipal buildings were concerned. Then he took an interest in the matter, and saw, as far as he could, not only that the money was wisely expended, but that Architectural results were obtained which would gratify his citizen pride. But the unwelcome fact must be faced at the outset—the British public was profoundly indifferent to Architectural matters. Some might say "no." The citizen did, perhaps, arouse himself from his wonted lethargy occasionally, and vehemently denounce the modern Architect and all his works, and it was a credit, therefore, that in these days so much good Architecture was done. At Florence in the days of the Renaissance the keen interest taken in Architecture invigorated the air and stimulated men to aspire to works which would claim public praise and public gratitude. When the public heart was touched, then was there an outburst of music and song and grand and exquisite creations of Art. There was such a burst, when, in the days of the Renaissance, men threw off the superstition and tyranny of the Church which had held them in slavery. Easy commercial prosperity made men content with conventional commonplaces. It did not set them longing. Life ran smoothly, and its daily currents did not disturb their emotions, and so in these days they had to face public apathy. An appreciative public would stimulate an Architect to produce his best, to produce better Art, for all his faculties would be awakened. Public praise was all very well, but what was the praise of ignorance? Public appreciation, to have any weight and to be capable of influencing the best men, must be critical and founded on knowledge and good taste. This led them to consider the great fact that the British public was profoundly ignorant in Architectural matters. How could it be otherwise? Indifference produced ignorance, and ignorance indifference. People did not even know what Architecture consisted of! Some regarded it as Archaeology as applied to modern buildings. The public idea of Architecture was that of ornamenting buildings. Here was a barn or factory: cover it with sufficient ornament and it became Architecture. The ornament might be misplaced—before it was an ugly building, now it was a beautiful one. Such a view might be pardoned in an ignorant man, but it was, alas, a view held by many men of education, men who had been taught to appreciate music and good literature, but who altogether

### FAILED TO APPRECIATE ARCHITECTURE.

If they saw a building in plain mass they called it unarchitectural. No doubt there was a winning grace in modesty theoretically, but the Englishman liked to see a man push himself to the front, and he also liked to see the same thing carried out in buildings. This was much to be deplored, because it was responsible for a certain class of building which was vulgarising whole districts—for it was undeniable that there were Architects who were prepared to sacrifice whatever principle they possessed on the altar of popular taste. Another popular fallacy was that the planning and design of buildings were two separate processes, and general ignorance also existed as to the right

treatment of building material. The public did not even know that there was a right and wrong way in dealing with building material. The effect of this wide ignorance was that Architects were deprived of public opinion and approbation. To the public the Architect was a luxury, and being unable to criticise him and his work, it was at his mercy. The Architect told his client what was the fashion, and he (the client) paid heavily for being made uncomfortable until his lease—or his life—ran out. But why should this ignorance of Architecture exist? They had been taught music; they knew English history as a series of sanguinary conflicts between England and France; but no one instructed the public to read for itself the history of our forefathers, written in the walls of the Parish Church. Was it not surprising that Architecture did not form the least part of the school curriculum? Even in Schools of Art, though building was taught, the subject of Architectural Design was conspicuous by its absence. A man ought to be considered as lacking in his education as an English gentleman if he

### KNEW NOTHING OF ARCHITECTURE.

If Architects would bring the subject before the public and assist in the establishment of lectures, scholarships, &c., and do everything possible to excite the interest of their neighbours, much might be done to claim public recognition for Architecture, and though it would not perhaps lead to the thorough purification of the Architectural taste, it would assuredly tend in that direction. It was vastly more important that our streets should be lined with beautiful buildings than that we should listen to music in the park for a few hours now and again in the season. One of the most important departments of municipal government was that dealing with new buildings, but here Architects had neglected the opportunities of their Art. And, indifferent as the average Englishman was towards Architecture, when his interest was excited he sought to know what was good and what he ought to admire, and if authoritatively told to do so, he would admire the really beautiful. He must, however, be taken in hand first; he would not undertake the initiative, and it was by Architects that he must expect to be led. He was unimaginative and commercial. When he built he liked to see his money's worth; let him have plenty of it and he would rest undisturbed by questions of refinement and quality. But if the beauties of proportion, of light and shade, and other evidences of refined taste were pointed out to him, he was not so insensible but that he would learn to appreciate them. Who would point them out to him? Not Architects. They were too busy with their individual practices. The public did not regard the Architect as a practical man—that term applied to the builder; the Architect was a luxury, and his services could be dispensed with in these days when one could rely upon the authorities to see that one's drains were in a good state, and everything else in satisfactory order. It was a general belief that when a plan and an estimate were obtained, the work of the Architect ceased. It came as a surprise to most clients, who were not usually experienced in building matters, to see the

### NUMBER OF DRAWINGS REQUIRED

in the erection of their buildings. "Well," said the client, "I did not know you had to work so hard for your money. I should not think the five per cent. pays." Five per cent. was considered a high commission, and Architects were often asked to take less; certainly to exceed it was a difficult matter, even when engaged with the most elaborate fittings or Church decorations. When the Church Architect, asked to accept a lower commission, demurred, he was reminded that a donation to the organ fund would be most acceptable, or was given the opportunity of providing a silver trowel for the foundation-stone laying, and the result of this sort of thing was that the Architect whose practice was principally confined to religious work was subjected almost to a perpetual fine. Not infrequently the Committee acted very shabbily towards the Architect. On the Committee there

\* Report of paper read at a meeting of the Architectural Association on Friday, the 19th inst.

was at least one member who had had some experience of building, and he came very prominently forward with his assistance. The private client, however, had no one to help him, and it often became necessary to provide many alternative sketches before the clients came to the conclusion that he would not build, and was much surprised, and exclaimed, "Why, I didn't select any of those sketches you sent me," when he received a bill. Many a patient Architect had laid his most exquisite ideas before unrefined and uneducated wealth, to have them ruthlessly set aside with a sigh and a remark about "beauty and the beast." Another point to which he wished to refer was that of public competitions. This method had reached alarming prevalence owing to the folly of Architects in administering to it. The system appeared to him a very mean way of getting £100 worth of work for £10. He wondered if painters would in time be asked to compete for painting portraits. Public competitions, provided an assessor was appointed, seemed right and fair, but the first premium was a delusion and a snare. The Architect competed on the understanding that if he was placed first he would be employed in erecting the building, for the paltry amount of the first premium was by no means adequate remuneration for his labours. Competition drawing could not serve as working drawings. The work had to be done again, and it was right that he should receive some preliminary compensation. But there were others who had performed the same labour. Should not these receive compensation? Would it not be more satisfactory to divide the amount of premiums, including, of course, the first, in equal honorariums to all those invited to compete? Furthermore, would it not be better to limit the number of competitors, and thus avoid a large expenditure of labour and bad language called forth by the recent competition at Exeter? No competition should have more than twenty competitors, and in the case of a competitor submitting a design of great excellence, but omitting one condition, it was unjust towards that competitor and wrong towards the public to deprive it of a notable building on such trivial grounds. The right course would be to erect the building, the money to be handed over to the first competitor who had observed the conditions. While the public knew little of the extent and nature of the Architects' work, the attitude of the public towards the Architect was one of distrust. This was the underlying sentiment, engendered by prejudice, hearsay, and experience. They might feel inclined to deny this—they certainly would like to deny it—but was it not true? If it was true, what were the causes? There might be many, but he believed there were two chief ones. Distrust was if the Architect was included in the general distrust of the word "artistic," and particular distrust rested on financial grounds. As a red rag to the British public was the word "artistic." Ask the Britisher himself, and he would say that if he must go to an Architect, he would go to a practical man and not to one of "those artistic chaps." Architects were to blame for this conception of the word "artistic." The Britisher had shrewd common sense, and his idea of a home was summed up in the word comfort; he did not think it desirable to darken the rooms in order that the exterior of the house might be in some particular style of Architecture. Undoubtedly most Architects set themselves sincerely to interpret their client's wishes, but there were those who sought their own

#### REPUTATION AT THEIR CLIENTS' EXPENSE,

compelling him against his will to accept a certain design or feature of a design. It was the duty of the Architect to respect his client's wishes if they were reasonable and wise, and if not to save him from himself as it were, especially so if a client was uneducated, or a man possessed of some particular fad of which he would probably tire. If the Architect acquiesced quietly, the client would turn upon him and say: "It is true I wanted such and such, but I don't know much of the business and did not see the effect of it. I came to you

as a specialist, and was quite open to argument." In public work the case was different. The committee stood for the public, and the individual opinion of any member ought not to over-ride that of the Architect whom they presumed better understood the question. The Architect, convinced of the wisdom of his views, should then maintain his position, not dogmatically maintain it, but winning the members of the committee to his side. A further question remained to be considered—a question of the greatest importance—that of the distrust by the public of the Architect on financial grounds. It was often said that if they went to an Architect they never knew where the expense would end, and there was some truth in the statement. The client lays his wants before the Architect and tells him how much he is prepared to spend. Of course, the sum is inadequate, and the Architect tells him so. "Not at all," he says, and the design is submitted, which he is told can be carried out for the sum named. All goes well until the tender is opened, and then came the disillusionment of the client. The lowest tender is half as much again, or perhaps it is double. This misleading of the client as to cost was of frequent occurrence, and how much more confidence he (the client) could place in the Architect if the latter told him at once what his building would cost! He would doubt the Architect, however, say that Mr. So-and-So had had a similar building put up for a like amount, and he would therefore consult another Architect who would mislead him, so that the straightforward craftsman ran the danger of losing his clients. In the end, however, he would be the gainer, for he would acquire the rare reputation of being an Architect who could be trusted, and would be able to build up a practice on the soundest basis. And turning again to public competitions, each competitor was required to give an estimate of cost; some conscientiously endeavoured to carry out instructions in spirit and letter, and had to cripple their design in consequence. Others made an elaborate drawing of an elaborate building, arranged on the principle of cost being divided according to the cubic measurements of the building, and by such an arrangement they found to their satisfaction that it could be done for exactly the sum to be expended. This proportion, when carefully described, was enough to throw a committee off its guard, and when the tenders were opened there was a growl by the committee, and expressions of disgust by brother competitors, disgust which deepened when the bill of extras was sent in. The Architect could not prevent extras altogether, but he could do much to lessen the amount, and ought to keep a client inclined to order extras informed as to how the bill was mounting up, so that there could be no after surprise. The reputation of being able to build without extras was so unique and priceless to the Architect that it was worth some trouble to win. It would increase his practice more than any thing else. And coming to the last point in the paper, the public had heard from time to time some

#### TALK OF ILLICIT COMMISSIONS

as associated with the practice of Architecture. Lately it had even been subject for discussion in the Press, though in spite of that fact there might be no truth in the statement, for the public was naturally suspicious. It was stated that commissions had been given to Architects by tradesmen. They believed this was true, that some members of the Institute had received these commissions. They might even know of some specific case, but were they going to report these members? They talked much about purifying the profession, but they would not venture so far as to report such a case. They must be left to their consciences, and at the same time do all in their power to prevent the commissions by personal influence and by making known the names of those firms offering commissions. But it was not only from tradesmen that Architects received commissions. It was the custom in many cases for the quantity Surveyor to take out the Architect's quantities, and the latter would then

ask, "What is your percentage, and out of that how much do you allow the Architect?" In other words, the Architect, relieved of the trouble of taking out quantities, yet received a certain percentage. The Quantity Surveyor was, to a large extent, at the mercy of the Architect. He received his work from the Architect, and if the Quantity Surveyor objected to the Architect receiving a commission, it might be that the Architect would go elsewhere and give his work to the man from whom he could obtain a commission. Furthermore, the builder was equally at the Architect's mercy, for it was from the Architect that the builder received invitations to tender, and just in the same way the builder was also, though to a less extent, at the mercy of the Quantity Surveyor, for it was clear that the latter, when employed to settle up the work, could make either more or less for the builder who was engaged upon it. Now the Quantity Surveyor was not employed directly by the client, and in most cases the client did not even know of his existence—he did not even know that it was necessary for quantities to be taken out—and the result of it was that there was a closed ring between the Architect, Quantity Surveyor, and the builder, and it was to the interests of the three who worked within the ring to study each other's interest. There was no doubt, however, that the Architect's profession was as pure as any other profession, and the majority of Architects would scorn to take advantage of this closed ring. But was it not an extremely unsatisfactory state of things that such possibilities existed, because when they saw conditions which led to fraud they could rely as an absolute certainty upon fraud being perpetrated, and he was therefore anxious to lay particular stress upon this question. The essential point was this: Is the Architect justified in receiving commissions from the Quantity Surveyor? While many Architects scorned to receive commissions from tradesmen, there were many Architects who received commissions from tradesmen. Where was the difference? The only difference was that, in the case of the Quantity Surveyor it was customary, and with any practice, however immoral, which could be regarded as an immemorial custom, it was not difficult to reconcile one's conscience to it. If then, the receiving of commissions from Quantity Surveyors was as bad as receiving commissions from tradesmen, how was it that the one was so often condemned while the other was seldom heard of? Because, as he had said before, the Architect knew perfectly well that the Quantity Surveyor was dependant upon him and would not be likely to divulge matters. It seemed to him that it ought to be one of the conditions of membership of the Institute or the Association, not to receive commissions from Quantity Surveyors or from any tradesman. The Architect's defence was this: He receives five per cent. for making the drawings and superintending the work. When the quantities are taken out more work is entailed, and the Architect thought he should be remunerated for it. Let him be remunerated for it, but let him be

#### REMUNERATED DIRECT FROM THE CLIENT

and not from the Quantity Surveyor. The Architect should not receive a single farthing from any other source than directly from the client, and it seemed to him that that was a right and proper condition of membership in an Architectural body. If the public only knew of the closed ring of which he had spoken and the possibilities of fraud it opened out, he was sure that the distrust of the profession would increase, and perhaps the most direct way of putting the Architect out of temptation was to let in full public knowledge. If they could bring about the purification of the profession in this and other respects they would find that the Architect would become much more entrusted by the public, and the public would be prepared to receive from the Architects their ideas in matters of taste as well as construction, and, at the same time, would trust them in matters of finance.—Mr. Osborne Smith, in moving the usual vote of thanks, thought Mr. Bidlake had laid bare

certain defects to which he had often thought attention ought to be called. He was prepared to endorse nearly all the author of the paper had said, and his personal experience had so convinced him of the ignorance of the public in matters architectural, that he took every opportunity of deluging clients with drawings. They ought to show the public the difference between the house put up by the speculating builder and one put up by an Architect. He did not agree with Mr. Bidlake as to the monetary relations between the Architect and the Quantity Surveyor; "the half-percentors" were dying out, and those at present in existence were chiefly to be found in the provinces. He did not think first-class or even second-class Surveyors would lend themselves to such a thing. And as to the Architect receiving information from the Surveyor—well, if the former prepared his drawings properly, he did not want much information; but when he had no specification beyond a few notes on the back of a foolscap, it was necessary for the Quantity Surveyor to keep the Architect correct on many points. This was an evil which he had heard bitterly complained of by some of the best builders in London. The chief fault that the speaker had to find with the modern draughtsman was that he did not start in the proper way to make his drawings. Some draughtsmen had developed the habit of making elevations without a plan—a most unintelligible way both to the builder and the Quantity Surveyor. They must thoroughly develop their ideas before they called in the Quantity Surveyor, and not seek to rush their jobs through on the chance of things coming right in the end. The only proper way to begin was to make everything clear to the client at the outset, especially the position of the Quantity Surveyor so that he might know that the Architect did not take out his quantities, but that someone else had to be employed for whom he (the client) would have to pay. If this was done, he agreed that much of the public distrust towards the Architect would disappear.—Mr. B. F. Fletcher had pleasure in seconding the vote of thanks, because he disagreed with him on nearly every point. As to the public ignorance in the matter of Architecture—well, what could they expect? Architecture was one of the most difficult, one of the most progressive—or it should be—of Arts, and it required a life-time to acquire a grasp of the subject; yet people were crying out as to the public ignorance! If they considered the ignorance of Architects on Architecture, they would see that there was room for improvement even there; and the only way to view the subject was in the same light as they would view medicine or law. It was simply a little knowledge on the part of the public on the subject of Architecture, which had brought all the trouble about, for many of the revivals was directly owing to the action of Antiquaries. If there had been no Parker they might have gone merrily along the high road of Architecture, bringing out new forms and making fresh developments which Antiquaries had prevented. As to proportion, Architects knew very little about it themselves, and it was impossible for them to instruct the general public in its subtleties; it was not to be taught by rule of thumb, but was to be learnt by

#### ARTISTIC QUALIFICATIONS

acquired as the result of many years of study. Mr. Bidlake had gone very strongly on the poor British public for its ignorance on the subject of the right use of material, but here again a difficult and very laborious study was entailed, and they could not expect an untrained public to know much on the matter. It was a case of "a little knowledge being a dangerous thing," and it seemed to him that the more the public knew up to a certain extent of Architecture, the worse it would be for the Architect. Knowledge of forms by the public was not reasoned out, and all this talk as to the public taking an interest in the subject did not, he thought, really serve any useful purpose.—Mr. H. W. Pratt was unaware that the Quantity Surveyor, the builder, and the Architect, entered so much

into a "closed ring" as Mr. Bidlake would lead them to believe, and certainly it was not practised to any large extent in London. Unfortunately it was because of the Surveyor's commission being paid in the way it was, that they were enabled to deal with such a free hand. The work of making out the specification was now-a-days frequently placed in the hands of the Surveyor, and to this he strongly objected to, not only because such a practice meant putting upon the Surveyor work which to him had ascertain value, but because the compiling of the specification was a matter which essentially came within the Architect's province. He was sorry that Mr. Bidlake had raised the question of the "closed ring" so prominently in his paper, because it would be

#### A REVELATION TO THE PUBLIC.

It was a question to be discussed by Architects themselves, but not in public. He was not saying that the matter ought to be hushed up, but Architects could arrive at a satisfactory understanding without undesirable publicity. The speaker acquiesced as to the public ignorance in Architectural matters, and referred to a recent competition in which the designs were asked for on the quarter scale—elevations and everything. Of course, this was utterly absurd, and he could only account for it by believing that a builder was included among the members of the committee. Architects, he thought, ought to seek to acquire greater business capacity, and they simply had themselves to thank for the distrust in which they were held on financial grounds.—Mr. E. W. Mountford thought that Mr. Bidlake had brought into rather undue prominence things which existed, but not to any large extent. They knew that the illicit commissions he had spoken of were paid, but neither in London or the provinces was it a matter of common custom. He did not agree with the last speaker as to the importance of the specification for it was by the bill of quantities they were guided, and if the Architects, therefore, supplied plenty of detail, the specification sank into comparative insignificance.—Mr. H. B. Cresswell continued the debate, remarking that he thought Mr. Bidlake had started from the wrong standpoint. He ought to have commenced by saying, "The public is an ass," and have gone on to show that the public really was not so bad as it was made out.—In winding up the discussion after the vote of thanks had been carried, the Chairman (Mr. Beresford Pite) said they had to recognise one fact—that Architects were only paid for design. Their client never contemplated that they would put sufficient time into their work to devolve a really artistic design. He did not understand that such a contract was implied, and he certainly would be very much surprised if asked to pay for the Architect's time. They had, therefore, to regard themselves as men of business, and under these circumstances the temptation to a young Architect to fling artistic impulse into his plans was very great, and only those men who understood that the Architect was a self-denying, hard-working philanthropist could really do good work. What did a client care how much they rubbed out a detail? They might do a whole set of drawings over again in order to get one idea over which they were enthusiastic embodied in actual bricks and mortar. Of this the client knew nothing, nor did he care a brass farthing, and therefore he did not think they ought to ask the client to pay for time. Had it never occurred to them that they ought to pay the client for erecting, on a piece of ground which belonged to him, their own dream of the Renaissance? In view of the fact that

#### THEY WERE DREAMERS AND IDEALISTS,

and had opportunities of carrying out their dreams at the expense of the public, they ought to modify their idea of the public. The amount of work imposed upon the Architect for his 5 per cent. was, however, getting unduly onerous. Considering what often devolved upon a London Architect in the way of preliminary surveys, negotiations with the County Council, and so on, and remembering that a client would feel very much aggrieved if he

received a fee account at the end of his commission account, they undoubtedly had cause for complaint. Since the practice in London of an Architect taking out quantities of his own work had been forbidden, he had been deprived of a very definite source of profit, and he could not help thinking that many of the difficulties under which they laboured would be dissolved if the Architect was able to take out his quantities as of yore, and as they still do in the provinces. He did not think the client or the builder would run more risk of suffering; he was certain the Architect would not be more expensive to the client, and the facilities for building would be much greater than at present. The speaker proceeded to denounce the practice of taking out excessive quantities adopted by some Surveyors as an absurd state of things, and it seemed to him that the only way to bring it to an end was for the Architect to take out the quantities. He had never known of a case of an Architect receiving a commission from a Quantity Surveyor, though he had heard of such cases. Many clients did not regard the taking of commissions from tradesmen as an obliquity, but, whatever the client's feelings were, it was wrong, and Architects had no business to receive such commissions. And as to the competition system, he thought that the adjudication of competitions as carried on at the present time was very mischievous and unsatisfactory, and the fact that large sums of money were paid to assessors to assist in arriving at these unsatisfactory results did not improve matters. In big competitions the adjudication might, he thought, be left in the hands of the competitors themselves, for they were best qualified to judge the drawings. But failing the acceptance of this view, he would like the Institute to consent to act as adjudicators in any competition whatever without any charge, simply and solely in the interests of the profession. A Council of Honour of the Institute would soon make its influence felt, and the public would learn that they could always get the best opinion without any cost whatever, and the gain to the profession would be very great indeed.—In replying, Mr. Bidlake said he thought the standard of public taste could be raised by showing the public beautiful buildings with fine proportions, which they would learn to know and admire. As to the monetary relations between the Architect, Quantity Surveyor, and the builder, he repeated that arrangements could be made as to sharing percentages. All the possibilities of fraud were there, and it was these possibilities which he denounced. He did not say Architects were guilty of it—he had far too much respect for the profession to say that for a moment—but so long as the possibilities existed it was unsatisfactory, and it was because he thought this was a slur on the profession that he had brought the subject forward.

Another attempt is to be made to improve the atmosphere on the underground railway. The President of the Board of Trade has appointed a committee "to inquire into the existing system of ventilation of tunnels on the Metropolitan Railway, and report whether any, and if so what, steps can be taken to add to its efficiency in the interests of the public."

The St. Pancras Vestry has decided to extend its electric mains to Park Village West, Regent's Park. Dr. Walter Smith recently stated on behalf of the Electricity Committee that that committee never recommended extensions unless there was a certainty of realising 20 per cent. profit on the outlay incurred. This profit had been derived hitherto in regard to the extensions effected.

Few probably know the amount which is annually expended in respect of our diplomatic and consular buildings abroad. It will be for the ensuing year about £24,400, and the money will be expended at different capitals or great towns all over the world. A melancholy interest attaches to an item of £800 which is included in this total. It is to be expended on cemeteries, £200 being in respect of the cemetery on Cathcart's Hill, in the Crimea, and £369 on that at the Bosphorus.

# ROYAL INSTITUTE OF BRITISH ARCHITECTS.

## THE GARDEN IN RELATION TO THE HOUSE.

DISCUSSION ON MR. H. E. MILNER'S PAPER.

(Continued from page 24.)

THE discussion which followed the reading of Mr. H. E. Milner's paper on "The Garden in relation to the House" at the last meeting of the R.I.B.A. was opened by the Hon. Alicia Amherst, who fully expressed her agreement with the facts and principles laid down in the paper, especially in that the garden ought to be laid out with due regard to the Architecture of the house. She was very glad to hear Mr. Milner make reference to Parkinson and his "outlandish" flowers. Certainly never were there so many "outlandish" flowers as at the present day. And just as in designing an Elizabethan house they adapted it to modern requirements, so in a modern garden these flowers ought to be taken into consideration. Mr. Milner had dropped suggestions which, if carried out, would, she thought, lead to the mutual benefit of both Architecture and Horticulture.—Mr. Aston Webb proposed a vote of thanks to Mr. Milner, and said it would be impossible to find a more delightful subject than gardening; it was a subject in which all Architects were closely interested. A beautiful garden was incomplete without the house, just the same as a modern house was incomplete without a beautiful garden, and it was therefore essential that the producers of the house and garden should work hand-in-hand from the very commencement. It seemed to him a most desirable thing that in building a house they should call in the gardener and discuss the way in which they proposed to lay out the house before they drew a single line on paper. This was a practice which, personally, he had found very helpful. The question as to whether the garden should be formal or otherwise was naturally a matter of interest to Architects, and not only in the present day, but it had been so from the time of Queen Elizabeth—they had taken an interest in the garden which surrounded their houses, and he could not help thinking that the word formal had been much overdone, and was misunderstood, not amongst Architects, but amongst their clients and the public generally. The formal garden they were striving for, and hoped to see adopted, was the formal garden of England, not the formal garden of Holland,—gardens such as that at Hampton Court or at Hatfield House, with high hedges and long walks, with wide and sloping lawns, pleasant to look upon. It had been sneeringly stated that this was a subject—the garden question—which Architects were now noticing more than hitherto, but as yet their idea of a garden was a small plot of ground surrounded by a high brick wall. Personally, he did not think Architects wanted to surround every garden with a square brick wall, though he was not at all sure that Mr. Milner even, had not the idea that they were desirous of doing something of the kind. They were certainly not afraid of a brick wall, but they also recognised the desirability of hedges. The principal things to be considered in dealing with a garden were the prospect, sheltering and shading and so on. Mr. Austin, in "The Garden which I Love," wrote, "Had I a garden it should lie all smiling in the sun," which reminded them that the garden should of course be on the sunny side of a hill, whilst the entrance to the house should be on the shady side. There ought to be some design about a garden; man's hand should be visible, and any attempt at naturalism would, he ventured to think, only lead to unsatisfactory results.—Mr. H. H. Statham seconded the vote of thanks.—Lieut.-Col. Lennox Prendergast said the subject of gardening was of greater interest to Architects than many people were inclined to think, because it had to do with the great question of beautifying English homes. The houses of England to-day were for the most part on high grounds, and this altered the whole method of dealing with the grounds. It involved

a complete change of principle. The grounds must fall away from the buildings, and the question was, How were they going to act? The builder would like everything taken out from the foundation, but that would not do, and a consultation with the landscape gardener as to the general way in which to deal with the material was desirable.—The Chairman closed the discussion with a few remarks, in which he said that he always understood that the landscape gardener looked upon himself as the master of the situation, and when called in to lay out a garden and grounds, did the work to his own satisfaction, and was then ready to recommend a man to build a house which would agree with what he had done. He considered there was a certain charm about what was called the formal garden. It was delightful to see this formality in cottage gardening, and it was brought into pleasant contrast in some of the wildest places in the country. Of course the formal garden of to-day was nothing compared with the garden of the Romans, from whom this formality came. They carried it to the very extreme, for they read of animal forms being cut upon the trees and so forth. The information Mr. Milner had given them was very useful, for few of them had not a house to build in the country occasionally.—Mr. Milner, in replying, said he thought the only rational way of treating the grounds of any place was to adapt their plan to the natural circumstances. It would be impossible in every district to form such a garden as that at Hampton Court; if the Hampton Court plan had been made for a hillside, the result would have been ridiculous. It was the business of the landscape gardener to form in his mind a picture of how the ground would look when the plan was carried out; and it was, as Mr. Webb had said, highly desirable that he should go hand-in-hand with the Architect.—The next meeting of the Institute will be held on March 1st, when the business will include the election of the Royal Gold Medalist for the current year.

## EXHIBITION OF OLD MINIATURES.

THE authorities of the Queen's Park Museum, Manchester, have secured for their twelfth winter exhibition, which opened a few days ago, a most attractive and important collection of old miniatures. For many years miniature painting has been neglected. The last great painter of the old school, Sir William Ross, died in 1860, and after his time the cheap photograph drove the expensive miniature out of the field. A few miniature painters have continued to practice the art in a debased style, and the wealthy enthusiasts have never ceased to collect examples of the old English school; but for the general public this delightful branch of Art was dead and forgotten. Of late, however, there has been a sudden change of fashion. It has been discovered at last that miniature portraits are preferable to photographs. Young artists, says the Manchester Guardian, have turned their attention to the subject. Two societies have sprung up—the Society of Miniaturists, founded in 1895, and the Society of Miniature Painters—and have held exhibitions in London. The Art magazines abound in articles on the new movement. In short, there is every sign of the revival of the miniature, and Manchester, thanks to the authorities of the Queen's Park Museum, is to have a share in promoting this worthy object. The present collection of 367 old miniatures, most of which were shown at the Grafton Gallery in London in November last, represents the Art as it flourished from the sixteenth to the early nineteenth century. It is not complete, for Holbein and the two Oliveres, Isaac and Peter his son, Samuel Cooper, the greatest of our miniature painters, and Flatman, his younger contemporary, are not represented at all, though the very solid and ably painted "Henry, Prince of Wales" (No. 512) is not unworthy of Isaac Oliver, the favourite Court painter of Elizabeth and James I. Still, the collection shows very fairly the growth of the art from the days of Nicholas Hilliard, who painted Mary, Queen of Scots (No. 502), and Lady Jane Grey (No. 519), to the age of

Cosway and his brilliant school. There is a capital example of John Hoskins, who died in 1664, in the "Thomas Hobbes," which is lent by the Duke of Devonshire. Laurence Crosse, the pupil of Cooper, is seen at his best in a delicious portrait of a gentleman who is supposed to have been a brother of the first Duke of Devonshire. Ozias Humphry, the clever contemporary of Cosway, is represented by a striking but somewhat hard miniature of the "Duchess of St. Albans," in a large red hat. But the work of the later eighteenth century, it must be confessed, takes precedence of all these. Cosway himself is particularly well represented by a long series of portraits of his noble patrons, most of which are perfectly preserved. A number of modern miniatures—187 in all—by the members of the Society of Miniaturists, are also included in the Exhibition. It must be confessed that it is rather painful to inspect them after spending an hour or two with Cosway and Russell, Engleheart, Pailton, and the rest of the old masters. The modern work is as yet too laboured, too weak in drawing, and too thin in colour to bear the inevitable comparison with the work of the past. However, several of these examples encourage the hope that the Art will revive.

## TECHNICAL EDUCATION IN LONDON.

IN the report of the Technical Education Board of the London County Council on the expenditure for the year 1897-8 it is stated that by March 31 the unexpended and unappropriated net balance of the sums hitherto allotted will probably be insignificant. The opening of new technical institutes in various parts of London, and the growth in the number and variety of workshop classes in the various trades will, with the ordinary expansion of the number of students, necessitate some increase of expenditure, whilst they are in hopes of being able, during the ensuing year, to fill some gaps which are still existing in some districts. The Board realises that the present rate of increase of the work cannot be indefinitely continued, but there is still much to be done, and the amount which should be set aside by the Council for the purposes of technical education for the year ending March 31, 1898, if the Board is to maintain its present work, will be £150,000. This amount is arrived at as follows:—Technical departments of polytechnics, £30,000; Shoreditch Municipal Technical School, Wandsworth and Norwood Technical Institutes, the (Mile End) Craft School, Herold's Institute, Camberwell Art School, Central School of Arts and Crafts, Bolt Court School, and other institutes in contemplation, £27,700; technical departments of public secondary day schools (including allowance for fees, books, &c., of the Board's scholars, £10,000), £23,000; higher education, £4,500; county scholarships, £29,175; teaching in art, science, and technology and manual instruction (including exhibitions in art, science, and technology, but excluding polytechnics, secondary schools, and special institutions for which the Board is mainly responsible), £19,900; domestic economy, £6,000; commercial subjects, £2,000; museums (chiefly art examples), £1,000; expenses of administration (including cost of advising and inspecting technical institutes, advertising their classes and the Board's scholarships), £7,200. For the year 1896-7 the Board's expenditure is estimated at £120,000, and the chief causes of the increase for 1897-8 are assigned to—(1) the establishment of additional classes for workmen in the polytechnic institutes; (2) the establishment of craft schools and technical institutes specially adapted to meet the requirements of London industries, some of these being wholly or chiefly under the Board's direction; (3) the development of the Board's scholarship system, which has now reached the limit of the original scheme. Owing to the development of technical schools and classes in artistic crafts it has been rendered impossible to distinguish between the teaching of technology and that of art, and in the present estimate the teaching of art, science, and technology in institutions, aided by the attendance grants, is grouped under one heading.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
February 24th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A CORRESPONDENT writes: "With your permission, I desire to call attention to the advertisement which appears from the Commissioners of the Borough of Enniskillen, inviting Architects to submit designs in competition for a new Town Hall. The proposed expenditure is £7500, and sums of £50, £20, and £10 are offered as 1st, 2nd, and 3rd prizes, with the condition that 'the successful plans and designs are to become the absolute property of the Commissioners, to adopt in whole or in part, as the Commissioners may deem desirable or necessary, without further payment to the successful competitors.' It is to this condition I take exception, as being a most insidious attempt on the part of a public body to obtain work of an exceptionally valuable description, and evade payment for it at its ordinary market price. As this is an open competition, the profession throughout Ireland, and not the profession alone, but every man in sympathy with it, are equally interested in the terms under which it is to be held. The uniform practice in all such cases is that the author of the selected design is entrusted with the carrying out of the work, receiving the usual fees, in which the amount of the first prize is merged. In this case the fees would amount to £375; and, as the work would possibly take a couple of years to execute, the remuneration, it must be admitted, is a moderate one, especially when it is remembered that it includes a large amount of necessary and subordinate work, all of which involve considerable office expenditure, and make a heavy deduction from the sum received."

THE Benchers of Gray's Inn have resolved to remove the disfiguring stucco from the exterior of their fine old hall and to restore it, as nearly as possible, to its state when originally erected. The work was so satisfactorily begun on Thursday last, that a successful completion is confidently anticipated. The hall, though not large, is one of the most interesting in London. Queen Elizabeth visited it often, and its finely carved oak screen and several of the dining tables were, according to a tradition of the Inn, a gift from her to the society. The members still solemnly drink on the grand night of each term "To the glorious, pious, and immortal memory of good Queen Bess." The accounts connected with the erection of the hall, written by Sir Gilbert G. Knight, the then treasurer, are still preserved in the library, and they show that the cost was £863.

PROFESSOR AITCHISON, writing on the subject of South Kensington Museum, says it is melancholy that the fine site should be left in the condition of a contractor's yard, with nothing but blank walls and sheds, instead of proclaiming by a fine building to London and the world that it is the entrance to a museum which contains the best collection of works of Art in Europe. The space now wasted is urgently wanted not only to display collections but to render them useful to students and the public. The Museum contains the finest col-

lection of Roman ornament there is in the kingdom, now, alas, unseen and useless; and there are, doubtless, other collections equally valuable that cannot be shown for want of space. The marvellous improvement of late in drawing and book illustrations is largely owing to the efforts of South Kensington, and so is the improvement in the designs of articles of use—humorously called Industrial Art, but which Michael Angelo and Benvenuto Cellini considered worthy of their skill. It is not size but perfection that characterizes works of Art, or we should have heard more of the Colossus of Rhodes and less of "the Scrapper." Our Artless generation is ignorant of the great popular lessons that are given by fine specimens of contemporary Painting, Sculpture, and Architecture; lessons which can be given by these alone; "contemporary" because the most learned have but a slight and superficial knowledge of the tendencies of other times, while ordinary persons have not the slightest notion of any other times but their own. Works done by their contemporaries must have some characteristics of the time they live in, and therefore more strongly appeal to their emotions. It is to be hoped that those who have the power may urge the Government to have the work, so urgently required, begun at once.

THE annual distribution of prizes to the members of the Art classes of the East London Technical College was held last Wednesday at the People's Palace, Mile End Road. Mr. J. R. Diggle, of the London School Board, presided, and said that there were no fewer than 400 pupils in the classes. The prizes were distributed by Mr. Orchardson. The chief prize-winners were Ernest Smith, who had won a bronze medal in the South Kensington national competition, Henry Bulmer, Alfred White, and Ethel Lind, each of whom had won London County Council scholarships of £20 a year, and Cecil Duffield and Alfred Walker, who had gained scholarships of £5 each. Mr. Orchardson congratulated the pupils on the progress they had achieved. The progress of the young was always a matter of interest to those who were veterans, for they knew that the young people had to carry on the traditions of British Art. They came to Art classes to learn to see. Many people did not know what seeing was. The training of the eye, and the brain behind it, was the chief work that an Art class achieved. They did their drawings and then were not satisfied with the result. Why was that? Because they had learned the chief lesson that an Artist ought to learn. They had found that until both eye and brain were fully educated they could not see properly. The beginning of Art was seeing with a purpose. And when this was once learnt it lay with the pupils how far they could carry out their lessons; it lay with them to reproduce that which their brain conceived. Art was not alone the mere seeing of Nature, it was seeing her with a purpose, and a purpose in which the Artist's own individuality had the chief concern. A photograph was not Art, because there was no personality behind it. It was a mere mirror, a reflection. The Artist put the reflection of his own soul in the picture he painted or the decorative design that he conceived.

UNDER the superintendence of Messrs. Wimperis and East, the upper part of 179, Bond Street, has been almost entirely rebuilt to make suitable premises for Messrs. Lafayette, the well known photographers of Dublin. An additional floor has been erected, which forms a fine studio, with plenty of light, and we understand special machinery has been put in for rarifying the atmosphere upon an entirely new system, which has been found to work with much success. We have not had an opportunity yet of seeing the working of this arrangement. The electric light installation is very complete, and has been carried out by Messrs. Strode and Company.

THE Royal Scottish Academy's seventy-first exhibition opened on February 19th. This year 727 works of Art have been accepted, as against

656 last year, and more than 620 were rejected. One of the features of the exhibition is a display of works by the late Sir John Millais, who was an honorary member of the Royal Scottish Academy. In all seven pictures have been secured, which illustrates the early, middle, and late periods of Millais' artistic career. These include the "Ophelia," the "Rosalind and Celia," and the "portrait of Mr. Gladstone." Of the work of the late Mr. Otto Leyde, another Academician recently deceased, several examples are upon the walls. The exhibition also includes a portrait painted last year by Mr. Orchardson of Mr. Henry Balfour Fergusson, Dundee. Sir George Reid, President of the Scottish Academy, contributes two portraits. Other portraits which may be specially mentioned are those of Mrs. MacLehose and Master Roy Garraway, by Mr. James Guthrie, one of the younger Scottish painters; and of the Misses M'Laren, by Mr. John Lavery. In the department of landscapes the best works exhibited are by Mr. John Smart, Mr. J. L. Wingate, Mr. A. K. Brown, Mr. James Paterson, Mr. G. W. Johnstone, Mr. W. D. M'Kay, Mr. J. Campbell Nobee, and Mr. W. S. M'George. The water-colour room is well furnished with characteristic work from such well-known painters as Mr. R. B. Nesbit, Mr. Henry Kerr, Mr. Tom Scott, Mr. J. M. Hay, and Mr. Skeoch Cumming.

FOR some weeks past the condition of the spire of St. Augustine's Church, Hagley-road, Birmingham, has occasioned anxiety, inasmuch as some of the masonry had become dislodged and fallen to the ground, and with the aid of a powerful field-glass, a large crack could be descried high up, beyond the range of the naked eye. Mr. F. B. Osborn, Architect, whose services had already been retained with a view to the restoration of the spire, advised that it would be inexpedient, if not unsafe, to hold services in the Church pending investigation into the extent and character of the mischief. The Church of St. Augustine is rather more than a quarter of a century old, but the tower and spire were not added till about twenty years ago. The structure is in the Gothic style, and the octagonal spire, rising to a height of 185 feet, has been much admired for its graceful outline. The origin of the injury it has sustained can only be conjectured, but the theory which finds most favour is that its insecurity is due to the earthquake shock of last December acting on a fault produced by the spire having previously been struck by lightning. The damage appears to be about 25ft. or 30ft. from the top, and it is anticipated that the spire will have to be taken down and rebuilt from the lowest point to which the damage extends.

ANOTHER of the series of lectures under the auspices of the Arts and Crafts Society of Ireland was recently given in the Royal University Buildings by Mr. John McCloughlin, the subject being "Irish Hammered Ironwork, Old and New." The lecturer said that workers in iron might profitably spend some of their time in carefully inspecting many of the examples of ironwork to be seen in Dublin, both old and new, noting the design, or better still, sketching it, and considering its construction, and, in fact, studying the work so that if they were asked they could make it, and if possible improve on it. Whether any of it was made before 1700 he did not know, but he rather thought that most of it dated from the middle of the last century. There was also some good last century ironwork to be seen in the Corporation buildings. There was very little wrought iron work in Dublin from the end of the last century until about forty years ago. At this time there was a good deal of ironwork imported; but there were at least two firms in Dublin who devoted themselves to artistic ironwork. The gates of St. Teresa's Church, in Johnston's Court, were worthy of notice. These gates were entirely of wrought iron. The leaves, &c., were very elaborate. While most of the ironwork in the Dublin Museum was imported work, he was glad to be able to say that the ironwork of the Kildare Street entrance to the Museum had been

executed entirely in Dublin. The arch over the gates he considered better than any ironwork in Ireland, wrought or otherwise. College Green and Dame Street were likely to become very rich in ironwork. The oldest there were the railings of Trinity College. There were many good smiths in Dublin, but without much experience in Art work. Most of them, however, were very rapid learners, and they soon become skilled workers. It was not the designers that were wanting; it was intelligent patronage that was needed—people who were able to judge of work on its merits, and who did not condemn a thing because it costs a shilling or two more than an inferior article.

GREAT efforts are being made to have British Art strongly represented at the Brussels Exhibition this year, and a circular is being sent round signed by the President of the Royal Academy inviting exhibits. Artists may note that these will be required not later than March 17th, and that they will be returned at the end of October. Sir Edward announces that it is understood other countries are doing their utmost to appear to advantage in their respective Art sections, and that his committee are satisfied that British Art will hold its own if British artists are at all fairly represented. It rests, of course, very much with them to bring this about—with them and with the owners of their works, whose liberality may be counted on.

ST. DAVID'S CHURCH, Exeter, which is being demolished to make room for the new building designed by Mr. Caröe, was erected from the designs of Mr. James Green in 1816-17, and was of the Grecian Doric order. It was a massive and substantial looking building built of stone and faced with plaster. The interior was rather bare, and had large galleries which somewhat darkened the building. There were also several windows containing good specimens of stained glass. The Church also contained several brasses and tablets of interest. The foundation-stone was laid on 4th June, 1816, the anniversary of George III.'s birthday, with considerable ceremony by the then Mayor of Exeter, Mr. Williams, of Duryard Lodge. To mark the event 300 poor persons of the parish received a loaf of bread each with a pot of beer to drink the health of His Majesty. There stood an older building on this site which dated back to 1541. In this building stood a monument to the memory of Sir Thomas Gifford, knighted by James I. for his ingenuity in dyeing a piece of cloth scarlet on one side and blue on the other. He built Great Duryard House, and died there in 1703. The foundation of St. David's Church is an ancient one, being mentioned in 1222.

THE restoration of the ancient tower of St. John's Church, Cardiff, has been commenced. The work is being carried out under the supervision of Mr. C. B. Fowler, who, in his work upon the churches of Glamorganshire, says the tower was designed by one Hart, who designed the fine towers of Wrexham and St. Stephen's, Bristol. The foundation stone was laid in 1473. All these towers are of the Perpendicular style, though St. John's is not so rich as the other two. The embattled parapet, with its graceful pinnacles, is certainly a landmark for ancient Cardiff, of which the inhabitants of the present time should be justly proud. One of the corner parapets had to be rebuilt in 1860, having been struck by lightning. It is some years now since the restoration of the Church began. Four or five years ago the north and south aisles were added, and three years ago the organ chamber was built. Thus, the restoration of the tower completes the restoring of the Church. In connection with the present contract the most important work will be the restoration of the south archway at the foot of the tower, the embattled parapets, the window strings, the cornice and turrets, the groining under the floors, and the glazing of the large west window. The present contract is only for the top, the windows, and the general structure, and amounts to close upon £2000.

IF all future gifts of modern English Art are to be banished to the Millbank Gallery, we fear that the flow of them may be retarded. Unfortunately, the authorities of the National Gallery have no other alternative. The Government, having accepted Mr. Tate's munificent offer, and agreed to the out-of-the-way site for their display, must supplement it by any pictures of a like kind which come into their possession; and it is probable that the near future may find all British work removed from Trafalgar Square. We understand that amongst the first pictures to be treated in this way is Millais's masterpiece of the "Yeoman of the Guard," and this although Mr. Tate's collection is already rich in examples of that artist.

MR. E. R. ROBSON, writing to the "Times" upon the London County Council Works Department, thinks the Council might, before coming to a decision, draw a clear distinction as to the methods most suitable for new works and for repairs, for large works and for small, for those involving capital expenditure and those paid for out of current account. He says that: "In the course of my life I have twice held important public appointments involving the control of a body of workmen for repairs and maintenance. In both instances new works of any size were invariably let by contract. The only case within my knowledge where an opposite course has been pursued was that of the Mersey Docks and Harbour Board, who carried out a long, continuous series of large works in the stupendous extension of the dock system at Liverpool, with their own workmen, and under their able engineer, Mr. George Fosbery Lyster. The only point on which the Council might appear to be able to excel as their own builders is that of paying cash for everything. But the large contractors all do the same. In new or large works they can no more compete with the contractor than the Architect with the speculative builder."

A GREAT deal has been said lately about the increasing cost of the schools erected by the London School Board. The report of the special sub-committee appointed to inquire into the subject shows that the increase is a fact, and the explanation anything but satisfactory. In 1885, the cost per head in twenty-two new schools ranged from £7 0s. 1d. to £9 1s. 11d.; in 1890, seven schools cost from £11 6s. 11d. to £17 8s. 4d.; and in 1895, ten schools cost from £10 13s. to £15 15s. 9d. Part of this increase is due to a general advance in wages in all trades of about one halfpenny per hour during the last ten years, which is not very surprising considering the extent of building operations during that period; but the sub-committee say that "the great difficulty to be faced is the quantity of work done per hour. Speaking generally, the Architect estimates that the work done per hour is now from 25 to 30 per cent. less than it was ten years ago." If it is so, it is a very discreditable fact, and further inquiries should be made to ascertain whether the statement is correct.

A YOUNG artist having succeeded in making an excellent copy of one of the masterpieces in the picture gallery of the Museum at Mayence, thought fit to also copy the signature of the old master, with the result that he managed to sell the picture as an original for a large sum. The fraud was later on discovered, and the authorities of Mayence have, in consequence, just decided that in future no copies of pictures will be permitted to be made of the same size as the originals. The copies must be at least a quarter larger or smaller than the originals.

THE honours paid to the late Mr. Alfred Hunt by the Burlington Fine Arts Club and the Royal Society of Painters in Water-Colours, of which he was one of the most prominent members, are a fitting recognition of his merits. Mr. Alfred Hunt, as is well known, originally began his public career as a painter in oils, and after long abandoning that

medium, he again took it up in later life. The collection at the Burlington Fine Arts Club is better suited and better arranged for the purpose of appreciating Hunt's various excellencies, although it contains nothing earlier than the "Harlech Castle," painted in 1855. This, and all the other works of the early Welsh series, show the extent to which he was influenced by the example and teaching of the Pre-Raphaelites, and one is not surprised that such careful work as that shown in "Climbing Shadows," the "Spring Study of Comel Rhôs," and the more richly coloured picture of "Harlech Castle," attracted Mr. Ruskin's notice, and earned the praises of that exacting critic. As time went on, we trace through the Swiss and Thames subjects the teaching of the author of "Modern Painters," in the elaborate care with which Alfred Hunt treated mountains and clouds. It was, however, on the north-east coast of England, in the district between Bamborough and Robin Hood's Bay, that he was to find his most sympathetic subjects. It was here that he found those ever-varying problems of atmosphere which he delighted to unravel and explain by the medium of his brush, and to produce those exquisite harmonies of cloud and sunlight which gave him a prominent place amongst water-colour painters past and present. No one could render with such delicate effect the subtleties of sea mist creeping up the hill sides under the influence of the sun, which it obscured, and no one could catch more truly the dominant feature of a scene, and whilst recognising the value of details, would never lose sight of the general effect. It was this desire to see the same scene under different aspects which induced him over and over again to paint the same spots, but always with such variety of light and atmosphere as to make each work independent of the other.

THE Carpenters' Company appears determined to be in the forefront of the technical education movement which is growing so rapidly, and again issues their programme of the annual course of free lectures to be delivered in their large hall in London Wall. This Company aims especially, of course, at benefiting, in every way, the trade and profession of Building and Architecture, and this series of lectures deals, therefore, chiefly with matters connected with Building. Professor Fleming, F.R.S., lectures on the Electric Current, and Professor Banister Fletcher and Roger Smith, whose subjects are Architectural, will appeal to the general public, as well as to those engaged in the building trades. We are informed that Lord Reay, Sir John Lubbock, M.P., and other well-known scientific men, have consented to preside on the different Wednesday evenings.

AT Shakespeare's Cliff the work of removing the coastguard station, owing to the landslip there, was completed on the 8th inst. An examination of the foreshore between Dover and Folkestone shows the remarkable way in which the sea has encroached all along this part of the coast during the last few years. Besides the different falls at Shakespeare's Cliff, there have been enormous falls during the last twenty or twenty-five years at Abbots Cliff, which, like Shakespeare's Cliff, is pierced by a South-Eastern Railway tunnel. During recent years points on the foreshore have gradually disappeared, and it is stated that forty years ago high-water mark on this part of the coast was nearly, or quite, 80ft. further seaward than it is now. In recent years the sea has gained as much as three or four feet in a year. The chief cause of this encroachment is attributed to the loss of shingle, which has drifted eastward, leaving the foreshore quite bare where there was formerly a deep bed of beach. These changes have all taken place in comparatively recent years. A large staff of men are at work on the South-Eastern Railway sea-wall. It is a very substantial structure of concrete, with a foundation resting on the rock, and it will run, it is stated, right away from the east end of Abbots Cliff Tunnel to Folkestone. At the east end of Abbots Cliff the sea washes close up to the railway, but the latter is well protected by sea-walls.

A MEETING on behalf of the restoration fund of St. Mary's Church, Warwick, was held on the 4th inst. The Rev. A. C. Irvine read a report, which stated that under the scheme approved in 1894 the galleries and pews have been removed, the new floor laid, the cleaning and repair of the walls and ceiling completed, and structural preparations made for the erection of the organ, and parts of the instrument ordered. The cost has been considerably more than was anticipated. For the repair and restoration of the Church and tower, £13,637 have been since 1884 contributed and expended. But an additional sum of £2550 is still required to discharge liabilities already incurred and complete the work contemplated. —Lord Warwick moved the adoption of the report, and explained that certain supporters had given a guarantee for £1700, and in addition there were immediate liabilities of between £900 and £1000.

MR. KINETON PARKES, the Principal of the Nicholson Institute, Leek, is to lecture before the Birmingham Ruskin Society (the Society of the Rose) on March 10th, his subject being, "Mr. Ruskin and the Pre-Raphaelite Movement." There will be an exhibition of a large number of reproductions of drawings and pictures by members of the Brotherhood and their immediate followers, many of which were used for the illustration of Mr. Parkes' lecture at the London Institution, on "Rossetti," some two or three years ago.

THE offer made by Mr. J. J. Thornycroft to present to the County Council the model of his father's statue of Boadicea, if the cost of casting the group were defrayed by private subscription, or out of public funds, has met with the sort of reception which seems in this country to be reserved for such generosity. Efforts to raise the necessary sum among Art lovers have been inadequately responded to, and the County Council pleads the absence of any legal power to spend money for such a purpose. Mr. Thornycroft has, therefore, found himself obliged to undertake the responsibility of making up the deficiency in the subscription. Thanks to his public spirit, there seems now some chance that the Boadicea group may become a visible fact, and there is a far more remote chance that, if a Bill, which the council has undertaken to promote, becomes law, some of his outlay may be repaid to him. Still, the episode is distinctly discouraging, and calculated to check the flow of private munificence in Art matters.

MR. ROBERT BURNARD lectured on "Pre-historic Monuments and their Preservation" at Plymouth recently. Mr. Burnard confined his remarks mainly to the question of the preservation of ancient stone monuments, with special references to examples in Devon and Cornwall. It was well known, he said, how ruthlessly these had been pillaged and destroyed in recent years; they need not go further than Dartmoor to find numerous examples of the destruction of kistvaens, and circles, and other interesting prehistoric structures, by the builder and the road mender. The forest of Dartmoor was now well looked after, and the Duchy authorities would not allow any tampering with the antiquities, but the commons adjacent thereto were still the happy hunting-ground of the mender of roads. They knew that recently a stone road and a circle had been destroyed on Sherburton Common—in the locality of Ashburton—a piece of vandalism of which the Newton Abbot District Council was not aware until after the mischief had been done. With every possible care, however, any of the stone monuments must always be in danger, unless they were marked with a "broad arrow." What could be done to protect these monuments? In the first place they should be surveyed. An archaeological survey of the United Kingdom should be undertaken by the Government. After this had been done means must be taken to adequately protect the monuments. Some years ago, in 1882, an Act was passed, mainly through the instrumentality of Sir John Lubbock, entitled the Ancient Monuments Protection Act. This Act consisted of about

a dozen sections, and gave power to commissioners of works and guardians of ancient monuments to purchase ancient monuments, to bequeath them to commissioners, to appoint inspectors, and to impose penalties for vandalism. At the end of the Act was a schedule of the antiquities which were preserved by the Act. In England there were 29, in Scotland 21, and in Ireland 19. The nearest county which benefited by the Act was Somerset. The Act seemed to be inoperative, as the Government steadily refused monuments even when they were offered to them. Having compared this state of things with the excellent provision made in France for the preservation of ancient monuments, Mr. Burnard said what ought to be done was to extend the Act so as to make it impossible for the Government to refuse to accept any monument offered which, in the opinion of a body of experts, was of sufficient interest to demand protection.

MR. ADAMS, the new manager of the Works Department of the County Council, has been engaged for the last five or six years in re-organising the system and the re-construction of the line of the Western Railway of Buenos Ayres. He was for many years engineer on the London and North-Western Railway, during a portion of which period he had charge of the maintenance of the company's stations in London. He also directed the construction of a dock and harbour at Holyhead, and the rebuilding of two viaducts, one at Stockport and the other at Llandulas.

MR. HAMAR BASS, M.P., has intimated his willingness to give £15,000 for providing a Church and vicarage for the proposed new district of All Saints', Burton-on-Trent, on condition that an endowment of £300 per annum is raised. Towards this income Messrs. Bass, Radcliffe, and Gretton have promised £3000, and Lord Burton £2000. Mr. Gretton is erecting a Church, at a cost of £20,000, at Stretton, on the outskirts of the borough; and at Horninglow, another suburb, Lord Burton has deposited £10,000 for a Church, on condition that a similar amount is raised for endowment.

A DEPUTATION representing the United Government Workers' Federation recently waited upon a number of members of Parliament at the House of Commons to lay before them grievances regarding their employment, with a view to raising discussion when the votes involving these matters came before Parliament. The deputation, about twenty in number, represented practically all the associations of Government employés except those engaged at Woolwich. Several speakers advocated increased wages, a minimum wage, provision for widows and orphans, the abolition of classification, the abolition of contracting and sub-contracting, the granting of civil rights to public servants, and the rearrangement of hours of attendance, and complained of reductions in pay to provide for pensions, and the slow rate of promotion. Sir Charles Dilke, in reply, said that the Committee on the Fair Wages Resolution had been reappointed, and if any cases as to improper conditions under the contracting system were forwarded to him he would bring them before the Committee.

SINCE the settlement of the bricklayers and labourers' strike there has been unusual activity in the building trade in all parts of Leeds. The mildness of the winter has favoured the pushing forward of contracts that had accumulated during the long dispute, and at the present time there is a prospect of abundant work. As is the case in other townships in the city, Armley is progressing rapidly, houses rising in every direction. Only recently between 20,000 and 30,000 square yards of land, off Wiring Field, and with entrances from Town Street and Tong Road, was privately sold, the intention of the purchaser being to erect workmen's dwellings on the property. The Armley Old Cricket Field has again changed hands. A portion of this estate, with a frontage to Armley Road, has been sold to the Leeds School Board, and that authority

will shortly commence to build a new school there. The remaining land will be laid out for the erection of houses of a superior class, each dwelling having a front garden. The other side of Armley Road will also be further developed. It is understood that a mill which was lately gutted by fire is coming into the hands of the builder, and the site, as well as a large quantity of land behind, will be utilised for building purposes. Several open spaces set apart some months ago for the erection of both scullery and through houses are being fast filled up by the builder. The large estate adjoining Armley Park is likewise being rapidly developed.

M. SVORONOS, the director of the Numismatic Museum in Athens, has expressed a conviction that the remarkable bronze statue found at Delphi by French excavators represents, not Hiero, the Tyrant of Syracuse, but one of the Kings of Cyrene. He bases his theory on Pausanias' comparative study of the coinage of Cyrene, the ancient province of Africa. In his opinion the statue is the work of the sculptor Amphon, of Gnossus, in Crete. According to Pausanias, it was erected at Delphi by Arcesilaus, the last King of Cyrene—the ruler who was eulogised by Pindar, whose verses are inscribed on the pedestal. M. Homolle, the Director of the French Archaeological School, disputes the theory of M. Svoronos, whose conjectures have attracted considerable attention.

ONE of the most interesting old buildings in the county of Somerset—the venerable landmark near Weston-super-Mare called Woodspring Priory—has narrowly escaped destruction by fire, after an existence of nearly seven hundred years. This ancient priory is now, and has been for many years, used as a farmhouse. It was erected in 1210 by William de Courtenay, a relative of the De Tracy, one of the murderers of Archbishop à Becket. Although the sheep-bell has replaced the vesper-bell of old, portions of the original edifice still remain to testify to the grandeur and massive character of the structure. The tower retains much of its original style, and the ruin is, in consequence, a source of considerable attraction to visitors to Weston.

A GENERAL Assembly of the Royal Scottish Academy was held on the 10th inst.—Sir George Reid, president, in the chair—to elect a member in room of the late Mr. J. Denovan Adam, and two honorary members. Three associates were nominated for the vacancy—Messrs. P. W. Adam, G. Ogilvy Reid, and A. Roche. In the first vote, with the proxies of absent electors counted, the principal figures were: Mr. Reid, 18; Mr. Adam, 16; and Mr. Roche, 12. In the second vote one or two candidates who had received less than seven votes having been struck off, the poll stood: Mr. Reid, 20; Mr. Adam, 19; and Mr. Roche, 8. Mr. Roche having been dropped the final division, in which only those present take part, was: Mr. Adam, 21, and Mr. Reid, 20. The two honorary members elected were Sir E. J. Poynter, President of the Royal Academy, and R. Rowand Anderson, LL.D., Architect. Dr. Rowand Anderson, it may be recalled, was at one time an Associate of the Royal Scottish Academy, but resigned his connection with it in 1883. His election now as an honorary member is a recognition of the admirable work he has done in the interval as an Architect, and as honorary director of the Edinburgh School of Applied Art.

At the Stockholm Exhibition this year, the year 1897 will be noteworthy in the history of the Scandinavian North. The great Industrial Hall, which has a floor surface of 16,000 square metres, is the greatest wooden building that has ever been constructed. Its great cupola rises to a height of about 100 metres, and is surrounded by four minarets, containing prospects bridges. Another of the principal buildings of the Exhibition is the Northern Museum, with its provisional addition, destined for the Cultural Exhibit. On the shore of Djurgårdsbrunnsviken, with more than the half of it built out over the water, lies the

Swedish and Danish Fishery Hall, a most original building, designed by Eugen Thorburn. Norway, with its enormous fisheries, will build its own fishery hall. Great viaducts lead to the other parts of the Exhibition grounds. Here another view opens before the eyes of the visitor, the beautiful panorama of Stockholm's famous harbour and its charming environs. The principal building of this section of the grounds are the Machinery Hall, a giant building of iron and glass, having a floor surface of 10,000 square metres, and the great Art Hall.

A PARISH meeting was held at the Town Hall, Upton-on-Severn, a few days ago, for the purpose of considering what should be done with the Old Church, which has now been disused for fourteen years, and is rapidly going to decay. It was remarked that the present state of the Church was a disgrace to the parish, and an eyesore to anyone entering the town. This would increase unless something was done to put it in repair, or pull down all except the tower. The monuments in the Church must be preserved with due care. Another speaker would have been glad to see something done in time past so as to retain the building for the purposes for which it was erected. It was too late now, and they had to choose between restoration and demolition. He moved a resolution asking that a faculty be obtained, and the Church taken down, leaving the tower only. An amendment, however was carried authorising the appointment of a Committee to decide upon the necessary repairs, and to get estimates from local builders.

AN interesting discovery has just been made at Luton. Excavations were being made in Waller Street, when the workmen came across two brick cavities, extending about 5ft. beneath the pavement. The floor of one is laid with dark blue tiles, while the arched roof is covered with red tiles and bricks. On the floor were found a quantity of bones and cows' horns, as though the spot had been a place for the disposal of refuse. It is computed that the tiles, cement, and bricks, are at least 1000 years old. The cavity is believed to be a hypocaust, or an oven, and was in use at the time of the Roman occupation.

At a meeting of the German Archaeological Institute, held in Athens, M. Dragoumis, the former Minister for Foreign Affairs, who is an enthusiastic amateur of Greek antiquities, read a paper describing the discovery of an interesting inscription on one of the steps of a marble staircase in a peasant's dwelling on the island of Salamis. The inscription consists of the first two lines of the epitaph composed by the celebrated poet Simonides for the tomb of the Corinthians who lost their lives at the Battle of Salamis. The lines are carved in Corinthian characters, and differ but slightly from the text of the epitaph as contained in the Greek anthology. On the strength of this discovery it is hoped that it will now be possible to discover the exact place of burial of the Corinthians who played a leading part in the famous sea-fight. At the same meeting Dr. Zahn exhibited a newly found potsherd, inscribed with the name of Themistocles, at the time when he was ostracised in 471 B.C. This is the only fragment of the kind yet discovered which bears the name of the great general and politician.

THE loan exhibition of pictures, which is to be opened at the Guildhall in the latter part of April or the beginning of May, will be a Victorian Exhibition, inasmuch as it will only contain works produced during the present reign. It is hoped that some of the best examples of the leading English artists during that period will be among the exhibits. It is understood that the Queen has consented to lend the celebrated "Roll Call" for the exhibition.

A NOVEL railway waggon has been built at Moscow for the Trans-Siberian line, and will shortly be dispatched thither. This is the "church waggon." In form it is like the

ordinary long first-class carriages on two four-wheeled bogies; but the window-frames are surrounded with mouldings in the Byzantine church style. Inside, two-thirds of the length are taken up with the triple entrance-door and the standing space for the congregation, the other part being devoted to the officiating priests. There are the usual railway carriage doors at either end.

ON behalf of Sir Henry Brownrigg, plans were recently submitted to the County Council for the erection of a theatre seated for 800 people at the junction of Norris Street and St. Alban's-place, Haymarket. Although the Committee was willing to sanction the scheme, it was withdrawn to allow further consideration of the site. The same procedure followed a few weeks later, and the Committee, having had three opportunities of examining the proposal, recommend it for the approval of the Council.

THE bill promoted by Sir F. Dixon-Hartland for the solution of the London water difficulty was issued to Members of the House of Commons. It proposes the amalgamation of the eight metropolitan companies, and the creation of districts somewhat on the lines of the Gas Act of 1860. Within six months of the passing of the measure the companies north and south of the Thames are to prepare schemes; and within one year the Chelsea, Grand Junction, and West Middlesex companies are to be united into one company, the Kent, Lambeth, and Southwark another, and the East London and New River a third. Power is reserved the New River Company to remain a separate undertaking, and in that event the East London Company would amalgamate with the western companies. The board for the control of the new companies would consist of three directors from each of the component companies, and two others appointed by the Board of Trade. An arbitrator would be chosen to settle whatever disputes might arise, this functionary to be either an ex-Lord Chancellor, a Law Lord, or a Member of the Judicial Committee of the Privy Council. It is claimed that the scheme would benefit the ratepayers by making any future water famine impossible, reducing and equalising the charges, and removing the rival interests of the inner and outer circles.

PROFESSOR H. HEKKOMER, R.A., opened the eighth spring exhibition of oil paintings and water-colour drawings at Oldham. About 350 works were hung, the Artists represented including Sir E. Burne-Jones, J. J. Shannon, J. S. Sargent, Briton Riviere, F. Hall, David Murray, Isaac Cooke, Robert Fowler, H. La Thangue, and Miss Henrietta Rae.

THE first of four popular lectures, in connection with the Arts Faculty of University College, Liverpool, was delivered on Friday evening by Mr. D. S. McColl, the well-known Art critic, and an appreciated exhibitor at the New English Art Club. He gave an interesting sketch of English painting in the Victorian era, and incidentally hinted that he was not very sanguine that success will attend the present efforts to promote decorative and applied Art.

SOME further particulars of the proposed re-building of the Windsor Station of the Great Western Railway, in commemoration of the Diamond Jubilee, are to hand. The directors intend to lay out a sum of £60,000 on the project. The works include provision for three, instead of two, platforms, as at present, and provide for a reception-room, to be called the Queen's Room, together with a suite of apartments for the convenience of guests arriving at or departing from the Castle. The Queen's Room will be ready by June, and will be of Bath stone, with a domed glass roof. Internally, it will be panelled with teak. In the rear of this will be a covered way of 80ft. span, where the guards of honour will be drawn up. The rest of the station, the contracts being only just let, will not be finished until toward the close of the year. A handsome elevation will be provided in

what may be called the Victorian Renaissance style, of red brick and Bath stone, and the Thames Street approach will include a roomy covered way with circular roof.

MR. J. MASON, Architect, of Wolverhampton, has received instructions for plans and working drawings for a residence in Waterberg, Transvaal, South Africa, the cost of which will be between £4000 and £5000. Some idea may be gained of the class of building from the fact that the external walls of bricks are 27in. thick, the internal 18in., the roof being galvanised iron, slates not being used in that country.

ARCHAEOLOGY, like the physical sciences, scores a brilliant triumph occasionally. Our own generation has witnessed the outcome of Schliemann's self-sacrificing labours, the discovery of a lost Aristotelian manuscript, the musical reconstruction of a hymn to Apollo, and many additions to our knowledge of ancient Egypt, the Holy Land, and the East. But all these revelations, great as may be their value, must yield in personal interest to that strange relic of the past which Professor Dörpfeld unearthed a few days ago from the sacred soil of Athens. Whilst digging to the north-west of the Areopagus, the famous site of the Supreme Court of Justice, the spade turned up a humble potsherd impressed with the words "Themistocles Phrearrhos." Little doubt is felt that this fragment of tile served to record one of the six thousand votes by which the fallen statesman was condemned to ostracism in 471 B.C.

THE excavations which have been carried on at the Plemmyrium promontory at Syracuse during the past fortnight, under the direction of the Conservator of Monuments, the Chevalier Reina, have led to the discovery of the foundations of a colossal antique tower, which is believed to date from the Greek epoch. These foundations consist of enormous blocks of marble and Egyptian granite, which are joined together with marvellous art, not a trace of cement being perceptible. Portions of columns which evidently used to surround the main building have also been found. These also were made of solid blocks of marble and granite. Excavations to isolate completely the *Ara* near the Greek theatre have also been resumed, and have resulted in the discovery of fine relics of antique Art, such as a bronze statuette, various vases, lamps, and coins.

THE Local Government Board has sanctioned loans to the amount of £7000 for carrying out the sewerage and sewage disposal works at Knaresborough. Two sections of the work have been completed.

M. FAURE opened recently the continuation of the Rue Béaumur, planned long ago by Haussmann, but only now executed. This gives a wide and straight thoroughfare from the Bourse to the Square du Temple. The cost has been 47 million francs, but the sale of building sites is expected to reduce the net cost to 39 millions.

MRS. EMMELINE FISHER, of Abbotsbury, Newton Abbot, who died recently, has bequeathed £2000 for the furnishing of Newton Cottage Hospital, which is in course of erection. This is in addition to the £5000 she gave some time ago towards the building of the institution. She has also left a library of about 40,000 volumes to the Exeter Museum.

SIR JOHN LLEWELYN, M.P., having written to the Board of Works in connection with the agitation for an improvement of the plans of the proposed new post-office at Swansea, has received a reply informing him that the plans are only in a preliminary stage, and the views of the Corporation will receive the fullest consideration.

At Lynton and Lynmouth the Esplanade and Pier question is just now very much talked about. It seems hardly credible that the local body should have built an esplanade which has cost thousands of pounds without first obtaining a lease of the rights of the foreshore? Yet this is stated to be a fact. The ratepayers are anxiously awaiting some explanation.

### THE GLASGOW AND WEST OF SCOTLAND TECHNICAL COLLEGE.

THE annual report has just been presented to the Governors. It states that the past year has been more than usually interesting in the history of the Glasgow and West of Scotland Technical College, as being the centenary of the foundation of Anderson's College, which received its charter of incorporation from the magistrates of the City of Glasgow on June 9th, 1796. Besides being the oldest member of this composite institution, the interest attaching to Anderson's College—apart from the fame of its medical school, now a separate institution—lies in the fact that it was the progenitor of Mechanics' Institutions and the pioneer of technical education in this country. The centenary was celebrated, on the evening of Oct. 22nd, by a public banquet, which was attended by a numerous company, including representatives of the leading industries and local institutions, besides the Governors and principal members of the teaching staff of the College. The remarkable growth of the institution since its foundation is best exemplified by the fact that the number of subjects taught in the College has risen in the day classes from 16 in 1887 to 39 in 1896, and in the evening classes from 34 to 65; the number of students, from 1793 to 3327; of enrolments, from 2946 to 5061; and the amount of class fees, from £2220 19s. 6d. to £4237 18s. 6d. In Allan Glen's School also the curriculum has been considerably extended, both on the literary and on the scientific side—the latter more especially in the laboratory and workshop courses; and the number of pupils on the roll has risen from 439 to 637. Of course, these additions were not possible of attainment in the premises taken over by the Governors at the amalgamation, as each institution was found to be

#### WORKING UNDER CONSIDERABLE PRESSURE

and difficulty; and the increased accommodation now provided has cost, in the case of the College, an expenditure of about £6000 on alterations and reconstruction of our own buildings, and an annual expenditure of £261 for rented premises; while in the case of the School the additions to the building have cost £10,563. The only changes which have taken place in the governing body during the past year have been the appointment of Mr. David Thomson, Architect, to succeed Mr. Honeyman, who retired at last annual meeting; and of Mr. John M. Martin, of Auchendennan, to succeed the late Rev. Dr. Burns, whose death was intimated at the same annual meeting. The report enters into details concerning the work of the past year, and gives particulars respecting the number of students. Last year there was a slight set-back in the number of day students, but this has been much more than compensated for by the advance observed this year, which is the highest on record, both for day and evening students. With regard to the day classes, which show a net increase of 105 entries; the most conspicuous advance is in Mathematics, which showed the largest growth last year also. The increase in Mechanical Engineering, which appears next highest in amount of growth, is mainly due to a larger number taking the full course, while there are fewer taking the sub-sections or special courses. The proportionately large increases in the number of students taking the Mining and Geological Laboratory and the Lectures in Mineralogy justify the steps taken by the Governors a few years ago to improve the curriculum in Mining. Apart from the falling off in the number taking special courses in Mechanical Engineering, referred to above, the only classes which show a reduction are the Wood-workshop, the lectures under the Young Chair, and the course in Practical Photography. In the evening-class enrolments, which show a net gain of 338 this session, Professor Gibson's classes in Mathematics head the list with an increase of 72; Mr. Longbottom's classes in Mechanics come next with an increase of 65; the Art and Signwriting classes follow with 57; and Build-

ing Construction is still advancing, with 50 students more than the large increase shown last year. Taking Professor Jamieson's classes in Electricity, Electric Lighting, and Telegraphy together, his enrolments show an increase of 91; and Professor Henderson's classes in Chemistry, theoretical and practical, show a total increase of 50. The

#### OTHER MORE NOTEWORTHY ADDITIONS

are—20 in Professor Watkinson's Laboratory, 15 in the Cabinet-workshop class, and 14 in Professor Rowden's Drawing classes. With the exception of the reduction of 25 in Professor Blyth's class in Theoretical Mechanics, the fallings off are unimportant, and are spread over many departments. The question of site for the proposed new buildings of the College has at length been practically settled. In the selection the Governors were bound to consider (1) the convenience of evening students, (2) the extent of ground, and (3) the price. And among the various sites suggested, these considerations were most nearly realised by the piece of ground belonging to the Corporation situated in North Street, and adjoining the St. Andrew's Hall. The Bellahouston Trustees have arranged with the Corporation to hold this site for the building of a Technical College for a period not exceeding two years from Whitsunday, 1897.

### THE CLERKS OF WORKS' ASSOCIATION.

THE members of the Clerks of Works' Association held its annual dinner at the Holborn Restaurant. Mr. Beresford Pite (president of the Architectural Association) was in the chair, and was supported, among others, by the president of the Association (Mr. W. S. Woolacott), Professor T. Roger Smith, Mr. J. E. Drower, Mr. F. Dashwood, Mr. Stanton W. Preston (clerk to the Carpenters' Company), Mr. Alderman Taylor, L.C.C. (president of the Croydon Master Builders' Association), Mr. T. B. Whinney, Mr. J. G. Peacock, Mr. W. J. Plume, Mr. J. Brady, Mr. P. J. King, Mr. J. Spooner, and Mr. J. Plowman.—Mr. J. Brady, in proposing "The Health of the Architects and Surveyors," spoke of the difficulty one branch of the building trade would experience without the co-operation of the others.—Response was made by Professor Smith, who remarked on the strain involved upon the Architect in designing and planning his buildings on paper. When the next stage came, however—that of the erection of the building—the Architect wanted someone who would be as eyes and ears to him. That someone must be—if they would allow him to say so—a man who had spent his life in a different class of work from the Architect; he was the Clerk of Works. As a body, Clerks of Works were a most intelligent set of men, and he had every reason to believe that the coming generation would be equally intelligent and practical, for, in the course of his work as an examiner, he had come across some very promising young fellows.—Mr. F. Dashwood proposed "The Worshipful Company of Carpenters." They could not, he said, fail to feel indebted to the Carpenters' Company for their good work in the cause of technical education, and for their endeavours to enable young mechanics to improve themselves in the various branches of their trade. In the old days of long apprenticeships, almost the only things that boys were taught to do, comparatively speaking, were to sweep up the shavings, stir the glue-pot, turn the grindstone, and fetch the beer; but now, thanks to the beneficent work of such institutions as the Carpenters' Company, young men were taught, by means of technical education, to improve their knowledge in all branches of the trade, and to do work which the masters of the older days would not have dreamt of teaching them.—Mr. Preston, in reply, pointed out that there were 233 students at Titchfield Street, and the Carpenters' Company were very grateful to think that their efforts were so well appreciated.

### IMPORTANT SANITARY ACTION.

IN the case of *De Sziemanowicz v. Hateley*, heard before Mr. Justice Wills and a common jury, last week, the plaintiff claimed damages for a breach of warranty and for a fraudulent representation by the defendant that the drains at 67, Chatterton Road, were in a proper sanitary condition. The defendant denied the warranty and the misrepresentation, and alleged that there was nothing wrong with the drains. It appeared that the plaintiff, who is employed as a sorter at the Post Office, took the house in question on September 25th, 1893. On his inquiring about the state of the drains, the defendant said: "The drains have just been done on the latest sanitary principle, and are in a good sanitary condition." The house was a six-roomed one; the plaintiff went to live there with his wife and children; they had living them a Mr. and Mrs. Woodhouse, with their child, and a Mr. Wakelin, the plaintiff's father-in-law, as lodgers. The plaintiff's wife was taken ill at Christmas, 1893, and in the early part of 1894 was obliged to attend the hospital. She was suffering from a wound in the hand, which obstinately refused to heal. The children were afterwards taken ill; two of them died of broncho-pneumonia following on whooping-cough, and the other of the same complaint following on an attack of measles. The drains were tested and the smoke-test applied; it was found that the smoke escaped into the house. The drains were subsequently taken up and found to be leaky in the joints, and in a very bad condition. Confirmatory evidence was given by the plaintiff and his wife, after which witnesses, who had applied the smoke-test and taken up the drains, were called to prove the state of the drains. The main drain had not been jointed, and the sewage matter had leaked out into the soil. Medical evidence was also given in support of the plaintiff's case. Dr. Bailey attributed Mrs. Sziemanowicz's illness in 1895 to the bad state of the drains, and an outbreak of measles might be due to the same cause. It was submitted, on behalf of the defendant, that there was no evidence of a warranty. The agreement under which the plaintiff took the house was in writing; if a warranty was given it must appear in the written contract. Parole evidence could not be given to vary the terms of that contract. If the plaintiff relied on a representation as to the state of the drainage, then to fix the defendant with liability it must be shown that it was false. There had been no suggestion that the defendant knew or had any means of knowing that the drains were wrong. If, however, the defendant had made a representation innocently, believing it to be true, he would not be liable. That was the defendant's case. He had had work done to this house in 1893, and he believed that the drains were all right; and he had good reason for that belief. It was not suggested by the plaintiff that Mr. Hateley knew that anything was wrong with the drains, and after having had all this work done in 1893 it could not be said that he was reckless in saying that he believed them to be all right. The defendant stated that he owned several houses. The one in question had been constantly occupied, and no complaint had ever been made as to the drains until the present action was brought. He denied that he had said "that the drains had just been done on the latest sanitary principle," as alleged by the plaintiff. The only thing he said was that he believed the drains were all right. He detailed the work which had been done in 1893. Further evidence was given, and in summing up Mr. Justice Wills put the following questions to the jury: (1) Did the defendant tell the plaintiff that the drains had just been done on the latest sanitary principle, or that they were in good sanitary condition? (2) Were such statements as were made, made by way of warranty and intended to be acted on? (3) Were they untrue? (4) Were they made dishonestly? The jury answered all the questions in the affirmative, and assessed the damages at £65. Judgment was entered accordingly.

## Professional Items.

**ABERDEEN.**—Messrs. Livermore Brothers have now instructed Mr. John Rust, Architect, to accept tenders for the erection of a new Empire Palace Theatre in Bridge Place, on the site of the hall destroyed by fire. The contracts amount to over £10,000.

A special meeting of the Aberdeen Parish Council was held on the 15th inst., to consider a report from the Works Committee on the proposal to provide new offices for the Council. The report of the Works Committee recommended the purchase of the Savings Bank and the site of the new School Board offices. It also dealt with the advisability of altering the present offices, and with two other sites in Union Terrace, and the site in Schoolhill and Belmont Street, which was recently under the consideration of the Council. It was found that the present building could not be altered, and that the cost of the property fronting Castle Street (£2000) was too high. With regard to a site on the north end of Union Terrace, with frontages to Silver Street and Skene Terrace, it was found that the building, owing to the circular nature of the feu, would be costly; the site immediately to the north of the School Board site was found too small, and it was reported that one of the proprietors at Schoolhill had sold his property. The committee therefore gave their recommendation in favour of the site between the Savings Bank and the School Board offices. The cost of the properties is £3700, but the building material which could be used in the erection of the Council's offices was valued at £400. The matter was deferred.

It is stated that a property in Woolmanhill is being brought under the notice of the Post-office authorities as a site for the new Aberdeen head Post-office. The property referred to is the almost square piece of ground bounded by Woolmanhill, John Street, North St. Andrew Street, and St. Andrew Street. The price which is mentioned for the ground is £7000. With regard to the Dee Street site, steps are being taken which will enable a definite offer to be laid before the Post-office authorities on an early date.

**BELFAST.**—The erection of a new post office has been commenced at the rear of the central postal and telegraph buildings in the little narrow artery which stretches from Berry Street to Garfield Street, and bears the somewhat historic title of Charlemont Street. The new edifice will be a large, plain, three-story brick building, connected on the third flat with the rear of the present postal establishment in Royal Avenue with a spacious gangway bridge across Charlemont Street, in the same manner as the shop, warehouse, &c., of the Workshops for the Blind are joined to their dépôt in the same thoroughfare. On the ground floor there will be the receiving office for parcels and also the waiting-room for the telegraph messengers. The entire of the second floor and a portion of the third will be devoted to the sorting and despatch of parcels, while the remaining portion of the latter not occupied with parcels will be used as stores, and here there will also be a dining-room for the sorting clerks and telegraphists, together with the kitchen. When the new block of buildings has been completed there will necessarily come a rearrangement of the present apartments. It is to be regretted that the new edifice will not be one of much larger dimensions, that it is not being made to cover the entire space away over to Smithfield. The contractors are Messrs. H. and J. Martin, of Belfast, who are carrying out the work under the supervision of Mr. Cochrane, of the Architectural Department of the Irish Board of Works.

**CARDINGTON.**—During the week, workmen from the firm of Messrs. Taylor, Loughborough, have been taking down the bells of the Parish Church, which were hung in 1772. They will be sent to Loughborough to be touched up and toned, whilst the tower of the

Church, it is understood, is to be rebuilt, and the Church itself renovated and reseated, with better warming arrangements.

**COATBRIDGE.**—The trustees of the late Provost Alexander, Coatbridge, have applied for power for the erection of an hospital, to be called the Alexander Hospital, in Blair Street, for which the deceased left £30,000. The plans, which were passed, have been prepared by Mr. A. McGregor Mitchell, Architect, Coatbridge, and show a handsome set of buildings in the old Scottish baronial style of Architecture. The cost will be about £8500, and there will be thirteen beds for patients meeting with accidents in the districts of Old and New Monkland and Shotts. The buildings will cover 1½ acres of ground near Gartsherrie and Drumpellier Station, N.B.R., and will include nurses', doctors', convalescent, &c., rooms.

**COVENTRY.**—Plans prepared by Mr. W. Hattrell have been accepted for a new Wesleyan Chapel to be erected at the corner of Eagle Street and Stoney Stanton Road. The estimated cost is about £4000. The present chapel, on a part of the same site, is a comparatively recent erection, and is intended to be used as a Sunday-school.

**GLASGOW.**—Mr. Dobson's High School Building Construction Classes were on Saturday last shown over the Lancashire Insurance Buildings, which are now in course of completion. Started in May last, no time has been lost in its erection, as many as 200 masons and 100 hewers being engaged on it at times. The main entrance to the offices will be from West George Street. They will occupy this entire frontage on the street level, in addition to the basement. Fronting Renfield Street will be shops, with business premises in the flats above, which may be reached by the main staircase, or hydraulic elevator placed in the well. The five odd stories which it is in height give it a very imposing appearance, the Architecture being Venetian in character. The ground the building covers ranges between 6000 and 7000 square feet, the red stone it is built with coming from Locharbriggs Quarry, Dumfries. Mr. James Thomson is the Architect, and the building is expected to cost close on £30,000.

**GLOUCESTER.**—At a meeting of the Improvement Committee of the Gloucester City Council, plans of a new Theatre and Opera House, which a London syndicate are about to erect on the site opposite the Municipal Schools in Brunswick Road, were submitted and passed. The plans, which have been prepared by Mr. John P. Briggs, of Effingham House, Arundel Street, Strand, are for an imposing building of brick and terra-cotta. Seating accommodation will be provided for 1500, and from each seat there will be a clear and uninterrupted view of the stage. The latest lines have been followed in regard to comfort, exits, electric lighting, and ventilation.

**HOLBECK.**—The plans for the erection of the proposed new theatre at Holbeck have been submitted to the Leeds Stage Plays and Music Licenses Committee. Some time ago, it will be remembered, these plans came before the Building Clauses Committee, and objection was made to the limited number of exits shown. Subsequently an interview took place between representatives of the Building Clauses Committee and the Architect of the building, when alterations were made in the plans to meet the wishes of the Committee. The Building Clauses Committee sanctioned the plans, and Mr. Reynolds has now carried out the improvement.

**MORLEY.**—The Corporation has decided to erect a set of public baths in the borough. The site selected for the purpose is a sloping piece of ground fronting on to Fountain Street, and immediately in front of the site for the proposed electric generation station. Out of the fifteen plans that were sent in, the committee having charge of the scheme has chosen

those submitted by Messrs. Holtom and Fox, of Dewsbury, the firm of Architects who, some years ago designed the bath premises at Burnley. To be built of Morley stone, the front elevation of the building will not be unattractive. In the centre, the building is to be two stories high; the rest of the structure will be a single story. The estimated cost of carrying out the scheme of the Corporation is £6,000.

**MOSELEY.**—At a recent meeting of the committee, the designs for a new Church, lecture hall, &c., to cost £6000, at the corner of Chantry Road, Moseley, were considered, and out of seven sets of designs submitted, those of Messrs. de Lacy Aherne and Arthur E. McKewan, A.R.I.B.A., were placed first.

**NEWCASTLE.**—The opening of the new Recreation Hall at the Royal Victoria Schools, Newcastle, took place on the 12th inst. Mr. W. L. Newcombe was the Architect, and the contractor, Mr. Pringle, of Gateshead. The hall is 50ft. in length by 20ft. in width inside. It is well ventilated, lighted and heated, and internally and externally is of very attractive appearance. The lighting apparatus has been fixed by Mr. Percy, of Barras Bridge, the heating has been done by Messrs. Emley and Sons, while the racks and other fittings were put in by Messrs. Worley and Son, of Benwell.

**PAISLEY.**—Offers for the erection of the new Technical School in George Street have been accepted as follows:—Mason work, Messrs. John Bryce and Co., Paisley; joiner work, Messrs. J. and W. McInnes, Paisley; plumber work, Messrs. Hunter and Goudie, Paisley; slater work, Messrs. James Jeffrey and Co., Paisley; plaster work, Mr. D. T. Hutchison, Paisley; tiler work, Messrs. Galbraith and Winton, Glasgow; iron work, Messrs. P. and W. McLellan, Limited, Glasgow; cement and paving work, Mr. John McKenzie, Glasgow; heating and ventilation, Mr. William Key, Glasgow. The building, it is expected, will cost about £20,000. The main fronts are to be built of stone from Cullalo Quarry, Fife shire, and the corridors, cloak rooms, lavatories, vestibules, &c., will be laid with terrazzo. The Architect is Mr. T. Graham Abercrombie Paisley.

**PATRICROFT, NEAR MANCHESTER.**—It is proposed to considerably add to this important workhouse by the addition of wards for imbeciles and sick and infirm inmates, altogether providing further accommodation for about 300 paupers. A number of Manchester Architects are engaged upon competition plan for this purpose.

**SWAFFHAM.**—The spire of the Parish Church has been examined by Messrs. Milne and Hall Architects, of London, and found to be unsafe. Plans and specifications have been prepared by the Architects, and the work has been entrusted to Mr. George Jeffries, builder, and we understand will be commenced at once. It is anticipated that the general design of the spire will be unaltered, although more carved work will be executed in the open part of the lantern, and eight carved gargoyles supplied to take off the water at the base of the spire which will, it is supposed, improve the appearance of the spire. It is understood that the cost will be over £400.

**WELLINGTON, HEREFORDSHIRE.**—A new schoolroom, to accommodate fifty-four infants which has just been erected for the Wellington School Board, was completed and opened last week. The new room adjoins the present classroom, and is divided by folding glass doors, which can be thrown into one large room when occasion requires. In addition new cloakroom, lavatory, offices, and other accommodation has been added. The new wing is of red brick, with Bath and local stone dressings and strong courses. The work has been carried out by Mr. Wm. James, builder, of Bromyard, from the plans and under the superintendence of Mr. Ernest G. Davis, Architect, of Hereford.

**WORCESTER.**—The Countess of Coventry has laid the foundation-stone of the new Nurses' Home at the Worcester Infirmary. The works are being executed by Messrs. Wood and Sons, Worcester, from the designs of Messrs. Lewis Sheppard and Son. The building, which will cost about £4000, is being erected in Wheeley's Gardens, adjacent to the Infirmary. It will be a three storeys, and thirty-two bedrooms will be provided for sisters and probationers. A covered way will afford direct communication between the home and the Infirmary.

#### SOCIETY MEETINGS.

**London and Middlesex Archaeological Society.**—A number of the members of this association recently paid a visit to the Church of St. Michael, Wood Street, under the escort of Mr. Philip Norman. Mr. Norman pointed out to the visitors several of the interesting features of the building, and his observations were productive of much food for reflection. On the 9th inst. the members assembled at the London Institution, under the chairmanship of Canon Benham, and listened to a disquisition by Mr. C. Welch (Guildhall librarian) upon the Roman remains recently discovered in Threadneedle Street in connection with the works of the Central London Railway. The pottery—comprising several large fragments of a broken amphora, together with two beautifully modelled vessels found inside—was placed on a table for the inspection of the members. Mr. Welch had experienced considerable difficulty in piecing all the available material together, but his efforts had resulted in a large measure of success, and the specimens—unique in many respects, and certainly of beautiful proportions—were inspected with keen interest.

**Society of Antiquaries of Scotland.**—The usual monthly meeting of the Society of Antiquaries in Scotland was held in Edinburgh, Mr. James Macdonald in the

chair. The chief paper, by Sir Arthur Mitchell, gave an account of a group of Bronze Age burials at Ardoch, near Bunnessan, in Mull. One of these graves, which he himself examined, contained a complete skeleton in good preservation, enclosed in a short cist. In two of the other graves Bronze Age urns were found. Three skulls were obtained and examined by Sir William Turner, who found that they were well-proportioned, and showed no sign of degradation. They were the skulls of young persons, probably of the female sex, and their capacity was equal to that of modern skulls of the female sex at the same period of life. Sir Arthur Mitchell, in another paper, treated of the distribution of cruse lamps, and the peculiarities of the contrivance for suspending them. He showed specimens from France, Italy, Germany, Holland, Spain, and other places, and stated that it was probable it would be found all over Europe and North Africa—in other words, all over the Roman area. He then discussed at length the curious contrivance of hook and spike which everywhere persistently repeated itself, and concluded by showing that exactly the same pattern appeared in the hanging arrangement of the lamps found in the ruins of Pompeii, in the catacombs of Rome, and in excavations made at Roman stations in England. He showed how this affected any conclusion which might have been drawn from a study confined to Scottish cruses as to what had suggested this form, and as to the purpose which it now or formerly had served.

**Sheffield Society of Engineers.**—A lecture was given recently at the Technical School before the members of this society on the "Deterioration by Fatigue in Steel," by Mr. Thomas Andrews. The chair was taken by the president, Mr. Thomas W. Sorby. The lecturer for many years past has made a special study of the various aspects of the loss of strength in iron and steel by reason of use. The information acquired in the course of these elaborate researches enabled him to formulate a specification for modern steel rails calcu-

lated to promote both durability and safety in rail service. These matters were fully described and illustrated in the course of the lecture. The lecturer, in treating of the causes of the loss of strength in steel rails, gave lantern illustrations of numerous rails which he has investigated. The difference between the loss of strength from mechanical abrasion and the deterioration of the ultimate crystalline structure of the metal under the fatigue of stress, consequent on the presence of internal micro-flaws, was shown. The effect of low temperature in reducing the impact resistance of rails, the influences of corrosion, and the manner in which vibratory stress induced microscopic internal growing flaws in rails, were also demonstrated.

**Dundee Institute of Engineers.**—Mr. Andrew Sproul, President of Aberdeen Mechanical Society, delivered a lecture in the Technical Institute on the 11th inst., under the auspices of the Dundee Institute of Engineers, his subject being "Glimpses of the Philosophical and the Practical in Engineering."

**Philosophical Society of Glasgow: Architectural Section.**—At a meeting of this Society, held last week, Mr. P. Macgregor Chalmers in the chair, a lecture was delivered by Mr. George G. Paton on "The Law of Scotland in regard to Mutual Gables." After referring to the origin and history of such gables, Mr. Paton dealt among other points with: Where they can be built; whose property they are when built; to whom, by whom, to what extent, and when the payment for the half built on the adjoining ground falls to be made; what operations as regards repair, re-construction, alterations, and additions can be made by one proprietor without consent of his neighbour. The lecturer pointed out that in burghs, and where there was to be a continuous line of building in a street, the privilege of erecting a mutual gable prevailed; that the true view seemed to him to be not that the builder of the gable is at first

the sole proprietor of it, or that the gable is at any time common property, but that each neighbour is from the first the proprietor of only the half built upon his own property with a common interest in the whole, though the one who has built the gable has a right to exclude the other using the gable until he has been repaid a share of its cost, and that this right was a real and not a personal right; that if the builder has disposed his property, his singular successor is the person who is entitled to receive payment when it is due, though in his conveyance there be no mention of the gable, and the claim on emerging is entitled to a preferable ranking should the adjoining owner be then bankrupt; that the obligation to pay transmits against singular successors; that there is a presumption that no payment has been made till use of the gable by permanent buildings has been taken, but, whenever payment has been made, the owner of the vacant ground is free to use the gable when he chooses, and were second payment to be made in error, repetition of it would be obtained; that where there is a contract to pay the half, the half is construed as the half of the whole gable, but where there is no contract, it would appear that he is bound to pay the half only to the height to which he builds; that where there is a contract, the presumption is in favour of immediate payment, but where there is no contract, payment is not exigible till use is taken; that each proprietor is bound to see after the repair of the gable, and in the case of urgency the one may act without the consent of the other; and that one proprietor may, without consent of the other, alter or add to the gable, provided no injury is done to the gable or to the neighbour's property. A vote of thanks was

accorded to Mr. Paton for his instructive lecture.

**Edinburgh Architectural Association.**—The Association, by permission of the Edinburgh School Board, visited on the 13th inst. the new school at Broughton, under the leadership of Mr. Robert Wilson, Architect. The school is built upon the site of Blackfield House, and consists of a central block with a wing at each side. The central block contains the principal class-rooms, entering from a combined boys' and girls' staircase, and in the wings are the teachers' private rooms and cookery and laundry class-rooms. There is a total accommodation for 1,358 children, provided at a cost of about £24,000, exclusive of the site. In the basement are situated the gymnasium, swimming bath, boiler house, and engine room. Externally the building is a very satisfactory example of School Architecture. The visit was brought to a close by a vote of thanks to Mr. Wilson.

**The Architectural Association of Ireland.**—A meeting of this Association took place on Tuesday, 16th inst., at the Grosvenor Hotel, Dublin. The president, Mr. R. Caulfield Orpen, in the chair. There was a large attendance of members. Mr. Frederick Batchelor delivered a lecture on "Hospitals and Hospital Construction," which we publish in the supplement to this week's issue. In the discussion which followed, Mr. George Ross, Mr. George Sheridan, Surgeon Jameson-Johnson, M.D., and others, took part. Mr. Batchelor, having replied, the proceedings terminated with a vote of thanks. The next lecture will be on March 2nd, when Mr. W. Kaye-Parry will deliver a lecture on "Drainage and Sanitary Construction."

## KEYSTONES.

THE Prince and Princess of Wales have fixed Saturday, May 22nd, at 3.30, for the opening of the Blackwall Tunnel.

WORK in connection with the reconstruction of the sheds destroyed by fire at Fairfield shipbuilding yard, and the repair and renewal of damaged plant, is proceeding rapidly. The company is already enabled to restart 1800 men, but about 1000 are still idle.

At a cost of £450 the Leeds Church Extension Society has secured a site for a proposed new Church on the Victoria Park Estate, midway between the Churches of Bramley and Kirkstall.

THE offer of Mr. Drummond, amounting to £2063, for the erection of new offices at Dunoon Pier, has been accepted by the Burgh Commissioners—the work to be completed within three months.

THE Public Health Committee of the Edinburgh Town Council has resolved by a majority to recommend the Council to empower the committee to get estimates for the erection of an hospital of 600 beds.

It is rumoured that a new opera-house is to be built in the suburbs of London. Several enthusiastic admirers of Wagner are, at any rate, considering a scheme for erecting a little theatre on the Bayreuth model within a few miles of London.

It is stated that the great loss of shingle which has taken place in recent years, along the foreshore between Folkestone and Dover, has been most marked since the construction of the pier at Folkestone. This has acted as a groyne, and the effect is shown in a remarkable way by the enormous accumulation of shingle which has grown on the west side of the pier.

Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

DEAR SIR,—Having taken in your valuable paper for many months, I have often wondered why you have never opened a few columns for students, say for building construction, model specifications, or constructional details, or such like. It appears to me that since the paper has been enlarged the opportunity presents itself very forcibly. Could you not spare say a column and a half weekly for one of these suggestions, which I think would make the paper worth a great deal more, and many of your readers would appreciate a move in this direction very much? Such articles that I have mentioned have appeared in both *The Builder* and *Building News*, I think. Hoping you will not think it presumptuous of me.

Believe me,  
Yours faithfully,  
STUDENT.

Hereford, February 20th, 1897.

[This suggestion shall receive every consideration.—Ed.]

Will some correspondent or our Editor kindly inform me the usual procedure in articling a pupil to an Architect. The usual number of years, salary given, cost of articles, and by whom is the expense borne.

PUPIL.

THE Poulton-le-Fylde Congregationalists have decided to erect a new Church to take the place of the present building, erected in 1809.

The Czar has ordered the expenditure from the Imperial Exchequer of 65,000 roubles for the erection of a residence for the students of the Women's Medical Institute recently established in St. Petersburg.

ST. ANDREW'S CHURCH, West Wrating, which has undergone extensive restoration at a cost of £1300, was re-opened a few days ago. The old-fashioned high pews have been removed, and the Church has been re-seated with pitch-pine benches. The roof has been substantially repaired, the pulpit and font restored, and a stained glass window has been placed in the chancel by the Frost family, of Wrating Hall.

KEYSTONES.

MR. WILLS, of the firm of Messrs. Price and Wills, contractors, Barry Dock, has already employed a number of workmen in connection with the new dry dock to be constructed for the Barry Graving Dock Company. These are chiefly engaged in preliminary excavations.

MESSRS. Reynolds and Eason have just sold by auction the Old George IV. Tavern, in Portugal Street, Clare Market, the scene of the Lowten incident in "Pickwick." After spirited bidding the property was disposed of for £7550.

MOTOR carriages driven by compressed air are to be introduced into New York in April next by the New York Cab Company. Compressed air as a motive power is free from the odour which some dislike in petroleum, and

its weight is practically nil, a fact which gives it an advantage over electricity, as well as gasolene. The dead weight of the air-holder cannot be so great as that of accumulators.

New gas offices in Leeds Road were recently opened by the Chairman of the Gas Committee of the Huddersfield Corporation. The Corporation has converted into offices several buildings which they bought some time ago from the trustees of Messrs. James Learoyd and Sons for £800. The premises are at the north-west corner of the gasworks, and the whole area taken over is 1542 yards. Between £500 and £800 has been expended in converting the premises into offices.

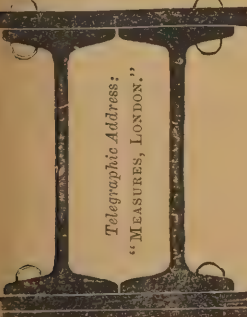

Trade and Craft.

HEAVY RAILWAY EXPENDITURE.

The Lancashire and Yorkshire Railway Company's estimates of the capital required in the event of their Bill receiving the sanction of Parliament shows total estimated expenditure £1,584,100, which, with the exception of £16,900, will be wholly expended upon widenings of their existing lines. Of this sum £357,000 will be spent on widenings in Yorkshire, £156,400 in Lancashire, and £1,053,800 upon fifteen miles of widenings extending from Todmorden in Lancashire to Brighouse in Yorkshire. The following are the details of the expenditure in Yorkshire: Widening from Bradley Wood to Heaton Lodge, near Mirfield, £48,600; at Mirfield, £131,600; from Dewsbury Junction to Thornhill, £29,800; from Horbury to Wakefield, £139,500; at Normanton, £7500; and diversion of Bird's Royd Road, Brighouse, £16,100.

PENRHYN QUARRY DISPUTE.

A mass meeting of quarrymen was recently held at Bethesda to consider the renewed invitation issued by Lord Penrhyn's agent to the men to apply for work at his quarries. Resolutions were carried declaring that Lord Penrhyn entirely ignored the principle for which the men were contending, that they were determined to secure the recognition of their legal right to carry on negotiations with the managers of the quarries, that they could not apply for work individually, and that they

were willing to submit all the points in dispute to be settled by the Board of Trade.

#### WAGES AND HOURS OF LABOUR IN 1896.

An article published in the "Labour Gazette" gives some particulars respecting changes of wages and hours of labour in 1896. It shows that the total number of separate individuals affected by changes in rates of wages during the year, so far as reported, was about 601,200. Of this number 375,000 received a net increase, 168,700 sustained a net decrease, and the wages of 57,500, although affected by upward and downward changes during the year, stood at the same level at the end as at the beginning. The estimated effect of all the changes on the weekly wages of the total number of workpeople affected was an average increase of 10d. per head. The particulars with respect to changes in hours of labour show that, though the net result of all the changes in 1896 was a decrease of nearly three-quarters of an hour in the weekly working hours of the total number of workpeople affected, the number whose hours were increased largely exceeded that of those whose hours were reduced. This is accounted for by the slight increase in the hours of labour recognised in the London building trades. This alteration, though very small, affected a large number of operatives, and nearly outweighs the decreases recorded in the building trades, so that the net reduction in this group of trades was very much less than in either of the three preceding years. So far as reported, the eight hours' day was conceded to about 1400 workpeople during 1896, of which number 900 were in the employ of local authorities. Particulars were received of three cases of reversion from eight hours to longer hours of labour, affecting 250 workpeople.

#### LYTE'S WOVEN METALLIC STAIR-TREAD.

This is a new material, which, from inspection, seems quite capable of sustaining its claims for durability and giving a good foothold. It is also easy to fix, as it simply requires to be nailed down on the tread, and can be readily bent over to form a nosing. It is composed

of lead rods about one-eighth of an inch diameter, each with a steel wire core. These are laid side by side, and woven together with plain steel wires of about 18 B.W.G. The lead is then partially flattened by rolling so as to make an even surface. We understand this material is being used and is giving satisfaction at the Army and Navy Stores, Harrod's Stores, Sloane Square Station, and elsewhere. It is also made with brass wire for ship use, and in either form should be very suitable for the steps of trams and omnibuses. Full particulars can be obtained from Messrs. Easton, Anderson, and Goolden, Limited, of 3, Whitehall Place, S.W., and the fact that it has been taken up by this firm is some guarantee of its value.

#### ELECTRICAL AND MECHANICAL EXHIBITION AT NEWCASTLE.

An Electrical and General Engineering Exhibition was opened on the 15th inst. at Newcastle. A spacious building has been erected in Northumberland Road, and has been filled with machinery and miscellaneous trade exhibits from the most eminent local and national firms, and even from Continental manufacturers. It is curiously interesting, in many features, to compare this Exhibition with that which was held on the Recreation Ground in 1887. The comparison suggests many useful object lessons. It is only by such a contrast that improvement is to be observed, and, though the interval is only a decade, the difference is striking. The advance that has been made is strikingly marked as to electrical machinery; and it is that which gives the Exhibition its chief interest. The display of electrical machinery is the best, by far, that has ever been seen, at one time in one place, in Newcastle. The mysterious power, with wonderful possibilities yet before it, is applied to all sorts of purposes that were not thought of a generation ago. In this display local firms have the principal place, and their exhibits are sufficient testimony to the enterprise of Tyneside firms and the skill of Tyneside workmen.

#### A DEFECTIVE ROOF.

At the Birmingham County Court on the 17th inst. an action was tried in which the Gospel Oak Iron Company, Limited, of the Mitre Works, Wolverhampton, sued Messrs. Smallwood and Co., brass and metal manufacturers, Montgomery Street, Sparkbrook, for work done and materials supplied in connection with the fixing of an iron roof over a portion of the defendant company's works. The original claim was for £82 1s. 6d., but as judgment was given in the High Court for £76 1s. 6d., the amount now in dispute was only £6, and the defendant company claimed this reduction on the ground that the roof had not been properly constructed, and admitted rain. It was stated on behalf of the plaintiffs that no complaint about the roof was made until they pressed for payment of their account, and subsequently a post-dated cheque was sent, which was returned because it was accompanied by a condition that the alleged defects should be remedied. It was only in exceptionally severe weather that a little rain found its way through the ventilating space at the top. Several of the employees of the defendant company gave evidence to the effect that on wet days a considerable amount of rain got through, as the ridge covering the ventilating space was too narrow. His Honour held that the roof was defective, and gave a verdict for the plaintiff for £3.

#### TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

## CONTRACTS OPEN.

### BATH URBAN SANITARY AUTHORITY. TO STONEWARE PIPE MAKERS AND OTHERS.

The Sanitary Committee of the above Authority are desirous of receiving TENDERS for the SUPPLY of GLAZED STONEWARE SEWER PIPES, GULLY TRAPS, &c., during One or Three Years, at the option of the Committee. The probable quantity required annually will be about 1000 feet of 12in., 4000 feet of 9in., 2000 feet of 6in., and a small quantity of 15in., 18in., and 24in. Pipes, with Junctions, Bends, Channel Pipes, and Gully Traps.

The Pipes, Traps, &c., to be of the best quality and make, supplied from time to time, in such quantities as may be required, and delivered into Dog-lane Corporation Yard, in Bath.

Tenders upon the printed forms to be obtained of the City Surveyor (no others will be accepted), sealed, and endorsed "Tender for Pipes," and addressed to the Chairman of the Sanitary Committee, to be sent in to the City Surveyor's Office, Bath, on or before TEN o'clock in the forenoon of TUESDAY, MARCH 2nd, 1897.

A sample 6in., 9in., 12in., and 15in. Pipe, 9in. Gully Trap (to trap not less than 2in.), also a Street Gully, the maker's name marked on each sample, to be deposited free of cost, at the City Surveyor's Office, Guildhall, Bath, before SATURDAY, FEBRUARY 27th next. For these 20s. will be paid, such then to become the property of the Committee.

The Contractor will have to execute a Contract to be prepared by the Clerk to the Urban Sanitary Authority. The Committee do not pledge themselves to accept the lowest or any Tender.

By order of the Committee,

CHAS. R. FORTUNE,  
City Surveyor.

Guildhall, Bath,

February 3rd, 1897.

The lowest or any Tender will not necessarily be accepted.

### ASYLUMS' COMMITTEE OF THE LONDON COUNTY COUNCIL.

TO BUILDERS AND CONTRACTORS.  
The Asylums Committee are prepared to receive TENDERS for the FOUNDATIONS of the Seventh County Lunatic Asylum, to be erected on the Horton Estate, Surrey.

d

## STIFF & SONS, LAMBETH, S.E.

MANUFACTURERS OF

BEST LONDON STONEWARE DRAIN PIPES AND FITTINGS,  
CHANNEL PIPES, KITCHEN AND HOSPITAL SINKS.

LIGHT'S, WEAVER'S, CREGEEN'S, KENSINGTON, AND OTHER TRAPS.

WATER CLOSET PANS AND TRAPS, URINALS, AIR BRICKS,  
DAMP-PROOF COURSE, ARCHITECTURAL TERRA-  
COTTA, VASES, &c.

For Illustrated Price Lists apply to

## JAS. STIFF & SONS, LONDON POTTERY, LAMBETH, S.E.

Instructions for Tender and forms of Tender and contract, with specification and schedule of prices, and other schedules thereto annexed, can be obtained from the Clerk of the Committee, 21, Whitehall-place, S.W., on or after FEBRUARY 1st, 1897, on payment of £5 for each copy, for which a receipt will be given, and the drawings can then be inspected at the office of the Architect, Mr. G. T. Hine, 35, Parliament-street, S.W., between the hours of TEN and FIVE. The amount deposited will, after the Committee have come to a decision upon the Tenders received, but not before, be returned to the tenderer, provided he shall have sent in a bona-fide Tender and shall not have withdrawn the same.

Tenders must be on the printed form, and be accompanied by the forms of contract and schedules thereto and bond.

The Tender and accompanying documents completed in accordance with the instructions, must be enclosed in

the authorised sealed cover, endorsed "Horton Asylum Foundations," and be delivered at the office of the Committee, 21, Whitehall-place, S.W., not later than TWELVE o'clock at noon, on MONDAY, MARCH 1st, 1897, after which no Tender will be received.

Any Tender not made on the printed form or not filled up and complete in every particular in accordance with the instructions will be rejected.

The Committee do not bind themselves to accept the lowest or any Tender.

The contractor will have to enter into a bond in the penal sum of £3000 with two approved securities each in the sum of £1500 as security for the due performance of the contract.

R. W. PARTRIDGE,  
Clerk of the Asylums Committee.  
Asylums Committee Office,  
No. 21, Whitehall-place, S.W.  
February 9th, 1897.

# JONES' REVERSIBLE SASHES.

NEARLY 200 OF THESE SASHES ARE USED AT KING EDWARD'S NEW GRAMMAR SCHOOL, NEW STREET, BIRMINGHAM.

This invention is most simple in its action; nothing is added to interfere with the original features of the sash and frame, and it is warranted not to get out of order.

No Springs, Pivots, or extra woodwork required.

The windows can be cleaned, the glass repaired and woodwork painted, inside the room.

The Fittings can be had from the Inventor, in Brass, 8s. per set.

Old Sashes can be made reversible, from 5s. extra.

In preparing new Sashes and Frames no extra cost is incurred.

These windows are most suitable for high buildings, and are a preventative against accident.

## DESCRIPTION.

Part of one inside bead is hinged, to allow the bottom sash to be taken out of frame.

Part of one parting bead is of brass or iron, attached to the pulley style with slot plates.

The cords are attached to lower part of sash styles, and act as centres to reverse the sashes.

Further particulars can be obtained by applying to the Inventor—

JAMES JONES, 317, Albert Road, Aston, Birmingham.

July 1	Designs for Water Supply, Elne (France)		La Mairie, Elne, Pyrénées Orientales.

## GREEN'S PATENT TRUINVERT PIPE.

AA—Holes for pouring in cement or composition.  
BB—the strengthened and Lengthened Socket.

CC—Inner Socket and Rest.  
EE—Chamber for cement or composition.  
FF—Stanford Joint in new position.

This pipe secures TRUE ALIGNMENT OF INVERT, INCREASED STRENGTH IN THE SOCKET, THREE GAS AND WATERTIGHT CONNECTIONS AT EVERY JOINT, and while allowing for a slight settlement when first laid, forms an ABSOLUTELY RIGID JOINT directly the cement sets.

## POINTS.

- 1.—GAS AND WATER-TIGHT JOINTS EASILY MADE UNDER WATER.
- 2.—TRUE ALIGNMENT OF INVERT.
- 3.—SOCKET THE STRONGEST PART OF THE PIPE.
- 4.—NO SPECIAL JUNCTIONS REQUIRED.

OATES & GREEN, Ltd., Halifax.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.

BY ALEXANDER DREW.

(Continued from page iv.)

No. II. OF SERIES.

IN taking up the real work of the series, the first points to be considered are the dead and live loads. The dead load is made up of the weight of covering and that of the framework itself, with occasionally such additions as that due to a ceiling supported by the trusses. The live loads, again, are those due to snow and wind, or to such accidental loadings as from swings in a gymnasium, or from shafting or hoists in a workshop, &c.

Taking the first, the dead or steady load, a table is here given in which are noted the average weights per square (of 100 sq. ft.) for various styles of covering, and also the minimum slopes at which these ought to be set; this table is compiled, with some slight modifications, from several text-books. It will be noticed that to those coverings which can be best and readiest laid with close and practically watertight jointings, are given the least slopes; while for such materials as slates and tiles, which cannot be so accurately and carefully jointed, considerably steeper slopes are noted, so that the rain may the quicker run off. The steepest slope of all is that given to thatch, where the rain must be made to find its way off at once, or leakage would certainly

Covering.	Weight per Square.	Minimum Slope.
Copper (.022 in. thick)	1 Cwt.	4°
Lead (5 to 8 lbs)	4 1/2 to 7 1/2 "	"
Zinc (13 to 16 zinc gauge)	1 1/2 to 1 3/4 "	"
Corr'd Iron (22 to 16 B.W.G.)	1 1/2 to 3 1/2 "	10°
Slates	5 1/2 to 9 "	21 1/2°
Tiles, when wet.	9 to 15 "	26 1/2°
Boarding (per 1" thickness)	3 "	"
Timber Framing {for Slates or Tiles}	5 to 6 "	"
Thatch (average)	6 "	45°
Asphalte felt	1/2 "	4°
1/4" Glass & Framing	3 "	15°
Lath & plaster Ceiling	9 "	"

take place. Asphalte felt is noted at a very flat slope, because it is almost invariably painted or tarred over after being laid, thus insuring tight joints. Several tables give a minimum slope of about four degrees for corrugated iron, it is here noted as ten degrees, the reason for this change being that it is very difficult to form really close joints with this material, on account of the irregularities which are always met with in the several corrugations.

Keeping clear for the time being of all-iron coverings, which will fall to be considered later on, there should be no difficulty, with the help of the table just given, in determining

the total weight of the covering to be supported by the roof trussing, for with the distance apart of the trusses settled, and the pitch or length of the slopes decided on, the total area to be carried by one truss, and the consequent weight of the same, is a simple matter of calculation.

Coming now to the question of the live or moving loads, that due to snow is of comparatively little importance in this country, for when the roof is subjected to very heavy wind-pressure, the snow would almost invariably be blown off altogether. It is a very frequent practice to make no allowance whatever for snow loading; but should this be considered desirable, 2lb. to 3lb. (certainly not more than 5lb.) per sq. ft. is more than ample. Of course, should the formation of the roof be such that there is a possibility of snow collecting at any point to a dangerous extent (such as in the valley of a double-span building, or behind some parapet wall), allowance would then, of course, be necessary. Freshly-fallen snow weighs only about one-tenth that of an equal bulk of water; but if this lies for some time, and particularly if it be subjected to alternations of thaw and frost, it may become considerably solidified, and its weight in this way much increased. It is very unlikely, however, that anything above 12lb. per sq. ft. allowance need be made, even under conditions of this nature.

In the case of wind-pressure, authorities differ very considerably. It is said that a pressure of 90lb. per sq. ft. has been registered at Bidston, near Liverpool, but this is extremely exceptional, and is no doubt largely due to the configuration of the ground in the neighbourhood of the Observatory. At the Edinburgh Observatory the wind-pressure

A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the "Builders' Journal."—Ed.

seldom exceeds about 25lb., while in Glasgow the maximum noted has been 47lb. per sq. ft. At the Forth Bridge again, during its construction, wind-gauges were erected on the Island of Inch Garvie, on which the centre pier of the bridge now rests. Of these the largest was 300 sq. ft. in area, and it carried two smaller gauges on its surface, each about 18in. diameter; one in the centre and the other at the right-hand top corner, when facing the gauge. Near to this large gauge a smaller one was set (both of these being fixed and facing in the same direction), while a third, similar to this last was also set near. It however was arranged to revolve, and always faced in the direction of the wind. Notes were kept for about seven years of the pressures recorded, and leaving out of account two cases in which it was proved that the registering arrangement had become deranged, the highest pressure on the revolving gauge showed only 35lb per sq. ft.; on the small fixed gauge on three occasions the pressure rose to 41lb., while in the case of the large fixed gauge, only on one occasion was 35lb. registered; on another 27lb.; while on all others the pressures were considerably lower. As an indication of how much this pressure may

—Types of—  
—ROOF COVERINGS.

vary at different points on a reasonably large surface, it was noted on one occasion that while 19lb. per sq. ft. was the average pressure for the whole surface (of 20ft. by 15ft. or 300 sq. ft.) the centre gauge indicated 28½lb., while the corner one registered 22lb. per sq. ft. As a further proof of this uneven distribution of wind-pressure, it might be noted that while the bridge was being constructed, two revolving gauges were set up on each of the supporting towers, and readings on these compared with one another; it was frequently found that a difference of 10lb. to 12lb. was indicated, sometimes the one gauge and sometimes the other showing the higher pressure. According to the Board of Trade regulations, 56lb. per sq. ft. is recommended for use in calculating the strength of bridges, &c.; but when it is considered that 35lb. to 40lb. per sq. ft. distributed over the side surface of any ordinary railway carriage in use in this country will overturn the same, such an allowance as 56lb. will be admitted as too high for ordinary requirements; in practical use 40lb. should be ample.

These various pressures are taken as acting on a vertical surface, or one set at right angles to the direction of the wind; but when the action takes place on an inclined surface, the result is, of course, different. What is made use of in calculating the strains on roof framework is the *normal pressure*; i.e., the equivalent pressure acting at right angles to the slope of the roof covering. Tables of this

pressure for varying slopes, and more or less complicated formulae, are to be found in various books, but the simple diagram here shown (Fig. 1) will be found much more convenient, and quite accurate enough for practical purposes. On the left is shown a series of slopes varying from five to sixty degrees, on the right is drawn the curve of normal pressure. In using this diagram it is only necessary to note the particular slope under consideration, find the point in the curve level with the upper end of this slope line, and dropping the eye vertically downwards, read off the multiplier there noted; the assumed wind-pressure multiplied by this number will give the actual normal wind-pressure required. Thus if the slope be 30 degrees the multiplier is practically 65, which for 40lb. wind-pressure, gives 26lb. per sq. ft. as the required normal pressure.

It is undoubtedly true that the configuration of the ground will alter the direction of the wind, and, to a certain extent, in this way modify the normal pressure on the roof; in some cases even increasing the actual pressure from that calculated by the table; but it is also true that if the roof be supported on a wall of reasonable height, this will generally reduce the normal wind-pressure by apparently deflecting the current upwards and over the slope. For all practical purposes, however, such refinements cannot be considered, and the totals given by this table will be found sufficiently accurate for all general purposes.

Being now in a position to determine the total dead and live loads to be supported by the roof-framing, the next point of importance is the question of how these loads are transferred to the trusses; Figs. 2 to 7 illustrate the usual variations in this. Fig. 2 shows an arrangement which is seldom adopted; the trusses are placed comparatively close together, say from 5ft. to 7ft., and the sarking, running longitudinally, is nailed directly to a

strip of wood fixed along the top of the rafter; in this way the load is distributed along the full length of the rafter. In Fig. 3 is shown a series of timber purlins set comparatively close together, and carrying vertical sarking; here the load is transferred to the rafter at a number of points. Fig. 4, again, indicates an arrangement of heavy timber purlins placed wide apart, supporting in their turn jack rafters and longitudinal sarking; the load points are in this case few and wide apart. Fig. 5 shows an arrangement almost identical with the last, but for an all-iron covering, while Fig. 6 is practically an intermediate position between that of Figs. 2 and 3, the small iron or steel purlins being placed about 9in. to 15in. apart, and the covering of slates or special tiles tied to these by means of copper wire. This latter arrangement is frequently used abroad where timber may be scarce or liable to decay, or to the attack of

the white ant, or it may be used to form a fireproof roof. In Fig. 7 is indicated a ventilator: in such a case as this its weight would be calculated separately, the one half being taken as acting at each point of contact with the rafter, while the wind-pressure on the same would be allowed for, as will be shown later on. The variations in the stress due to these several modifications in arrangement of roof covering will be treated later on, so that no further reference need at present be made to these figures.

The next point for consideration is the methods by which the stress on the various members of a roof-truss may be determined, and for practical purposes only two are at all made use of—the *Graphic or Stress Diagram Method* and the *Method of Moments*. To understand these, it will be best to begin by a brief statement of the general principles of Graphic Statics. Statics is the particular branch of Kinematics which treats of the effects or actions of forces which tend to balance one another, or to keep the structure on which they act at rest. This, of course, is the condition in which we wish our framing to remain. Whatever loads or forces may act on our roof-framing, it must be designed to safely resist these. A force is generally defined as that which causes or tends

to cause motion in a body on which it acts; but while one or more forces may have this tendency, it will be readily seen that an additional force might be applied, or the existing forces might be re-arranged, so that their combined actions would balance or neutralise one another. In treating of forces graphically or by the drawing of lines, it is necessary to see first how a force can be represented. There are three points which must be known before a force can be said to be fully understood—its magnitude, its direction, and its point of application. Now, a straight line can be drawn from any given point, and in any given direction, and if its length be drawn to any scale proportionate to the magnitude of the force it is desired to represent, this line will almost fully represent that force, the one point yet in doubt being the direction in which the force acts; this latter point is generally indicated by placing an arrow-point somewhere on the line. Thus, Fig. 8 will clearly represent a force of, say, 4lbs. (being drawn of a length proportionate to 4), acting at a point X, and in the direction X Y.

If it is desired to add together two or more such forces, no difficulty need be experienced so long as these are acting in the same straight line, for it will be self-evident that should they be all acting in the one direction it is only necessary to add their values together; or if this be done graphically, to draw in succession

lines representing in length and direction each of these forces, beginning each succeeding line where the previous one ended. Should some of the forces be acting in opposite directions to the others, they still may be added together

algebraically, all acting in one direction being added, and all acting in the other direction being also added together, and the less subtracted from the greater; the result gives the value of the sum of the several forces, the direction of action being, of course, that of the larger sum. Should it be desired to show this graphically, it is done by drawing in succession all the forces acting in one direction, and from the finishing point of these drawing backwards in succession the various opposite forces. The line joining the finishing point with the starting point will then represent to scale the sum of the several forces.

When the forces under consideration do not act in the same straight line, the method is different, but equally simple. In Fig. 9 is shown two forces (X A and X B) acting at the one point X. To determine the value of a single force, which would have the same effect as these two forces acting together, it is only necessary to complete parallelogram X A C B, and draw the diagonal X C; this latter to the same scale as the forces X A and X B are drawn will give the value of the single force required. By reference to Fig. 10 it will be seen that this operation may be still further simplified, for it is only necessary to begin at any point Y drawn in succession Y A and A C parallel and proportionate to the two forces; then, by joining C and Y, the same result is arrived at as before. The first method is generally spoken of as the *Parallelogram of Force*, the second the *Triangle of Forces*.

There is a point here which should be carefully noted: in the case of these two forces it is possible to determine a single force which will have the same effect as the two separate forces acting together; but if this is so, it will be readily understood that another force, equal to this single force, but acting in the opposite direction, will not only balance this single force, but would equally balance or neutralise the two original separate forces. To the first in these single forces is generally given the name of *resultant*, and to the latter, the *equilibrant*, or *balancing force*: this latter is the one which is made most use of in statics. Referring to Fig. 9, the direction of action of the single force required to balance the two separate forces is that shown by the arrow-point, that is to say it is acting from C to X. Now in drawing the triangle, Fig. 10, if the several lines are drawn continuously till the starting-point is returned to (that is Y to A, A to C, and finally C to Y), the direction in which the last, or closing line is drawn will give the direction of action of the equilibrant or balancing

force: this point should be very carefully noted, as its value will be apparent later on. It is also worth noticing at this point, that these three forces under consideration are in equilibrium, or balanced, and they can be represented in direction and magnitude by the three sides of a close polygon: this is true in all cases of balanced forces acting in the same plane at one point. Fig. 11 represents four forces acting at one point, X, the irregular dotted figure to the right represents each of these four forces drawn in succession from a starting point O, O A being proportionate and parallel to the force X A; A B to force X B; B C to X C; and C D to X D. To complete or close in this polygon, the line D O is necessary, and this to the scale used in representing the other forces will give the equilibrant or balancing force. In this system of four forces the direction in which the last line is drawn, that is from D to O, gives the direction of actions of this equilibrant, which is shown by a light line, O X. The *Polygon of Forces*, as this method is generally called, may be used to determine the equilibrant for any number of forces acting at a given point.

Thus, in any system of forces acting in the same plane at one point, if the lines representing the several forces do not close, this system is not in equilibrium, and will require the addition of an extra force which is represented in direction and magnitude by the line required to close the polygon to produce equilibrium.

It is occasionally necessary to make use of another consideration in treating of forces, and that is, that for purposes of calculation we may consider a force as acting at any point along its line of action. Thus if a man be pulling a waggon by means of a long rope, the effect will be the same whether he pulls close up to the waggon or at a considerable distance therefrom; neglecting, of course, the weight of the rope. To illustrate this point, Fig. 12 is intended to represent a beam of wood lying on the ground, to which two ropes were attached, as at A and B. To each of these ropes a force of 30lb. and 24lb. respectively is applied; to determine the combined effect in this case, the dotted lines A X and B X are drawn, and the two forces of 30lb. and 24lb. are assumed as acting at the point of intersection X. The parallelogram of forces may be drawn here, exactly as represented in Fig. 9, and if the diagonal X C be drawn, its length to scale will give the resultant of the two separate forces, and the point where this line intersects the centre of the wooden beam will give the point at which a single rope would require to be fixed, so that when pulled with a force proportionate to the diagonal X C, the beam would act exactly as if under the influence of the two separate and simultaneous forces A and B.

There is another effect or influence which a force may exercise on a body. It might tend to turn the body round a particular point or axis; this is called the *Moment of the Force*. Thus in Fig. 13 the force A, acting at a perpendicular distance l from the point X, would have a moment equal to  $A \times l$

This is best illustrated by thinking of a man turning a winch-handle; the pressure or effort he applies to the handle, multiplied by the length (or leverage) of that handle, will give the moment or turning tendency which he exercises on the spindle. If the pressure he exercises diminishes, the turning tendency or moment will also diminish; or, again, if the length of the handle (or leverage) diminishes, the moment will also diminish. Thus it will be seen that the value of the moment is directly proportionate both to the force and to the leverage. If the force diminishes to nothing, the moment is also reduced to nothing; and equally so if the leverage be reduced to nothing—that is to say, if the point round which the moment is considered be in the line of action of the force, the moment again becomes nothing or disappears. Moments are said to be *right-handed* and *left-handed*, as they tend to turn the body round in the one direction or the other; and two equal moments acting at the same point and in opposite directions will, of course, balance one another. For example, Fig. 14 represents a beam balanced at a point R, and carrying two forces, P and Q, at its two extremities; so that this beam may be balanced at the point R, it is necessary that the moment of the force P about that point be equal to the moment of the force Q about the same point, or

$$P \times x = Q \times y \quad \dots \quad (1)$$

This distance x and y must be measured at right angles to the line of action of the force. The pressure on the point R, or the reaction at that point, is of course equal to  $P + Q$ . Taking advantage of the fact previously noted, that the moment of a force about any point in its line of action is equal to zero, it is an easy matter to calculate any of the three forces noted in Fig. 14, if the value of one or both of the others is known. Thus, given Q and R to determine P, it is only necessary to take the turning-point in the line of action of R, thus getting rid of its moment, when the undernoted formula will give us P.

Equally, if Q is to be determined the same turning point is taken, and the second formula given below is used. Should P or Q be known, and the value of R wanted, the turning-point may be taken in the line of action of Q or of

P, making use of the formula as below noted.

$$P = \frac{Q \times y}{x} \dots \dots \dots (2)$$

$$Q = \frac{P \times x}{y} \dots \dots \dots (3)$$

$$R = \frac{P \times (x + y)}{y} \dots \dots \dots (4)$$

$$\text{or } R = \frac{Q \times (x + y)}{x} \dots \dots \dots (5)$$

The application of the principle of the parallelogram, or triangle of forces (previously described and illustrated in Figs. 9 and 10) to the determining of the stresses in the various members of a roof-truss, is comparatively simple; but before entering on this subject there is one point which should be noted. The various members of a roof-truss may be roughly divided into two classes, *Struts* and *Ties*, the one being called upon to resist compression, and the other tension. There is one axiom in statics which runs: *Action and reaction are equal and opposite.* This may be simply illustrated as follows: If a short block of wood be set upright on a table, and a weight placed on top of same, this block will require to push upwards against the weight with exactly the same force as the weight presses downwards on it, if equilibrium is to be maintained. In the same manner, the lower end of the wooden block must press downwards on the surface of the table with the same force which it exerts upwards against the weight, and, of course, the table itself offers an equal and opposite resistance to the lower end of the block. Thus the action of the block in pushing upwards at the one end is exactly equal to the reaction which it exerts in the opposite direction at the lower end. Again, if a weight be suspended by a cord from a hook inserted in the ceiling, this cord will pull the weight upwards with exactly the same force which the weight exerts in a downward direction, and the cord will at the same time tend to pull the hook downwards with the same force which it exerts upwards against the action of the weight. To readily represent these two different kinds of stress, it is best to place arrow-points on the lines representing these forces in the manner shown in Fig. 15, and it will be noticed that these arrow-points indicate the direction of action of the member itself: a strut tends to push outwards at its two extremities, while a tie acts in the opposite manner, and tends to pull inwards towards the centre. These signs are specially made use of in drawing graphic stress diagrams, as shall be presently seen.

To illustrate the manner in which Stress Diagrams are drawn, Figs. 16 and 17 are here produced. The first deals with the Dead Load Stresses alone, while the latter takes note only of the Live Load Stresses. Considering the first in detail (and leaving out of account for the time being the manner in which the values of the various loads are arrived at, noting, however, that for present purposes all the forces are taken as acting at one or other of the several joints), it will be noticed that at the various points where the several members intersect one another, and at some of which the forces noted also act, the various stresses must be such that they balance one another, or produce equilibrium—that is to say, if these forces were known, and were drawn in succession to scale, they would produce a closed polygon (as previously explained in dealing with Figs. 10 and 11). But a little consideration of the remarks previously made with reference to Figs. 8, 9, 10 and 11 will make it clear that it is only necessary that we know some of these forces to enable us in certain cases to determine the unknown ones. For example, if the point of intersection of rafter and tie at the shoe be considered, there is here two known forces acting in the same straight line, which may be at once combined, with the result that one known force is left, acting vertically upwards. To balance this, there is a certain stress produced in the rafter and in the tie, and we know the directions in which these two unknown forces act, which, of course, must be that of the direction of the two members themselves. By drawing a simple

triangle in which the three sides are respectively parallel to those two members, and to the known vertical force, this latter side being to a scale proportionate to the value of this force, we are enabled to measure off to the same scale the desired forces acting in rafter and tie. In this way it is only necessary to go over the truss, considering each joint in succession, and making use, where necessary, of the forces previously determined to work out the stress on all the members. This process is actually that gone through in producing the diagram shown in Fig. 16, except that instead of drawing each polygon separate, they are all combined into one complete diagram. In drawing such a figure the same principle is gone on, whatever the type of truss and loading may be, so that a careful and detailed examination of a simple type such as shown should almost be sufficient to illustrate the whole principle.

(To be continued.)

### AN ARCHITECT'S COPYRIGHT IN HIS DRAWINGS.

IMPORTANT CASE.

Neale v. Harmer and others.

The following is a case as reported in the "Times" of the 13th inst. :—

IN the High Court of Justice (Chancery Division), before Mr. Justice Kekewich, Mr. James Neale, Architect, applied by motion for an interim injunction to restrain the defendants, Harmer and Harley, and "Architecture (Limited)," the publishers and proprietors of a monthly magazine "Architecture," from printing and publishing any copies of that magazine containing any drawings taken from the plaintiff's work "The Abbey Church of St. Alban." In 1877 the plaintiff published, by private subscription, a large and elaborate work under the above title, containing about 200 architectural drawings of the details of St. Alban's Abbey in its original state before the recent restoration, together with descriptive letterpress. The work was duly registered as copyright. The editor of "Architecture," being desirous of publishing an article in his magazine upon St. Alban's Abbey, some correspondence took place between him and the plaintiff, the result of which was that the plaintiff gave the editor permission to copy the ground plan of the Abbey from his work, but, as the plaintiff contended, declined to allow him to use any of the drawings unless he (the plaintiff) himself wrote the article. The defendants, however, in the January number of their magazine for the present year, published a long article upon the Abbey, illustrated, not only with the ground plan, but also with three reduced drawings from the plaintiff's work. To these were added illustrations of the so-called "restorations." This article described the Abbey as "an example of what restoration at its worst can do," and as "unfortunate alike in those who built it, and in the amateur Architect who has been allowed to wreak his will upon its massive and clumsy frame." It then proceeded to severely criticise the "restoration." The article had been continued in the February number of the defendants' magazine, but, in consequence of the plaintiff's complaints, without any copies of the drawings in his work, though it was said that the defendants had intended to take several more of his drawings. Mr. Warrington, Q.C., and Mr. Pattison appeared for the plaintiff. Mr. Upjohn for the defendants did not deny that the three drawings in question had been taken from the plaintiff's work, but he contended that his clients had, in fact, obtained a licence to copy the drawings, and in doing so had not gone beyond what was honest, fair, and reasonable. A man writing upon a subject of artistic or scientific interest was bound to notice and deal with previous works upon that subject. This magazine was intended rather for a limited class of persons, Architects and Archaeologists, and in the article complained of the writer proposed to show the extent to which a beautiful building of great archaeological interest might be spoilt by the hands of the ruthless restorer, referring to a well-known gentleman

whom he would not name.—Mr. Justice Kekewich: You need not hesitate to mention Lord Grimthorpe, for his name is in the affidavits. Lord Grimthorpe is quite capable of taking care of himself.—Mr. Upjohn: I am glad I have not Lord Grimthorpe to deal with here. Upon the merits of the present case there was no evidence of the *animus furandi*. It had been decided by the authorities that taking extracts from a work for the purposes of criticism was not piracy. A man was entitled to make a fair and reasonable use of a published work, and the defendants in this case had not exceeded that right, for they had not done anything to destroy or diminish the value of the plaintiff's work or the profits of it. Therefore there had been no infringement. But even if the Court should hold their had been an infringement, it would be a hardship on the defendants to grant an injunction, for that would prevent them from enabling purchasers of later numbers to make up a complete volume by purchasing the January number. He would, however, undertake to keep an account of all sales until the trial.—Mr. Justice Kekewich said that the editor of "Architecture," being anxious to obtain drawings of the old as well as the new part of St. Alban's, wished to do so cheaply, and applied to the plaintiff, the author of this work, which was stated to be a standard work. With regard to the question of licence, he would assume for the moment that there had been no licence. It was said that these three drawings came directly from the plaintiff's book; and that was not denied. Apart from the question of licence, that was entirely wrong. The plaintiff's book was not referred to in the article at all, and his Lordship could not conceive, apart from the question of licence, what right the defendants had to take these drawings and incorporate them in an original work of their own. It was said that three drawings did not form a material part of the plaintiff's work. In one sense that was true. The plaintiff's work was a large one, and it was a very learned work. The test was not so much what proportion of the plaintiff's work had been taken, but rather what proportion of the defendant's work was the plaintiff's; and, turning to the January number of the defendants' work, his Lordship found there were three drawings of St. Alban's, and that all these were taken from the plaintiff's work. The only strictly Architectural examples of the old Abbey were these three drawings. The defendants were availing themselves of the plaintiff's industry and knowledge, and were not exercising any ingenuity of their own, except in copying the plaintiff's work. That, in his Lordship's opinion, was entirely wrong. Then it was said that, with regard to the question of licence, there was a conflict of evidence which he ought not to deal with now. The story of the case, taking the affidavits and correspondence together, appeared to him to be perfectly plain. The plaintiff was applied to, to allow these drawings of his to be used, and he said, "You may use the ground plan, but nothing more." The defendants applied to him again, and he objected to his drawings being used unless he wrote the article himself. He offered, for a certain price, to write the article and to illustrate it. The defendants said that he offered to allow them to take the illustrations at a certain price, but that he did not offer to write the article; but it was impossible to put that construction upon the correspondence. What he said was, "I will write the article, and I will illustrate it." Upon the whole, his Lordship held that the plaintiff was entitled to an injunction as asked, until the trial or further order; but the injunction would not extend to the ground plan.

### NOTICE.

THE articles on Workhouse Planning and the Planning of Small Houses will be continued in our next issue. In the first article on the Planning of Small Houses it was stated: "No. 1—A Terrace House at £70." This should of course have read: "Cube at 1d. = £70."

## IMPORTANT NOTICE.

From a number of enquiries from the Architectural Profession and from Advertising firms, it would appear that some uncertainty exists as to whether or not a publication called "Architecture," against which Mr. James Neale, an Architect, obtained an interim injunction in the High Court of Justice, Chancery Division, before Mr. Justice Kekewich, on the 12th ult., is the same publication as "The Architectural Review," or in any way connected therewith.

The proprietors of "The Builders' Journal" (weekly) and "The Architectural Review" (monthly) beg to state that their publication "The Architectural Review" is not the publication against which the interim injunction was granted, and that they are in no way connected with the offending publication.

The misapprehension no doubt has arisen from the fact that originally the proprietors of "The Builders' Journal" published a publication called "Architecture" for the proprietor, but they ceased to have any connection with it about twelve months ago.

### Another Unsatisfactory Competition.

THE adjudication in the competition for the Longton Technical Schools and Free Lib-

rary, the foundation stone of which was laid by the Prince of Wales in January last, has resulted in the first and second premiums being awarded respectively to the designs labelled "Knowledge" and "Compact," the authors in each case being Messrs. Wood and Hutchings, of Tunstall. These plans were selected by the Assessor, Mr. W. Gilbee Scott, principally on the ground of economy, he being of opinion that many of the schemes submitted could not be carried out for the stipulated amount, viz., £8000. Much dissatisfaction prevails as to the Assessor's decision, especially among those competitors whose designs cube out to less than the premiated ones, the estimate for which is priced out at 4½d. per foot for the main building and 4d. for the back portion. No mention is made of boundary walls or fences. The plan "Knowledge" has many faults which are calculated to remove any impression as to merit having been taken into account in the selection. One entrance, 9ft. wide, leads to the whole building; on the right of this is the borrower's space and lending library, with the reading-room entirely disconnected on the other side, thus preventing any supervision whatever over this room. The entrance abruptly diminishes to a tunnel, 6ft. wide and 47ft. long, conducting to the whole of the remaining departments. No lavatory accommodation has been provided for the library department, although required by the conditions. Possibly this may come under the convenient heading of "future extension." The chemical laboratory is placed in the basement, notwithstanding the fact that there is plenty of land available. The lighting arrangements are distinctly bad and ill-considered, the space for borrowers would have its darkness relieved only by what little light might struggle between the bookcases of the lending library from the windows on the further side, and thence through the space between the indicators on the counter, and through the glazed screen from a window on the adjacent staircase. The reference-room would be far from light, while the Art rooms are lighted principally from the south-east and south-west, no direct north light being obtained. It is nothing new to find a certain amount of "fudging" pass muster in competition perspectives; roofs are "pitched up," chimneys "nudged" into convenient positions, and the figures in the foreground dwarfed to a ridiculous size. The writer recently saw a competitive sketch for a public building

showing a letter-box with a bearded individual walking by, whose hat was distant three courses of Ashlar from the slit. These and many others are common dodges with the "artist," who will undertake to evolve an "eyeable" sketch from your senior pupils' crude elevations; but in this case a block of buildings, containing the lecture-hall, which could not possibly be seen from the station point, is brought into a conspicuous position on the same plane as the main block, presumably to add breadth to the composition. Flues are shown on the plan also, which have no corresponding stack on the elevations. It is decided that the premiated designs shall be submitted to the Technical Instructor to the County Council of Stafford, and to the Science and Art Department, before anything further is done.

118ft. high—a total of 230ft. These piers have sunk panelled work, with trefoil heads; the height to caps is 30ft. and round the caps is cut an inscription from the "Te Deum." The ceiling is formed by oak beams in panels, richly decorated. The nave has a clearstory of ten square headed windows on each side; the aisle windows are of four lights, varied in design on north and south; the west window is of seven lights, 20ft. 6in. across and 28ft. high, and the east window of seven lights 25ft. high and 21ft. across. Over the east window is a niche with figure of St. George—the dragon forming the corbel below figure. The nave and aisles, morning chapel and organ truss, vestry and porches, have open timber roofs of oak handsomely carved. The drop rafters of nave roof are received upon the caps of the shafts which run up from the face of the nave piers; the nave walls above the arcades are sunk

ST. GEORGE'S, HEAVILY, STOCKPORT. WEST END. FROM A PHOTOGRAPH BY J. W. BUCKLEY, STOCKPORT.

### A New Church dedicated to St. George, Heavily, Stockport.

The magnificent Church, dedicated to St. George, Heavily, Stockport, which has been designed and carried out under the superintendence of Messrs. Austin and Paley, Architects, of Lancaster, was opened on Thursday, Feb. 25th. The contracts were signed in Dec., 1891, so that the erection and completion has occupied a period of five years. The Church is situated in Wellington-road, and is designed in the transitional period of Decorated to Perpendicular Architecture. Of almost Cathedral-like effect, it consists on plan of a nave, 112ft. long by 29ft. wide, and 50ft. 6in. high to wall plate; north and south aisles, 19ft. 3in. wide, and 31ft. high to plate; chancel, 68ft. long by 28ft. 6in. wide, of equal height as nave; morning chapel, on north side, organ transept, on south, and vestries. The total length of the Church is 180ft., and the width across aisles and nave, 75ft. At the crossing of nave chancel and transepts are very massive piers, carrying a tower 112ft. high, which is surmounted by a spire

panelled, similar to the Old Coventry Church work. The chancel is groined in stone, with carved bosses of foliage and figures at the junctions of the ribs. The pulpit is of stone, and is built solid with and against the south-west crossing pier; it is semi-hexagonal, and springs from a panelled shaft and base with ribs, the sides being panelled and containing niches with pedestals and figures under canopies, with foliage band running under the moulded cornice. The wing wall is joined to a low screen wall of stone divided by shafts and bands into panels, with tracery heads, surmounted by moulded coping. The font, which is of alabaster, is placed at the west end, and stands upon a well-elevated octagonal platform of Runcorn stone of three steps. The bowl is entirely carved with leaf foliage springing from angle bosses; it is carried by a central shaft with an open arcade round it, and only needs a fine cover to make it perfect. The reredos is entirely of alabaster; the central portion, which stands 18ft. high, is divided into three widths by buttressed towers with canopy tops, the centre panel being the wider,

ST. GEORGE'S, HEAVILY, STOCKPORT. INTERIOR FROM WEST END.

and containing "the Crucifixion" with canopy work above. The two side-panels are subdivided, and contain figures of bishops standing upon pedestals under canopies, the whole surmounted by a battlemented cornice with tracery, paterae, and inscriptions. The shelf is carved with groups of foliage, with the inscription "Sanctus" between; above same are nine panels with delicately carved foliage heads; and the inscription above, running across reredos, "Per pretiosam mortem et crucem tuam, libera nos Domine." The side wings to reredos are canted inwards, and have open archways, giving access to the ambulatory which connects the morning chapel with vestries, and an open arcading with moulded and carved coping on the top of this, and at ends of centre portion are niches containing figures of two bishops. The choir-stalls are of oak, richly carved; the elbows to boys' seats have traceried panels with carved paterae round, and poppy heads containing figures of the Blessed Virgin and Child, St. Michael, &c., amongst the foliage. On the buttresses are seated figures of David with harp, Miriam with timbrel, Tubal Cain and pipes, &c.; on the prayer desk elbows the poppy heads are figures of bishops flanked by angels holding shields. The clergy stalls have "lion's couchant" on elbows, and the men's carved spandrels. The fronts to prayer desk and choir have linen panels with roses and shields in centre, divided by traceried and buttressed mutins, the whole surmounted by a cornice of angels praying, and angels holding shields and scrolls respectively. The stalls stand upon a deep stone sill with sunk tracery band. The organ case, of oak, stands in the south transept, the console being detached and placed on a raised sill immediately behind the choir. It is blown by an hydraulic engine placed in a special chamber below. It is 30ft. high, and has rectangular towers projecting from the front corners, with semicircular front corbelled out on to the ogee-shaped corbels of the towers.

entire Church and morning chapel wherever seated. The east window contains figures of our Lord in majesty in centre, with St. Michael and St. George and Cherubim and Seraphim in side lights. Above, in the tracery, are the mounted figure of St. George and the Dragon—symbol of the good fight—and figures of Fortitude, Justice, Faith, and Charity, and the spirits of the seven lamps before the Throne. The west window contains figures of Solomon, Job, Isaiah, St. John Baptist, Habbakuk, Enoch, and David in lower portion of lights; and in upper portion emblems of Spirits of Wisdom, Understanding, Counsel, Ghostly Strength, Knowledge, True Godliness, and Holy Fear; in the tracery, Pison, Gibon, Tigris, and Euphrates, and the figures of Peace, Long-suffering, Meekness, Temperance, and Chastity. The main altar rails are of oak, with large turned and square balusters at intervals, filled in between with balusters of copper bronze, giving a very rich effect. The top rail is carved with flowing patterns of tracery and carving, with the emblems of the Crucifixion cut in the panels over the large balusters. The one in the morning chapel is

The centre portion next chancel projects with splayed angles, which contain niches with figures of angels playing musical instruments. In the centre of this front is a large semi-circular projecting tower. The western portion is covered over facing the chancel. The pipe shades and heads of panels are richly carved with the rose, vine, pomegranate, &c. The whole is surmounted by a moulded cornice and deep cresting, with turned posts at the angles. The lower portion of the framing has three-quarter turned balusters attached at angles, and linen panels. The morning chapel reredos is of oak, divided by traceried mutins into three panels, the centre containing large carved cross with shield and I.H.S. standing upon a base, and the sides figures of John the Baptist and Isaiah standing upon pedestals. Round each panel in the simple hollow moulding roses are carved at intervals. The moulded outer frame is raised in centre with ogee-curved top forming pediment, a broad band of the vine ornament running round the cornice and pediment of reredos. A panelled and moulded dado, 6ft. high, runs round the

similar, but with wide traceried posts in place of large balusters, filled in between with balusters of oak. The altar tables are of oak, with linen panels and traceried posts—that in the morning chapel has been made by Messrs. O'Kell and Sons, of Stockport. The roofs, seats, and all fittings throughout are of oak. The nave and chancel roofs are covered with slates of a warm brown colour, and the remainder of the roofs with lead. All roofs have stone battlemented parapets. The Church is built of Runcorn flecked stone for external and internal facing and dressings. The porches, aisle passages and space at west end are laid with polished flags; the nave and aisle and chancel-seat blocks and the morning chapel and organ-transept are paved with oak wood blocks, and the chancel pavement and morning chapel inside the altar rails are laid in various coloured marbles in pattern, the steps to the Sanctuary being of red Devon marble. The heating is effected by pipes on the low-pressure system, running in concreted channels under the floors, with grids at intervals, and coils in the aisle window recesses and east and west window sills; there is also a row of pipes all round the clearstory at window-sill level, running through the passage in the walls. Cold air is supplied by outside grids, and, passing over the coils, is injected warmed into the Church. The tower contains a fine peal of ten bells, the weight of the tenor being nearly 30cwt., these have been cast by Messrs. Mears and Stainbank, of London. The cost of the Church has been over £50,000. It will accommodate 1200, but is only seated for 1040. The work has been carried out by the following contractors and firms, Mr. John Hindmarch having acted as clerk of the works: Masonry, Messrs. W. Thornton and Sons, of Liverpool; Carpentry and joinery, &c., J. Hatch and Sons, of Lancaster; Slater, Pickles Bros, of Leeds; Plumber and glazier, Braithwaite and Co., of Leeds; Heating, Mr. B. Harlow, of Stockport; Gas fittings, Messrs. Hardman, Powell, and Co., of Birmingham.

# Perspective in Every-Day Practice.

By WM. N. CUMMING, A.R.I.B.A.

## INTERIORS.

IN my former article on "Exterior Perspective" I endeavoured to treat the subject as simply as possible, and to avoid all unnecessary and intricate rules, my object being to put such instruction in the hands of the student as would enable him to put a simple building in perspective, deeming this to be all that is necessary for a beginner, and appreciating the discouraging nature of the average work on the subject, which to the young student seems to embody such a profound amount of knowledge that he generally gives it up in disgust, preferring to devote his mental energy to some study of a more congenial nature. In the present article I shall endeavour to place interior perspective on the same basis, applying any rules or suggestions that I gave in my first article, so that the student may be able to continue the subject in an unbroken course. First, then, I shall divide the subject into two parts, viz., "Parallel Interior Perspective" and "Interior Perspective with two vanishing points." Parallel perspective is that in which one side or face of the object is parallel to the picture plane, and the other at right angles or perpendicular to it. To illustrate this we will assume that we have a board, sheet of glass, and loop of wire (as explained in Article No. I., Fig. 2), that the object is a square or oblong box, having one side or end removed; place this on the board so that the sheet of glass is between the eye of the spectator and the object, and so that the open side is presented to the spectator, and the bottom or end of the box is parallel to the picture plane as shown on plan (Fig. 1), where A is the object, B the sheet of glass or picture plane, and C the point of sight or station point. If we now draw on the glass, as shown in elevation Fig. 1, first the outer edge of the box (which will be reduced in proportion to its distance from the picture plane), and then the back or bottom of the box, we shall have a representation of the object as shown, the top and bottom lines being parallel. 1, 2, 3, 4 is the open end nearest the spectator, and 5, 6, 7, 8 the bottom of the box. Join 1-2, 2-6, 3-7, and 4-8, and you will have four sloping

lines which will meet in a point exactly opposite the point of sight, and which is called the "centre of vision," this will also be the vanishing point for all lines perpendicular to the picture plane, and practically the only vanishing point required in order to produce a parallel perspective representation of the interior of any object. In this figure the vanishing point or centre of vision is shown in the exact centre of the object, but any position may be chosen to the right or left of this point (as illustrated by Figs. 2, 3, 4), provided that the extreme ray from the outer corner of the object is not at a greater angle than 30deg. to the central visual ray or line of direction. Before proceeding to explain scale, position of picture plane, application of height lines, &c., I should like to point out one or two things that will strike an observer as being defective in such a rule for producing a pictorial view of a room or hall as we see it in reality. In the first place, then, we cannot deal with a room as we can with a box, in respect that we cannot station ourselves outside a room or hall so as to see the interior, but in order to produce a perspective representation of an interior by rule, we are forced to assume that the end wall of the room has been removed, and that we are able to look into the interior of the room as in the case of the box. Were we to place the station point on plan within the room, it would be found that in order to see the entire room the visual rays would assume such a wide angle that a great amount of distortion would take place. It may then be asked how is it that this is not the case in reality? The answer being that whereas by the rule of perspective we are compelled to assume that the centre of vision is a fixed point, in reality, when we view the interior of a room, we allow the eye to move from one point of the room to another in order to see the various details more clearly, and such is the perfect construction of the eye, that it can be adjusted with the greatest rapidity to every new phase of distance or focus, retaining at the same time for an instant the impression of that portion of the room last looked at, so that we can take in a general view of the whole room in an instant of time. It is also interesting to note that if one stands at the end of a room, looking towards the other, and closing one eye, that if a 60° set square be held with the 60° angle towards the open eye, it is impossible to see objects clearly to the extremities of the angle, and that the area of clear vision is within a much smaller angle than that of 60°. I am speaking, of course, of the average sight, there being, I have no doubt, some

cases in which persons are gifted with a wider angle of vision. I mention this to account for certain slight distortions that crop up when applying the rule of perspective to elaborate interiors, and these slight distortions can only be rectified by a knowledge of how things

FIGURE 2.

should actually appear—this will come with practice. I shall now endeavour to place clearly before the student the application of the rules of parallel perspective to a simple building. Fig. 5 is the plan, section, and perspective view of a small room, having a door opening in one side. To put this in parallel perspective proceed as follows: Fix the point of sight or station point at any convenient position so as to get a desirable view of the interior of the room: in this case it is about 14ft. from the front end of the room, this end being assumed to be removed for the reasons before stated, and is indicated by the letters P S on plan. Through this point, draw a line parallel to either side of the room and at right angles to the end, this is the line of direction or central visual ray, and as we are dealing with parallel perspective will always be at right angles to the end of the room. Through P S draw a line at an angle of 30° to either side, as shown, and it will be seen that the picture is well within the angle of 60°. Next fix the position of the picture plane—this to some extent will be regulated by the scale to which it is desired the perspective view should be. In the case in point, I have assumed that the plan and section are drawn to the scale of 8ft. to the inch, and also that our picture is to be to the same scale. The picture plane will then be in position as shown, that is, parallel and coincident with the nearest end to the spectator; but suppose it be desirable to double the scale, it is only necessary to refer to the section where P S is the point of sight, H L the horizon line, and P P the original picture plane. If we now double the distance from P S to the original picture plane, that is, to the point P P 2, this then will be the position of the picture plane on which the scale of the picture will be double, or in other words to the scale of 4ft. to one inch. In order to arrive at any other scale we may desire, if we mark off any definite altitude, say 6ft. from the horizon line (as at X) and (through X) draw a visual ray indefinitely, it is only necessary to take a distance of 6ft. with the compasses from the desired scale, and applying the one leg to the horizon line, to move the dividers outwards from the point of sight till this visual ray coincides with the other point; of course keeping in mind that the points of the compasses must be held absolutely vertical one above the other on the paper. Thus the size of the picture may be increased or diminished as desired, and all heights may be put down to scale, insuring greater accuracy and at the same time saving a great amount of trouble. To proceed then, having fixed the position of the picture plane, the point at which the central visual ray cuts the picture plane will be the vanishing point for the sides of the room, and all objects parallel to these sides, draw visual rays through

FIGURE 1.

\* This article appeared in the last volume.—Ed.

the various points on the plan as shown, cutting the picture plane, and, having fixed your horizon line as in exterior perspective, erect perpendiculars as shown on the figure, having fixed the picture plane in the figure so that our picture is to the scale of 4ft. to 1in. If we now draw a cross section of the room to the same scale, and the horizon line at, say, 5ft. from the ground line or floor of the room, it is only necessary to draw lines from the section to the vanishing point cutting the perpendiculars erected from the picture plane, and we get the perspective of the room. It is unnecessary to go into detail, as with the student's previous knowledge he will be able to follow the figure without difficulty. It follows, then, from this, that whatever position the picture plane is in, it is only necessary to draw a section of the room to the same scale as the position of the picture plane is fixed for, in order to get the heights for the various parts of the room. It must be kept in mind

FIGURE 3.

that parallel perspective only applies to the room itself and its several Architectural features, and not to objects within the room which have not their sides parallel to the sides or ends of the room. To illustrate this, I have assumed in Fig. 6 that a box is placed on the floor of the room, and it will at once be seen that this object must be treated separately, as in exterior perspective, having its own vanishing points entirely distinct from the vanishing points of the room itself. Let A B C D be the room as before, P S the point of sight, P P the picture plane, and E the box placed on the floor. We will require two vanishing points for the box. Proceed in the same manner as in exterior perspective—that is, through P S draw lines parallel to the sides of the box, cutting the picture plane in the points V P 1—V P 2, and we have the two vanishing points for these two sides. Produce the line of one side of the box till it cuts the picture plane and you have the height line for this side; then proceed in the same manner as explained in Article No. 1, and you will have the box in perspective as shown. The student should now have gained sufficient knowledge of the subject to enable him to proceed with more elaborate subjects, and before proceeding to explain double-vanish interior, I purpose giving an example of the application of parallel perspective to an interior of a small hall, applying as many methods and suggestions as I have already given as will be necessary for the production of a parallel perspective of the subject. Fig. 7 shows a plan and section of a small hall originally drawn to the scale of 8ft. to 1in. Fig. 8 is a perspective view of the same hall to the scale of 4ft. to 1in. The point of sight, picture plane, line of direction, horizon line, and vanishing rays having been drawn according to the method which I have given above, and with which the student will now be familiar, it only remains for me to point out the method of working out the perspective view to the enlarged scale. This may be arrived at in either of the following ways, viz., setting up a distance of

10ft. on the original picture plane as at T (see section) and through T, drawing an indefinite visual ray from the point of sight and then taking a distance of 10ft. from the enlarged scale with the dividers and placing the one leg of the dividers on the horizon line to move them outwards from the point of sight till the other leg coincides with the visual ray drawn through the point Z (as at P Q), as explained above for Fig. 5, or, as in this case the scale is exactly double, to double the distance from the point of sight to F, which will give you the point G. This, then, will be the position of the picture plane for the scale of four feet to one inch. Now, working to the enlarged scale, first erect a perpendicular coincident with the line of direction, and on this line fix the centre of vision as at C V, and mark off a distance of five feet down from this point, as at H; through the point C V draw the horizon line H L, and through H draw the ground line. The width of the room is twenty feet, and the line of direction is six feet from the left side, and fourteen feet from the right; mark off these distances on the horizon line, and so on continue to draw the section to the enlarged scale, including the section of the arches on the right side and the door on the left. This being accomplished will give you all the heights necessary for the picture, and vanishing these down so as to cut the perpendiculars erected from the picture plane, will give you the perspective representation of the sides of the hall. It will be noted that the arches on the right are put in the perspective by the rule given in Article I, Fig. 12, otherwise the figure will explain itself if the student has carefully followed out my instructions. It only remains, then, for me to explain one or two points about the dome. Produce the lines of the square enclosing the base of the dome on the plan to the left, cutting the left side of the hall in the points D D, and draw visual rays through these points to the picture plane; erect perpendiculars, cutting the line of the ceiling of the hall in the perspective view, and from the extremities of the base of the dome on the enlarged section draw lines vanishing to the centre of vision through the points E E. Where the perpendiculars cut the ceiling line

FIGURE 4.

draw parallel lines cutting these two in the points K K; this is the square enclosing the base of the dome in perspective. Draw the diagonals and centres as shown, and vanish the points where the circle of the dome cuts these diagonals, and you have the eight points of the circle. The inner circle on plan is a section of the dome at a higher level, and being put in perspective in a similar manner, serves to further illustrate how the dome may be completed in perspective. If the student will work out examples for himself from the information I have placed in his hands, altering the position of the point of sight, enlarging the scale, &c., he will have no difficulty in becoming proficient in parallel perspective. In Part II. of this article I shall illustrate the application of double vanish perspective to interiors.

(To be continued.)

The opposition to the Bill for destroying two of the Birmingham Churches grows apace, and there is yet hope that it may be defeated.

FIGURE 5.

FIGURE 6.

# ECCLESIASTICAL ARCHITECTURE.

BY FRANK CAWS.

WHEN Julius Caesar landed on our shores, Stonehenge, the oldest example of Ecclesiastical Architecture which these islands can boast, was probably in use as a Druid temple. We know next to nothing of the Druids, as to whom or whence they were; and it remains a moot point still whether on their stone altars, such as that at Stonehenge, human victims were or were not offered. The Romans held England for 400 years (off and on), but I am not aware of a single Ecclesiastical ruin in the country which can be traced to Roman origin, though I think tradition ascribes to the ancient church of St. Albans a Roman foundation. The Danes seem to have found no time nor inclination to establish churches in the land; and, indeed, sea-robbers are not of a class who, as a rule, are zealous church builders. But under the Saxons the kingdom grew more settled, and with the first beginnings of Art and Literature we find Architecture taking root in our beloved land. Jacob, a lonely wanderer in the desert—a houseless outcast—reared up stones to God when as yet he had no home of his own. We cannot say the Saxons built churches before they built huts. But of their huts no remnant remains, while not a few Saxon churches, or parts of churches, still witness to the self-denying zeal of our forefathers. The modern Englishman, after visiting Westminster Abbey and St. Paul's, if conducted to the remains of Saxon churches, might feel his lip curling with ignorant contempt for their smallness and meanness. Ignorant I say, because, however small and mean those early efforts of our island race, they are precious as husks, if nothing more, of the germ of our noble and marvellous Cathedral Architecture. There is one essential and very remarkably characteristic difference between the Architecture which took root in these remote islands—remote from the ancient centres of the world's culture—and slowly developed and grew into astonishing vastness and magnificence, and the

much more ancient Architecture of Egypt, Greece, and Rome.

JOHN RUSKIN HAS ABLY POINTED OUT

that while the great Oriental races, and the Romans also, constructed their temples of huge blocks which could not be reared and placed in position without the aid of powerful mechanical appliances, the glorious piles of Cathedral and Church Architecture in the British Isles and Northern France and Germany were built of small stones which could be man-handled. The power of man to adapt himself to his circumstances is singularly marked in this great distinction between Classic and Gothic Architecture. The Saxon churches, which remain to us in a more or less mutilated condition, are like disjointed echoes of the prattle of an infant destined to become a giant. The Saxons employed arches of very small spans, and short, dumpy columns of most undignified proportions. But instead of despising this "day of small things" we will trace the growth of the Cathedral Architecture of the Middle Ages from this uncouth root. The influence of Norman Architecture was already making itself felt in England before William the Conqueror came. It would be a mistake to suppose that all the Norman buildings erected during the reigns of William I., William II., and Stephen—buildings distinguishable by their Norman Architectural character—were the handiwork of only masons imported from the Continent. We are ready at times to boast of the wonderful achievements of Queen Victoria's long and happy reign; and doubtless, in regard to works of civil engineering, they have been unexampled in the world's history. But this is

NOT TRUE OF MODERN WORKS

of Architecture. For nothing that has been done during the nineteenth century in the way of Architecture in the United Kingdom can compare for one moment, either as to

FIGURE 7.

quality or quantity, with the works of Norman Architecture begun, continued, and completed in the 88 years from the Conqueror to the death of Stephen. Churches innumerable, nearly all the castles now existing in this country, and several noble cathedrals! The record is astonishing. The activity of the builders in those days is the more remarkable when we recall the fact that the land was full of petty wars, and society like a repressed fire, ready to break forth into rebellion at any moment against the ruling powers. Take, for example, the County of Durham. The people of Durham treated an envoy of the Conqueror's very much as the people of Cabul treated the British envoy Cavagnari. They murdered him and massacred his escort, so that it is doubtful who lived to tell the tale to the mighty William, who was fighting at the time in Normandy. The rage of the Conqueror on hearing of this knew no bounds. He at once sent an army into Durham County, which harried and massacred the entire population from York to Newcastle, desolating the land and laying it waste. Though the County of Durham is now one of the most densely populated in England, the track of that conquering army is still a comparative waste, and will so remain probably for centuries. Is it not astonishing that, after such universal massacre, the Norman dynasty should witness the building of that most sublime of all our minsters, Durham Cathedral? Where did the men come from who built it? Where did the stones come from? Doubtless the men as well as the stones came mostly from the county, and were to the manner born. They were the remnants of the massacred people. Probably the number actually slain were largely exceeded by the numbers forced to fly from their desolated homesteads and seek refuge, like the poor Armenians to-day, wherever it could be temporarily found. These a few years later would be only too glad to earn a pittance at cathedral building, when they could no longer subsist on their ruined farms. Be this as it may, the startling fact remains that Durham Cathedral—or at least the main body of it, which constituted the first instalment of its huge mass—was erected in the

#### INCREDIBLY SHORT SPACE OF SIX YEARS!

We talk of our forefathers as slow old coaches, and reckon ourselves as mightily sharp in comparison. But our modern St. Paul's took fully five times six years to build, and when completed could not for one moment compare for majesty and sublimity with Durham Minster. The Normans continued the use of the semi-circular arch which the Saxons had commenced, both Normans and Saxons having copied it from those Romanesque buildings (the Architectural *small fry* of Europe) which succeeded the downfall of the Greek and Roman Pagan classic Architectural styles. But the Normans ornamented their arches much more elaborately than ever the Saxons had done, introducing the zigzag or *chevaux de frise* in richly fantastic fashion, as well as the billet-mould and other characteristic ornaments. They also interlaced their arches in decorating what would have otherwise been plain wall spaces, and this intersection of semi-circle with semicircle necessarily introduced, as if by accidental suggestion, the *pointed* arch. But this is only one of the many ways of accounting for the origin of the pointed arch.

Our little systems have their day;  
They have their day and cease to be.

And so the most favoured fashion in

#### ARCHITECTURE

gets supplanted continually by something still more "up to date." The interlaced arching of the Norman period was certainly very beautiful and interesting in all its many varieties of treatment in detail, and one cannot wonder that for a long while it was the rage. But at length people grew weary of it; and then came the pointed-arch period—i.e., the period of the pointed arch *pure and simple*, not intermixed with a procession of overlapping semicircular arches, but quite apart by itself in its own unadorned beauty of severity. It is easy to see that this *earliest* phase of the period of Gothic

Art (known as the Early-English period) is styled the "*Lancet* period," because the narrow, tall, pointed windows are shaped like lancets. The pointed arch when thus first employed in a distinct and separate form had its point very blunt, as the builders felt dubious at first about the stability and propriety of this new shape. But, as time went on, the confidence of the builders increased, and the pointed arches were made sharper and sharper till the end of the "*Decorated*" period arrived. At no period of Ecclesiastical Architecture in this country was the Gothic style so beautifully pure and so severely graceful as in the *Lancet* period, which we may call the *earliest* Early-English period. The Norman Architecture, from which this *Lancet* style emerged, had a sort of barbaric magnificence and splendour, of which the perhaps most notable of the numerous examples are to be found in the cathedrals of Peterborough and Durham. At first, after abandoning the previously constant use of the semicircular arch, the Architects used the pointed arch more and more, and the semi-arch less and less frequently; and very soon the semicircular arch was almost wholly abandoned, and the pointed arch held sway everywhere. But for some considerable time after the semi-arch was discarded the zigzag ornaments and Norman mouldings were employed to decorate pointed arches. Eventually the Architects developed instead a new kind of moulding and various new kinds of decoration (including the dog-tooth), and said good-bye to the zigzag and billet-mould for ever. The period during which the zigzag continued in use as a decoration of the pointed arch is called the *Transitional* period. At St. Cuthbert's Church, Darlington, there is some very

#### LOVELY TRANSITIONAL WORK

of this character. Whitby Abbey may be cited as an example of pure "*Lancet*" of the earliest type, and Tynemouth Priory as an example of "*Lancet*" of a slightly more advanced type. The pure innocence, so to speak, of this earliest Early English was destined soon to lose the bloom of its youth, and as the Architectural age advanced the pointed arch style of building underwent remarkable and very interesting development. Up to this time the windows had, both in the Saxon and Norman times, been placed singly, at more or less regular intervals of space apart, and this continued to be so throughout the early *Lancet* period. But then a new tendency began to develop—a tendency which was destined to revolutionise Architecture in England—viz., the disposition to group windows in twos and threes. This new tendency was less a freak of fancy than an outcome of necessity, and the necessity arose from a new invention or discovery in the great *Art of Roofing*—an art then quite in its infancy. Some genius of a carpenter had been struck with the idea that *every* pair of roof-rafters need not be *trussed*—i.e., tied and braced together to prevent thrust—for if *one* extra-strong and well-trussed pair of rafters (called *principals*) were placed at regular intervals, with strong beams (called "*purlins*") fixed upon their backs longitudinally so as to afford resting-places for the intermediate or "*common rafters*," roofs could be constructed of wider span and with less extravagant use of timber.

#### THIS NEW KIND OF ROOF CONSTRUCTION

had the effect of causing the roof pressures upon the walls to occur at regular intervals of, say 10ft. to 12ft., instead of, as heretofore, equally along the walls everywhere. So the builders found a wall of equal thickness, or nearly equal thickness, at all points of its length was in some places too weak, and in other places too strong, for that new kind of roofing. And they showed their skill and judgment by varying the thickness of the wall to suit the variation of its roof pressures at different parts. Thus where the principal rafters rested the walls were buttressed out and greatly thickened, while at the same time the intermediate walling between buttress and buttress was built much thinner than in the older examples, so that the amount of stone used in a buttressed wall was no greater than in the older style of wall which was thicker and un-

buttressed. In this way it came about that the outer walls became buttressed and "*embayed*" at regular intervals; and in consequence it soon grew to be necessary to group the windows in twos and threes in the thin plain spaces between the buttresses, instead of placing them singly at *equal* spaces apart as in the earliest examples. Having once begun to group their windows, the Early-English Architects rapidly developed this tendency by drawing the openings, as time went on, into closer and closer contiguity, until the wall-space left between openings seemed at length too slender to sustain the solid wall above the window. To correct the weak appearance of these slender pillars, the Architects adopted the plan of throwing one comprising arch above several narrow lancets. This arch had the effect of relieving the narrow mullions of undue load. But the Architects were quick to perceive that the bare space between the relieving arch and the window-tops looked bald and hungry for decoration of some kind. This feeling led to the invention of *window tracery*. At first, plain holes were made through the space (called the "*tympanum*"), and, these failing to satisfy the eyes of those Old English artists, soon tracery began its ever-changeable and always interesting career of developments. To attempt to follow ever so sketchily this development of window tracery, from the birth of it in the day of the Plantagenets to its death in the day of Henry Tudor, would be idle, in the limits of this paper. I must therefore abandon the idea, with which I started, of sketching the bare outline of the development of Ecclesiastical Architecture from the time of the Saxons, through the Norman, Early English, Decorated, and Perpendicular periods of Mediævalism, and through the subsequent stages of Tudor, Elizabethan, Queen Anne, and Georgian Architecture, down to our own day. The subject is a very interesting one, and seems of late years to be attracting more and more of what may be called popular attention, though necessarily those who pursue it must be people with minds of more than average taste and culture. Of the various lecturers who are giving courses on this subject, Dr. Crange, of Cambridge University, author of "*The Churches of Shropshire*," is in my judgment the most worthy of attention. His lectures are such as cannot fail to charm even audiences who have no previous knowledge of the subject, especially when illustrated, as they generally are, by photographic views of many Architectural marvels of beauty and glory, thrown by the limelight on the magic-lantern screen.

PREPARATIONS have been commenced at the Windsor Station of the Great Western Railway for the erection of the "*Queen's Room*" of the new terminus, which is to be finished before June, in readiness for the use of Her Majesty when proceeding to and returning from London during the Jubilee commemoration.

THE Goldsmiths' Company, one of the richest of the twelve great City Livery Companies, has announced its intention of setting aside £20,000, for the purpose of founding a charity for the relief of needy employés in the gold and silver trade in the Metropolis, which large class of workers cannot at present receive any benefit from the funds under the control of the Company.

A SUB-COMMITTEE of the Glasgow Corporation has recommended that the proposal to straighten the Clyde from Rutherglen Bridge to St. Andrew's Bridge should not be entertained at present. The objections are:—The great expense and risk, the recent filling-up of the Flishers' Haugh, and the difficulty in coming to arrangements with riparian proprietors.

A MONUMENT of Bath stone, with a large cross on the top, has been placed over Bishop Thorold's grave in the Water Close of Winchester Cathedral, just beneath the south window of the Lady Chapel. On one side are a mitre and the diocesan arms beside those of the Thorold family, and on the other side is a pastoral staff. The other memorial to Bishop Thorold at Winchester is to be a large stained-glass window in the Cathedral.

## PRINCIPLES OF THE LAW OF RATING AS AFFECTING ENGINEERING WORKS.

### LIVERPOOL ENGINEERING SOCIETY.

A MEETING of this Society was held at Liverpool on the 17th ult., the President, Mr. S. B. Cottrell, in the chair. A paper was read by Mr. Ernest W. Pierce, Assistant Town Clerk, Liverpool, entitled, "Principles of the Law of Rating as Affecting Engineering Works." After referring to the importance and the general want of precise knowledge on the part of the ratepaying public on questions of rating, Mr. Pierce said that the difficulties of the subject were not lessened by the manner in which it is expounded by rating experts and others who make it a special study, and who, speaking from an advanced knowledge of the subject, render that which was before perplexing more incomprehensible; and it was with a view to provoking a discussion, and thereby removing some of the doubt, that he was induced to address them on the subject. The statute, passed in the 43rd year of reign of Queen Elizabeth, which originated the present system of assessment for the relief of the poor, proceeded on the principle that every inhabitant of a parish should contribute to the relief of the poor according to his ability, personal and real property all being rateable alike. Following this, a system of assessment was established in each parish, but in the absence of defined principles there was a marked absence of uniformity in procedure throughout the country. Notwithstanding the statute declared both real and personal property liable to assessment, in practice it was only in a few parishes that personal property was assessed. The establishment of railways and other important undertakings, extending through parishes, rendered it imperative that an

### UNIFORM METHOD OF ASSESSING PROPERTY

should be established—this was done by an Act passed in 1836. This statute defined the method of assessing property at the present day. It did not define the "net annual value" as the rent at which the property is actually let, but "as the rent at which it might reasonably be expected to let"; and it frequently happened that the actual money paid to the landlord did not represent the real letting value of the property. There were many ways by which an owner could receive value for his property other than the payment of rent in coin; and on the other hand the rent paid might be in excess of the actual letting value, and include considerations which are not rateable. The adoption of the hypothetical principle contained in the section established a common standard of value, and afforded a fair and just method of estimating values capable of universal adoption. The various considerations which go to determine "value" were numerous and complex, but were based upon the economical principles upon which exchangeable value is founded. In all cases value should be assessed with due regard to the competition of the imaginary or hypothetical tenant, whose sole object in life was the acquisition of profit or value. The method of estimating the value of undertakings, such as railways, waterworks, and other concerns of a commercial or quasi-commercial character, was by examining the results of their working and taking the gross revenue derived from them as the basis, due regard being paid to other circumstances of the case. The first important provision to bear in mind in respect to the rating of engineering works was sect. 133 of the Lands' Clauses Act, 1847, which required the promoters of any undertaking taking lands charged with land-tax or poor-rate to make good the deficiencies in these from time to time until the works are completed and assessed to the land-tax and poor-rate. In addition it appeared that if a contractor erects large workshops and workmen's cottages in connection with the construction of the works, he was liable to be rated for those properties. In the assessment of railway works it was, in the first place, necessary to arrive at the assessment of the whole undertaking, the gross earnings thereof being calculated on an average of

three years' receipts and expenditure minus the cost of the labour, skill, risk and capital employed in connection with the occupation of the concern. Having arrived at the gross rateable value the statutable deductions were made, also the usual tenant's rates and taxes and the tithe-rent charged, if any, with the annual cost of the repairs, insurance, and other expenses necessary to maintain the works in a state to command rent. The net rateable value of the line, exclusive of such properties as stations, which are rated separately, having been arrived at, it next became necessary to apportion it amongst the several parishes in which the works were constructed. To do this, the expenses incurred in earning the gross receipts in each parish were ascertained, the same process being gone through for each as if the whole line were in one parish. In the case of

### A COMMERCIAL UNDERTAKING

on business for a profit, this method of assessment was probably as equitable as could be devised; but in such cases as a waterworks belonging to a municipal body, prohibited by statute from making a profit, it was doubtful whether it was the correct one to apply. With a body so constituted the gross earnings were the equivalent of the gross expenses; and it yet remained to be authoritatively decided how the rateable value of waterworks, constructed and occupied by a municipal corporation, prohibited from making a profit should be arrived at. In electric-lighting works the same principle of assessing works by reference to their gross earnings was to be found. In the practical application of those principles much difficulty and labour was involved, and much scope left for the exercise of ingenuity on the part of rating experts and of the managers and engineers of such works—especially in that branch which dealt with deductions. Deductions were of two classes—tenants and statutable; and the effect of deducting from the gross earnings, the former was to arrive at the gross rateable value, which, again, minus the statutable deductions, gave the net value. The usual tenants' deductions were enumerated and considered under the heads of working expenses, rates and taxes, law costs, royalties on patents, &c., goodwill, auxiliary ventures, renewals and repairs of tenant's stock, insurance, indirectly productive property, depreciation in stock, and capital. The statutable deductions included tenants' rates and taxes and the tithe rent charge, if any, and the probable cost of repairs, insurance, and other expenses necessary to maintain the hereditaments in a state to command the rent. In the Metropolis a scale of deductions for different classes of property was provided by the Valuation (Metropolis) Act, 1869, but in the country at large it was more indefinite, though the assessment committees of certain Unions had laid down rules similar to those in the Metropolis. Two other modes of arriving at rateable value were by calculations based (1) on the rent actually paid, and (2) on the contractor's theory of rent. The latter was founded on the assumption that because a person has spent a certain sum upon the creation of the property he would have been equally willing to have paid a reasonable percentage on the outlay, plus the average annual cost of repairs, insurance, and depreciation as rent to a contractor willing to erect the property and let it to him. Though applicable in many cases, this principle must be followed with much caution, as

### THE STRUCTURAL COST

was occasionally out of all proportion to the letting value, as, for instance, in the case of country mansions. After dealing with the rating of machinery and plant, Mr. Pierce went on to the subject of the rating of advertisements, which he considered of much practical interest, as it was not an uncommon practice for contractors to earn an honest penny by letting spaces on the hoardings erected around works in course of construction for advertising purposes, and contractors should accordingly be made aware of the provisions of the Advertising Stations (Rating) Act, 1889. It enacts that

ments, but not otherwise occupied, the person who shall permit the same to be used, or (if he cannot be ascertained) the owner thereof, shall be deemed to be in beneficial occupation of such land, and shall be rateable in respect thereof according to the value of such use as aforesaid, and where land occupied for other purposes is used for the exhibition of advertisements, the gross and rateable value of such land or hereditament shall be so estimated as to include the increased value from such use as aforesaid. It therefore behoved contractors to keep a sharp look-out upon their hoardings, as they would be liable to be rated should advertisement bills be posted thereon. After referring to some standard works on rating, Mr. Pierce said he was convinced that a competent knowledge of this branch of law was essential to the educational equipment not only of engineers, but of the public generally, as with the increasing burdens in the nature of taxation which civilization seemed to bring in its train, a knowledge of the system under which those burdens are apportioned amongst the tax-paying public must necessarily tend to a fair and impartial administration, whereby no man would escape his just and careful contribution, and at the same time no man be charged with a greater proportion of the public burden than by the law of the land he is liable to bear. A discussion followed, and a vote of thanks was accorded Mr. Pierce for his paper, to which he replied.

### LONDON'S DEFENCES.

THERE seems to be a widespread misconception as to the nature and extent of works proposed for strengthening the defence of London. Already the assumption that a chain of permanent and costly forts, forming a girdle round the capital, is contemplated, has occasioned a great outcry from those who think that land fortifications are unnecessary so long as we have a sufficiently strong navy. Ten years ago, Sir Edward Hamley explained in a few memorable words what were the needs of the capital for effectual defence. He proposed that we should "mark out round London lines of defence to meet all possible lines of attack upon it, not to be constructed except on the imminence of war, but to be thoroughly planned, and the means of erecting and occupying them kept always ready." Sir E. Hamley's scheme, with slight modifications, was accepted by all the ablest military authorities of that time. It took practical shape after a preliminary survey of the most suitable defensive positions by the purchase of thirteen sites as centres of defence at a cost of £30,000 ten years ago. Since then, under successive administrations an additional sum of £38,000 has been expended on the necessary works for making some of these centres suitable in case of invasion. Nothing like a fortification has been constructed, but simply defensible storehouses, in which trenching tools, camp equipments, and possibly munitions of war may be kept ready for issue in time of emergency to the Volunteers and Militia, on whom the task of defending those positions would mainly fall. Ultimately the positions would have to be strengthened by earthworks, but these need only be thrown up when and where the danger of attack seemed imminent. The essential thing is that each brigade shall know exactly where it would have to assemble if the emergency ever arose, and that it may be sure of finding there the stores and material necessary for placing the position in a state of defence. It is in furtherance of this scheme that the Government now ask for a vote of £96,000 in order that the thirteen central magazines, for which land has already been bought, may be completed. In addition to the mere buildings, it will be necessary to make proper approaches, and form military roads by which to connect the various centres as links in a continuous chain. Of the three centres already completed, two are on the south side of London, and one on the north. The vote now asked for is to complete ten other storehouses as points of concentration for different brigades, all on the south, between Erith and Tooting.

## THE WALLACE ART COLLECTION.

NO greater stroke of testamentary good-fortune has fallen to the nation than the bequest of the late Lady Wallace, of the collection of pictures and other objects of Art formed by the late Marquis of Hertford, inherited and considerably increased by the late Sir Richard Wallace, and now at Hertford House, Manchester-square. The collection is one of the largest and richest ever formed by private persons, and its value at current prices is estimated at several millions sterling. It will probably necessitate an enlargement both of the National Gallery and of the South Kensington Museum. It consists of paintings, sculpture, furniture, and "objects of Art," though perhaps not all of those may be included in this splendid benefaction. The Marquis of Hertford and Sir Richard Wallace were both great collectors, and both had access to the great treasures of Art on the Continent, and command of the best technical counsel when it was needed to supplement any occasional defects of their own all but perfect taste and knowledge. Hertford House is really a

## VAST MUSEUM OF ALL THE ARTS,

rich not only in pictures, but in gold and silver workmanship, Renaissance and rococo furniture, majolica, porcelain and bronzes. The furniture is the spoil of old Versailles and of the other Royal chateaux of France, as their contents were dispersed under the hammer in the course of successive revolutions. The boudoir of the late Lady Wallace is entirely hung with examples of Greuze, and some of its furniture came from the Petit Trianon where Marie Antoinette alternated the part of shepherdess and milkmaid with the part of Queen. Another room is devoted to Gainsborough and Reynolds. A great fresco by Luini is the principal decoration of a third. Rembrandt, Van Dyck, Velasquez, Murillo, Guido Reni, Canaletto, and other great masters of the past occupy one large gallery. The modern school occupies another, and this is said to surpass the Luxembourg in the importance of its French work of our time—a department in which our own National Gallery is at present deplorably weak. It includes twenty-five masterpieces by Meissonier, thirteen by Delaroche, over thirty by Decamps, and four or five by Ary Scheffer. The specimens of

## THE ENGLISH SCHOOL

will make a welcome addition to our stock of Boningtons, that fine English painter whose work did so much to create modern landscape in France, and who has hitherto been far more known and honoured in the land of his adoption than in the land of his birth. Add to all this that the collection of ancient armour is unrivalled in England, and that it includes a suit of the Duke of Alva, and the helmet of a Doge, and we have good reason to congratulate ourselves on the prospect of what is in store for us. The pictures were sometimes shown to visitors at Hertford House; they were frequently shown in select examples at the exhibitions of Old Masters, and a large contingent of them formed one of the principal features of the Art Treasures Exhibition at Manchester. The nucleus of the collection was originally formed at a house in Berkeley Square. The present house in Manchester Square was rebuilt by Sir Richard Wallace, to whom it was bequeathed more as a museum than as a residence. Old Manchester House, as it was first called, was built by the Duke of Manchester in 1776. The second Marquis of Hertford, into whose possession it afterwards passed, was one of the friends of the Prince Regent. The third Marquis was an indefatigable collector, and rather than stand idle, he, at one time, bought the automaton clock from old St. Dunstan's Church, and had it set up, giants and all, at his villa in the Regent's Park. The fourth Marquis left nearly everything to Sir Richard Wallace, who, in his turn, made Lady Wallace his universal legatee. Her death took place the other day; and the reading of her will confirms the early announcements.

## NORTH-WESTERN SANITARY INSPECTORS' ASSOCIATION.

A MEETING of the North-Western Sanitary Inspectors' Association was held at the Royal Institution, Colquitt Street, Liverpool, on the 13th ult., the President, Dr. Francis Vacher, presiding. The following towns among others were represented: Liverpool, Manchester, Wigan, Preston, Birkenhead, Ince, Wallasey, Waterloo, Norden, Priscot, and Whiston. The minutes and correspondence having been disposed of, the names, &c., of thirty-seven new candidates for membership were considered and approved. Draft rules for the newly-formed Association library of works on sanitary and allied subjects were compiled and referred to the next general meeting for adoption. The Council had also referred to this meeting a resolution to change the title of the Association to "The North-Western and Midland Sanitary Inspectors' Association" owing to recent large extensions in the area represented. The question of uniformity in the statistical portion of Inspectors' annual and other reports to the county authorities was also discussed, the meeting affirming the need of such uniformity, and a sub-committee was appointed to inquire into and report on the matter. After some other items of general business had been dealt with, a lecture was given by Dr. Wm. Berry, Officer of Health for Wigan, entitled

## "THE ISOLATION OF INFECTIOUS DISEASES."

Dr. Berry said that, as a small contribution to the knowledge of this important subject, but mainly with the object of evoking a discussion thereon, he was desirous of relating some efforts which had been made in Wigan to cope with infectious disease. When he was appointed to his present position, he found there was an all-round list of infectious cases to be dealt with, viz., smallpox, typhus, enteric, and scarlet fever. The two first-named being the most dangerous, and being of opinion that they were communicable by aerial connection, he decided to use their isolation hospital solely for these diseases, and to try home isolation for scarlet fever and the rest. The responsibility was serious enough; but his Committee helped by giving him a free hand, and his colleagues in the sanitary department were energetic and enthusiastic. From a twenty years' experience in private practice, he knew what was possible in home nursing, and he had found that it was only when instructions were given with a lukewarmness that people do not attempt to carry them out. It was only within the last twenty-five years that hospitals had been erected for preventing the spread of disease; formerly, the fever hospital in large towns was for the purpose of treating infectious patients, not for the prevention of further cases. It was in connection with smallpox, about 1868, that isolation was first advocated in a pamphlet on the subject by Sir James Thompson; now we had come to look upon isolation as a benefit to others rather than to the sufferer. But it was generally agreed that, for all communicable diseases,

## ISOLATION IS AN IMPORTANT PROVISION

in preventing their spread; and he thought it necessary for all towns and districts to have ready hospitals for isolating such a disease as smallpox, and not to introduce them only under the panic of an epidemic. With regard to such diseases as scarlet fever, they were treated differently by different authorities. He would for his purpose divide the current ideas as to isolation into three parts: Complete, efficient, and sufficient isolation. To carry out complete isolation would require a hospital on the top of a mountain, well provisioned for a time, and inaccessible except for the admission of the patients, who would need to be deposited in a lodge for the purpose, and removed by the attendants in the hospital. The nurses and doctor would require to be put in quarantine before commingling with the outside world. Efficient isolation was what is aimed at now, and answered very well. Irksome restrictions were not practised on the patients' friends, and the nurses and doctor were unimpeded in their

coming and going, the same as in an ordinary hospital. But what he termed *sufficient* isolation was the plan adopted in Wigan, with such diseases as scarlet fever. Their pavilions were set aside for smallpox and typhus, and other diseases left to home isolation. On receipt of a notification, the Inspector visited the house, and gave the necessary instructions as to isolation. Revisits were made each second or third day until disquamation had ceased, and then the usual fumigating and cleansing of the house, and stoving of the bedding and clothing followed. During twelve months they had 151 notifications of scarlet fever, and removed to the Sanatorium 43, leaving 108 to be treated at home. In sixteen houses there occurred more than one case, but in one half of these two children sickened about the same time or the day after, so that if the first case had been promptly removed on notification, there would have remained the second one to deal with. He would not deny, however, that isolation in a hospital for the purpose is an important sanitary arrangement for preventing the spread of infectious disease, but, at the same time, it was a costly method for the ratepayers, and it must be remembered, also, that parents and guardians had a duty to perform towards those in their charge, notwithstanding the tendency to relieve them of these burdens. There were always a sufficient number of patients who could not afford "proper lodging and accommodation" for isolation purposes, and these must be removed; but, with regard to those householders who could ensure a sufficient measure of isolation, the Sanitary Authority had no right to make them its debtor by forcing the patient into hospital. That in such circumstances the patient, unless a pauper, became a debtor to the authority was evident from section 132 of the 1875 Public Health Act. After quoting Dr. Wynter Blyth in support of his contention, and referring to the erection of hospitals by joint authorities, Dr. Berry concluded by inviting criticism of his views. A long discussion followed.

THE new set of bells for St. Peter's Church, Titchfield, which have cost £300, have been formally dedicated by the Bishop of Guildford. They are six in number, four of them being old ones recast.

At the Mart, Tokenhouse Yard, Messrs. Debenham, Tewson, Farmer, and Bridgewater recently offered the Princess's Theatre for sale by auction. The best offer made was £20,500, at which price the property was withdrawn.

A MEETING of the Consultative Council of the Building Trades' Exhibition was recently held at the offices, 43, Essex Street, Strand, W.C., Prof. Banister Fletcher presiding. There were present: Messrs. Lewis Angell, Chas. Barry, G. M. Callender, H. Phillips Fletcher (hon. sec.), A. J. Gale, F. T. W. Goldsmith, P. N. Hasluck, E. J. Kibblewhite, Ellis Marsland, H. Greville Montgomery (manager), W. G. Penty (York), H. Riches, Edwin O. Sachs, John P. Seddon, A. H. Ryan Tenison, E. W. Thornton, W. Seckham Witherington, Gilbert Wood. The minutes of the previous meeting were read and confirmed, and the following report was read as to the prizes promised in connection with the Handicraft Competitions: The Tylers and Bricklayers' Company, the Worshipful Company of Carpenters, The Building News, The Building World, The English Mechanic, H. Greville Montgomery. It was agreed to ask Architects and others for the loan of drawings and models of buildings, and it was decided to hold conferences during the Exhibition in the different sections of the Building Trades. It was suggested that various associations connected with the Trades be invited formally to the Exhibition during the time it is in progress. The designs for the poster on view at the offices, for which a premium of £10 was offered, created lively interest amongst those present, and an informal plebiscite of the best design was taken. It was agreed to hold the next meeting of the Council at the Royal Agricultural Hall just previous to the opening of the Exhibition.

## NEW ARCADE FOR BIRMINGHAM.

MATERIAL progress has been made in relation to the scheme for the erection of a proposed new arcade at Birmingham, connecting Corporation Street with High Street and New Street. Birmingham is peculiarly situated in regard to its shop accommodation, which, in many respects, is inferior to cities of less importance. The centre of the town is cut off on the south side by the largest railway station in the world; on the east side by the steepness of the ground and the fact that there is no leading thoroughfare into New Street from that quarter of the city; on the west and north-west are situated the professional quarters and St. Philip's Churchyard, which completely sever that part from the rest: while on the north the manufactories hem in the retail shop quarters beyond the Law Courts. Consequently there is no prospect for any great addition to be made to shops within the central area. The land is too valuable, and there is not depth enough between the existing streets to cut fresh ones. Under these circumstances it has occurred to a syndicate that the only way out of the difficulty is to make an additional arcade or covered street between the busy thoroughfares of Corporation Street, High Street, and New Street. The leases of a large area of land in New Street, High Street, and Union Street and Union Passage are falling in, or have already fallen in; and the old property is worn out, and will have to be

## REPLACED BY MODERN BUILDINGS.

It is proposed to make an arcade the same width as the Great Western, starting at the corner of Corporation Street, at the junction of Union Street, Martineau Street, and Cherry Street, and running in an oblique direction across Union Passage, and from thence into High Street, where Britten's shop now stands, with an arm into New Street, coming out opposite the Grammar School. This latter part of the scheme it is not proposed to commence until 1900, when all the leases have expired. The number of new shops in the Corporation Street and High Street section will be about sixty-two, but there will only be an actual increase of about fifty; while the New Street section will contain twenty-two shops in addition to the frontage shops. It is not proposed to pull down the property at the corner of Corporation Street and Union Street, but to pierce the block of which the Temperance Institute and the Public Benefit Boot Establishment are the principal occupiers. Behind this the site of the Old Library (of which the lease has only sixteen years to run) would be absorbed and a slight corner would be taken from the premises of Messrs. Chamberlain, King, and Jones. Beyond this, and about 260ft. from Corporation Street, it is proposed to construct a central dome, from whence the arcade will divide, as before indicated, one branch leading into High Street and the other into New Street. It is anticipated that the passenger traffic from the Aston side of Birmingham and from the Great Western terminus will to a large extent make use of this new thoroughfare, as it will be the shortest way to the markets, the omnibus terminus in New Street, and to the south-east side of the city.

## THE PRINCIPAL LANDOWNERS

are the Corporation of Birmingham, Earl Howe, and King Edward's School, and negotiations are proceeding with them on a satisfactory basis. A number of leasehold interests will have to be acquired, and if the promoters are met in a fair and reasonable manner there appears to be a probability of the scheme being carried through. It is estimated that the income derived from the shops will add something like £10,000 per annum to the ratable value, and thereby provide means to carry on the much-needed widening in Bull Street, High Street, and Steelhouse Lane. The Louvre, in High Street, is at present being rebuilt, and it is contemplated to make still further additions to this undertaking, with an access to the new arcade, when this establishment will become one of the largest

retail shops in the city. The length of the Corporation Street and High Street section will be about six hundred, and that of the New Street section about two hundred feet, and the design, prepared by Messrs. Newton and Cheate, Architects, is in Moorish style, the walls being entirely faced with ornamental glazed tiles, with a gallery over, and a high glass roof. The substitution of tiled or Doulton-ware facings for paint will do away with the necessity of the large annual outlay for painting, and the building throughout will be lit with the electric light. Each shop will have an average depth of from 20ft. to 30ft., with a basement under and stock-room over, the upper floors in the New Street and High Street ends being laid out for offices, &c. Messrs. Walter Ludlow and Briscoe are surveyors to the promoters of the scheme.

## SHEFFIELD'S NEW TOWN HALL.

THE new Town Hall building which Her Majesty will formally inaugurate stands on a site which up to a few years ago was covered with old and unattractive shops, houses, and workrooms. Beauty of outline and richness of treatment, rather than magnificence of proportion and the dignity of vastness, are the qualities which strike you on first getting a glimpse of the building. Externally the most striking feature is the lofty tower, on the summit of which, 200ft. above ground, stands a bronze figure of Vulcan, 7ft. high. The clock with its four illuminated dials has been supplied by Messrs. Potts and Sons, of Leeds. The style of Architecture adopted in the building is the Renaissance, of a distinctly modern character. In the details of the structure, both external and internal, the Architect, Mr. E. W. Mountford, of Buckingham Street, Strand, has introduced symbolic devices which give a special interest to the building. There are four frontages, facing Pinstone Street, Surrey Street, Norfolk Street, and Cheney Row. The principal entrance, which is in Pinstone Street, is flanked on each side by double columns. In the spandrels of the arch are carved figures representing Electricity and Navigation. On each side of the central gable is a carved frieze, 36ft. in length and 3ft. 6in. deep; one portion represents Labour, and contains figures in bas-relief of ironfounders, saw-grinders, miners, and other artisans; and on the other are figures depicting the Arts—Architecture, Painting, and others more typical of Sheffield, such as Electroplating, Modelling, and Ivory-working. The whole of the sculpture has been executed by Mr. F. W. Pomeroy. The marble and stone work of the interior have a striking effect. The vestibule and the grand staircase, approached from the Pinstone Street entrance, are impressive in their cold marble of varied but harmonising hues. The staircase hall, 40ft. square, is, like the vestibule, paved with marble. The staircase itself is carried on arches supported by marble columns, and the walls are lined with a variety of Devonshire, Derbyshire, and Irish marbles. At the head of the staircase is the grand corridor, 150ft. long and 10ft. wide, having marble-lined walls, marble floor, and vaulted ceiling. This corridor gives access to the reception rooms and the banqueting hall. Each room is complete in itself, but the three are so arranged that on great occasions they can be made into one apartment, 155ft. long and 33ft. wide. The Council Chamber is also an admirably designed apartment, 60ft. by 40ft., and lighted on three of its four sides by large traceried windows. Three commodious committee rooms are likewise provided. The total amount expended has been about £167,000. Of this £49,000 must be reckoned as the value of the land; £100,000 as the cost of the building itself, and £18,000 for fittings and furniture. The contractor is Mr. Edmund Gabbutt, of Liverpool.

It is stated that at a meeting of the North-Eastern Railway directors at York, it was resolved to make improvements at the West Hartlepool docks, which will entail an expenditure of about £14,000.

## A GREAT MUNICIPAL ENTERPRISE.

UNLIKE the majority of the schemes which have been undertaken by the London County Council, the extensive improvements taking place in Shoreditch, though now in a fair way towards completion, have as yet engaged but very slight public attention or criticism. The fact applies no less to municipal than to private undertakings, that they who talk least act most. So that although little or nothing has been known, except locally, of any municipal movement in the East End, for the past five years there has been working out on a large scale a practical scheme for the housing of the working classes. By the end of next year it is hoped the entire undertaking will be complete, and an object lesson will then be available to all those, native or foreign, to whom the difficulties of dealing with insanitary areas may occur. The enterprise, in a word, consists in the substitution of good residential dwellings for pestiferous slums, at a maximum of advantage to those most nearly affected, namely, the prospective occupiers, and at a minimum of burden upon the rates. Until about five years ago there existed behind Shoreditch Church, between High Street, Shoreditch, and Church Street, Bethnal Green, an area of about fifteen acres occupied by rookeries and slums of the very worst character. The houses on the site numbered 730, and were occupied by nearly 6000 persons, mostly of the labouring classes. More than two-fifths of the inhabitants lived in one-room tenements, while a greater proportion held a share in two rooms. The average death-rate for this district, during the three years immediately prior to the clearance, was over 40 per annum per thousand. That of the neighbouring districts was 22·8, and that of the whole of London for the same period 18·2. Under the Housing of the Working Classes Acts, the medical officers of the Shoreditch and Bethnal Green Districts made representation of these facts, and as a result the whole area, officially entitled the "Boundary Street Area," was

## CONDEMNED AND CLEARED.

Thus far the Council was but following up the policy of the Metropolitan Board of Works. But while the latter body invariably sold in public market such sites as were cleared in this way, the County Council was so pressed to find accommodation for the occupants whom it had unhoused, that it was a matter of urgency to at once commence the erection of dwellings on the site. The Architect to the Council produced a scheme dealing with the entire area. This was approved and commenced in detail, and although much still remains to be done, it is estimated that by the end of 1898 the whole area of fifteen acres will be covered. When this is the case there will be accommodation for 4600 persons in all as compared with 5719, the number which under greatly congested conditions the original slums on the site harboured. The general plan that has been adopted includes the formation, approximately in the centre of the site, of a circular open space some 300ft. in diameter, with seven streets radiating to the thoroughfares on the borders of the area. A main road opens out of High Street, Shoreditch, by the side of Shoreditch Church, and runs directly to the central circus. This road is 60ft. in width, while the subsidiary streets are 50ft. wide. The centre of the new circus, named after the present Chairman of the Council, "Arnold Circus," is occupied by a terraced mound, formed of the soil removed in sinking the foundations of the new buildings. The mound has a promenade at half its height, and at the top there is a large space which will be in part occupied by a bandstand. The Parks Committee will undertake the planting of this mound, as well as the provision of trees in all the streets on the site. It is worth noticing that the throwing up of this mound, which will form one of the most picturesque features of the scheme, effected a saving to the ratepayers of some £1250 which must otherwise have been expended in the cartage of the soil elsewhere. The buildings are in various stages of completion, some

being already occupied, while others have but lately been commenced.

#### THE PLANNING

of the various tenements is good—light, air, and convenience apparently being the leading considerations. And in this connection it may be said that no little difficulty was added to the work by the Medical Officer, who required that every tenement should possess through ventilation. This at once precludes the use of the common back-to-back type of tenement. In some cases profit has been made of this difficulty, where the disposition of scullery and offices go to form an effective feature or elevation, without disregard to a single inch of floor area. In fact, both in design and construction, a true economy appears to have been held in constant view. The accommodation consists of suites of rooms of various descriptions, containing from two to five rooms, with offices, etc. There are also a few single-room tenements. The average rent is about 2s. 6d. per room, and the rents may not, by the resolution of the Council, "exceed those ruling in the neighbourhood." Not more than two persons are allowed to a room, and this regulation is rigidly enforced by the Superintendent and his seven subordinates, whose constant duty it is to supervise the cleanliness and orderliness of the whole establishment. Light and airy workshops are also provided on the area, and stand in constant demand. They are let chiefly to those engaged in cabinet-making, the most important craft in this district. A capacious and well-fitted steam laundry, with baths and club rooms, forms part of the buildings, and enables the inhabitants of the dwellings to carry out their washing at a cheap rate, with the minimum of discomfort and labour. Gas is laid on in every room by the Council, the gas being purchased in bulk from the company at a reduced rate, and dispensed by means of penny-in-the-slot meters to the tenants. The buildings are fireproof throughout, and in external appearance have nothing of that grim character of stint which has set its mark on most of the artizan dwellings hitherto. There is no monotony of effect. This is due in part to the variable treatment adopted for the different blocks, and in part to the system of radiating streets. It was originally proposed to deal with the site in chess-board fashion, setting out the roads at right angles, and filling the interspaces with rectangular blocks of buildings. The obvious disadvantage, however, of a rectangular plan is that except from those tenements which occur at the corner of any street the outlook is bounded by the block of buildings immediately opposite. Under the present system the occupants of nearly every tenement enjoy a picturesque prospect: and this at no sacrifice of convenience or economy. It may be well in conclusion to glance at the financial side of the venture.

#### THE TOTAL COST

of the clear site, including the purchase of the land and acquisition of the whole of the old property, amounted to about £250,000. This capital sum must be paid off within the next fifty-two years in accordance with the conditions laid down by the Local Government Board when the loan was made; meanwhile 3 per cent. interest must be paid on the amount. The erection of the new buildings and the formation of streets will, at completion, have cost about £270,000. This represents an investment which, according to the minute and careful calculations of the official valuer, will, after all deductions have been made, produce a nett interest of over 4 per cent. It is estimated that this 4 per cent will pay the 3 per cent referred to as due for fifty-two years on the capital sum expended in the acquisition of the site and old premises, and that, in addition, the 1 per cent odd which remains every year as surplus will, at compound interest, produce at the end of the fifty-two years an amount sufficient to pay off the capital sum without further tax upon the rate-payers. From that time the dwellings will not merely be self-supporting, but will tend to relieve the rates in perpetuity to the extent of 4 per cent upon the £270,000 spent in erecting the buildings. On the occasion of the recent visit of the Architectural Association, by the

courteous invitation of Mr. Blaskill, to the area, Mr. Owen Fleming, of the Housing Branch, Architects' Department, conducted the party over the buildings, and lent material aid to the visitors by his lucid and interesting description of the financial part of the undertaking.

#### PUBLIC WORKS IN IRELAND.

BY order of the House of Commons Class I. of the Civil Service estimates for 1897-8 has been printed and published. It contains the figures of the projected expenditure on new public works and improvements in Ireland for the coming financial year. The total estimate of the Irish Public Works Board for the financial year that is now drawing to a close was £214,172; the estimate for next year is £213,867. The estimate for new works and buildings is £87,966, a decrease of £1993 on the figures for the current year. £2500 is to be the estimated expenditure on the Shannon drainage works, as compared with £3000 for 1896-7. The biggest item under the heading of new works is the £40,000 for grants in aid of new National schools, the sum to which the vote for this purpose is now definitely limited, whatever may be the requirements of the service. Postal and Telegraph Buildings are to be voted the next largest amount; £9500 is asked for the Belfast Parcels Office, out of a total estimate of £12,500, £2000 of which was voted last year; £4000 for the Dublin Postal Stores at Aldborough House, out of a total estimate of £8750, the balance of which will be required later on; £1000 for a new Post Office at Newry, upon which £4000 in all is to be spent; and £950, for alterations in the Dublin G.P.O., which are estimated to cost £1400 when completed. Next in importance is the estimate for new Coastguard and Naval Reserve stations, and improvements in the old, under which heading £9937 is asked, as compared with £8702 last session; £2700 is set down for a new station at Roundstone, £4892 for a station at Burton Port, £2184 for a station at Glenarm, £2520 for one at Portmagee, £2630 for one at Portmuck, £2465 for one at Arthurs-town, £2586 for one at Lawrence Cove, and £3500 for one at Dunnycove. £1500, out of an estimated total of £5600, for improvements at the Viceregal Lodge; £2000, out of an estimated £3100, for improvements at the Central Police Court; £1200, out of £10,500, for the complete rebuilding of the boundary wall at Dundrum Lunatic Asylum; £2690, out of a total estimate of £3140, for improvements in Science and Art Museum, National Library, and Botanic Gardens; £1290 for changes in the Customs House, are the chief additional items of expenditure in Dublin.

A MOVEMENT is on foot to complete the Cowper Congregational Church at East Dereham, by the addition of a tower and spire.

£15,000 is still required to complete the various additions and improvements proposed and partly carried out at the Sussex County Hospital.

A LARGELY-ATTENDED meeting of the parishioners of St. John's, Ipswich, has been held to discuss the proposal for the building of a new Church.

THE new schoolrooms and parochial rooms which have been erected in Church Street, Yeovil, in connection with St. John's Church, were opened a few days ago. The total cost was about £2500.

A BURIAL cist has been discovered at Locharbriggs, a village in the neighbourhood of Dumfries, by some workmen who were stripping the till from a piece of land beside the freestone quarries. The sides were constructed of stone slabs, and a similar slab served for cover. In the cist was a cinerary urn.

ONE curious and inconvenient result of the recent spells of frost and snow in London, is the extraordinarily broken up condition of the asphalt in that part of Holborn under the jurisdiction of the St. Giles' Board of Works. It has been almost entirely destroyed, and is full of holes and depressions.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 3rd, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

THE work undertaken by the London County Council in carrying out the order of Mr. Lane, police magistrate, for the demolition of 7ft. of a new building at the opening of Prince George Road from Stoke Newington Road was practically completed last week. The building had been erected 7ft. beyond the building line, as defined by the superintending Architect of the London County Council, and after the foundations had been put in, the Council summoned the builder to the North London Police Court, but the magistrate upheld the builder. Notice of appeal was given, and the case was ultimately decided in favour of the Council. In the meantime, however, the building had been completed and fitted up in a costly style. The case was remitted from the High Court, and Mr. Lane ordered the demolition of so much of the building as stood out beyond the building line—roughly speaking, 150ft. by 7ft. The order was served on the builder, but though the Council allowed the matter to rest for twelve months, he made no move, and the Council undertook to do the work themselves. As the structure now stands, the 7ft. appear to have been cleanly cut off from end to end. Rafters and iron girders have been cut exactly to the building line. The depth of the structure is now only 13ft., and it is said to be entirely useless for any purpose. It has been shored up, but as one side of the whole length is open, a gale of wind will probably complete the work of demolition.

MR. ARNOLD MITCHELL, the assessor appointed by the Governors to adjudicate on the fifty-four schemes submitted in the competition for the new Grammar School, Dudley, has given his award as follows:—First premium, £50, to Messrs. Woodhouse and Willoughby, F.s. R.I.B.A., King Street, Manchester. Second premium, £20, to Messrs. Forsyth and Maule, Great Marlborough Street, London, W.

At the Sheffield School of Art, the exhibition of the students' works in the Mappin Art Gallery will remain open about a month. Special interest will again be given to the proceedings, in consequence of the school having gained a record position. It has this year two gold medals for Design. The student who heads the list this year is Agnes Kershaw, to whom the "Princess of Wales' prize of £25" is awarded, because she stands as first female student in the kingdom. Percy John Roberts takes the only gold medal awarded for a "modelled design," and the design, a fountain, would make a capital memorial. Messrs. Martin, Hall, and Company's prize produced a very good competition, and the prize work, a cup, by W. E. Wigfull, although only a slight drawing in charcoal, shows good feeling for artistic silver work. There is a very considerable number of designs for gold keys, and although they are not all of equal merit, are all up to the ordinary standard of manufactured productions, and some show great beauty and exceptional ability. Those by Omar Ramsden and J. H. Harmstone have been adjudged the best. Alice Wainwright's design for a

chatelaine, with champleve enamel, is pretty and practical. E. M. Lockwood's design for a China plaque, "Moonpennies in the Grass," is very original, and it is hoped to see this design carried out in the material next year. Frank Nowill shows studies of historic styles in iron-work and Architectural drawings. Eliza F. Chapman shows some needlework, together with the original design for same. The Alfred Chadburn prize winners this year are all students of the school, although the competition is open to anyone in Sheffield, irrespective of age. Only the prize drawings in this competition are exhibited, the space at disposal being so limited as to compel the non-appearance of a large number of the works of the students which are deserving of being exhibited.

A FEW additions have recently been made to the Continental Gallery in New Bond Street. Chief amongst them is the large painting by Professor Grosso, of Milan, called "The Last Rendezvous," which occasioned some controversy when shown at the first International Exhibition at Venice in 1895. It is a morbid picture, representing a "Don Juan" in his coffin in a palace chapel, and several women looking for the last time upon his face. The subject is anything but a pleasant one, while the conception of the theme and the rendering show a daring mastery of the brush and an independence as to the ethics of pictorial description. Amongst other contributions are some of Mr. A. Normann's views of Norwegian fjords, some of them extremely brilliant in colour and luminous in effect.

GREAT reticence is being observed at Guildhall with reference to the new offices of the Sewers Commission, and the matter from first to last is shrouded in mystery; but the "City Press" has reason to believe that a further hitch has occurred, and that the officers are afraid of making progress for fear of legal proceedings being taken on the ground of the infringement of light. There is certainly something in the air, or the work would be proceeded with in a far more businesslike manner than is actually the case.

In commemoration of the eightieth anniversary of the birth of Mr. G. F. Watts, an address of congratulation, signed by many of his friends and admirers, was presented to the distinguished artist last week at his residence, Little Holland House, by Mr. C. Hallé, Mr. Comyns Carr, and Mr. Leonard Lindsay, the directors and secretary of the New Gallery, where a collective exhibition of Mr. Watts' work is now being held. The address, handsomely illuminated on vellum, bore on the first page a sonnet to Mr. Watts, written by Mr. Swinburne. This was followed by a few lines of congratulation appropriate to the occasion, with the added wish that many years of life and work might yet be in store for the great painter and profound thinker to whom this tribute of esteem and affection was offered.

At last a register is to be prepared of the buildings of Historic and Architectural interest in London. Hitherto this work has only been undertaken in a piecemeal fashion by private organizations, but for the future the London County Council, acting in co-operation with the existing associations, will assume the responsibility and carry out the task on a systematic and comprehensive basis. We may thus hope, with some amount of confidence, that the ruthless destruction of buildings that serve to link the present with the past will be effectually prevented, and that whenever the despoiler shows his hand the Council will at once bring its influence to bear with a view to staying, before it is too late, the desecration of interesting memorials that have come down to us from former generations. Had such an organization been in existence within the last twenty years, we should still have around us many interesting relics of which, alas! we now possess only the memory. The City is so rich in such relics of the past that the Corporation might well interest itself, and compile such a register for its own use and the use of the community at large.

It is suggested by a contemporary that the time may come when Aberdeen may be overbuilt. "An excellent object-lesson on this subject could be got from Glasgow. Soon after the passing of the city improvement scheme in that city, there was such a rush to provide for displaced tenants that whole streets, and even whole suburbs of tenement houses, mostly of one, two, and three rooms, sprang up all round Glasgow in the late sixties and early seventies. The buildings were mostly of the speculative order, and for a time all went well, and the boom continued. A variety of circumstances, however, happened, which caused many a speculative builder to find himself in the bankruptcy court. First there was provided for a presumed displacement of 60,000 accommodation for at least 150,000, and instead of the displaced population going into the new houses, quite two-thirds of them huddled themselves into houses nearer their former abodes, preferably to suburban retreats. Then it was found that houses which had hitherto readily sold could not now be sold, with the result that building stopped, and a great many men were out of employment, and could not pay any rent. Other trades in the city became dull, and to add to the general depression the City of Glasgow Bank failed in 1878, with the result that the then normal population was reduced by 35,000 within a year. In Glasgow and suburbs quite 25 per cent. of all the house property was unlet during 1879, 1880, and 1881. Since then Glasgow has recovered, but thousands were ruined before the recovery set in."

THE ninth of the series of fortnightly lectures on Art subjects was delivered in the Liverpool Corporation Galleries on Saturday, the 20th ult., by Professor F. M. Simpson, of University College, whose subject was "The History of the Arch." The Professor began by saying that although the lintel form of construction is older than the arch form, the latter is more ancient than is generally supposed. It was known to and used by the Egyptians 3000 years before the birth of Christ. The most interesting discovery has been that of the gates of Khorsobad, in Assyria, which date from 721 B.C. Both the pointed and semi-circular-headed forms were used by the ancients, although the former shape was generally not constructed with radiating voussoirs, but with stones projecting one in front of the other, the joints being horizontal. The godfathers of the arch were really the Etruscans. From them the Romans learned it, and used it universally in their buildings. All the Roman arches were semi-circular, and were constructed on true arch principles. So were the arches used by the Byzantine and Romanesque builders. The pointed form reappears in the Saracenic work of the ninth and tenth centuries, and was adopted by the Mediaeval Architects to solve certain difficulties in construction—principally those of vaulting over oblong spaces. It was constructed properly with radiating voussoirs, but the old idea that the Gothic men invented the pointed arch is a mistake. At the end of the fourteenth century the arch became again semi-circular, and this continued until the Gothic revival at the end of the last century once more brought the pointed form into fashion.

A WISE step is being taken by the directors of the National Gallery in arranging that a special room shall be provided for the sale of approved copies of the masters. Both in England and in the Continental cities every day students are to be seen in the galleries endeavouring, by the rules of Art, to reproduce the effects of the almost magical touches of genius. How much they miss is very evident when the copy is near the original; but a work that is creditable under such circumstances passes the best test. Even an accomplished critic finds it difficult to carry away in his mind all the qualities of a famous painting, so as to be able adequately to tell the degree of fidelity. The action of the directors is the more desirable because, unfortunately, the persons who nowadays are most able to buy pictures are not the best

judges. The commercial instinct is, unhappily often developed at the cost of finer culture and when the opportunity comes for purchasing discernment is lacking. The new movement will afford poor artists a better chance than they have had of getting merit recognised. The "middleman," of course, will suffer; but he belongs to a class that is bound to be injured by the tendency of the times.

If St. Paul's is to be the point of all others on which the historic interest of the present year is to centre, there surely cannot be a better time for cleaning its west front, which has never undergone that process since it was completed during the reign of Anne. Everybody who remembers the appearance of the screen at Hyde Park corner a few years ago, and contrasts its appearance then with what it is now, can realise what the improvement would be if the splendid west front underwent a like process of cleansing.

SOME interesting additions to the National Gallery have just been announced. The most important is "The Yeoman of the Guard," by Sir John Millais, which has been bequeathed to the nation by the late Mr. Hodgkinson; and among the others are "A View of the Carrara Mountains," by Professor Costa, presented by a body of subscribers; "Christ and the Woman of Samaria," by the late George Richmond, R.A., a gift from the family of the artist; and E. M. Barry's competition design for the National Gallery buildings. If the proposed rearrangement of the national collections takes place when the Tate Gallery is opened, these pictures will probably be transferred to Millbank.

A CORRESPONDENT writes: In reference to recent remarks in The Daily News on the incomplete state of the South Kensington Museum, it may be added that this is only one instance of the "how not to do it" attitude adopted by the Department under a whole series of Governments. When Sir Gilbert Scott's great block of Government offices was built in Whitehall—the block in which the Home, the Foreign, and the India Offices are situated—it was proposed to carry on the Architectural composition across the west end of Downing Street, and to put up a similar block on the other side. The evidences of this intention are still to be found in the bald brickwork and the unfinished arches that appear beside the steps leading down on to the Horse Guards Parade. In a similar manner, when the Law Courts were at last completed, after many years of delay, there still remained an unkempt piece of derelict land on their western side that was for long the harbourage of old stones, decayed scaffoldings, and rusty ironwork. So well known did this spot become that it was familiarly called "Strand Common"; and it was not until some public-minded person, who desired to remain anonymous, gave a sum of money for laying out this space that it at length assumed its present gracious aspect. Other instances might be given: of how Sir Charles Barry's design for the completion of the Palace of Westminster yet remains unfinished, and how it was not until recent years that, when Mr. Pearson restored Westminster Hall, the unfinished pinnacles and spirelets of the north-east angle of the building were completed. But enough has been said to show that the powers that be have a genius for leaving things unfinished.

PREPARATIONS are being commenced for the new Royal yacht. The design will be entrusted to Sir William White, the Assistant-controller of the Navy, and some points in the existing *Victoria and Albert* are to be reproduced, probably the swan bow and square stern. The internal arrangements will be very materially altered, and the accommodation correspondingly increased. The new engines will be of increased speed, and with the very latest conveniences. It may be that the cost of the new yacht will partially, if not entirely, be covered by this year's estimates. The sum will be very considerable.

THE fire which occurred at the Cox-Thermo Electric Company's laboratory, St. Albans, resulted in the entire destruction of the buildings and their contents. The most serious loss is a personal one to Professor Cox, whose machines, valued at thousands of pounds, and the whole of the records of his experimental work, are destroyed. For ten years Professor Cox had devoted his whole energy to the elucidation of the means of using electricity for cooking purposes, and he had so far succeeded that everything was ready for placing the generators on the market.

An old relic of the past is about to disappear in Helmington Hall, situate between Hunwick and Willington. For many years the Hall has not been inhabited owing to colliery subsidences, and latterly two of the wings have been overhanging. To prevent an accident, the wings have been pulled over. The building is about three centuries old. Over the fireplace in the Hall kitchen there used to be a piece of old and curious carving, which was executed in bold relief. Amongst the permanent representations were four figures denoting the four quarters of the globe, and several animals indigenous to various countries.

A RECENT application to Mr. Justice Kekewich calls for passing notice on account of the importance of the question raised by it. The Architect of a building now in course of erection at the West End having reason to believe that the contractors were not using proper materials for the concrete floors, attempted to satisfy himself by personal inspection. This, he alleged, he was not permitted to do, as "the ladders were removed and a gang of men brought up to oppose any proceedings he might take under the contract." He therefore sought an injunction to restrain the defendants from interfering with him in the discharge of his duties, and also from using improper materials. The first part of the plaintiff's application was granted at once; though his Lordship did not see his way to grant an injunction restraining the contractors from using improper material, presumably for want of evidence that such an injunction was necessary. It is to be hoped that the conduct of the defendants in this case has been exaggerated, or that the refusal to allow permission to the Architect to make the required inspection was the act of irresponsible persons in the employ of the firm. There can be no question as to the right of the Architect to see that a contract is properly carried out, and that the reputation of a building firm is seriously compromised where any obstacles are placed in the way of his doing so. A City contemporary thinks the building trade is, rightly or wrongly, suspected of being sometimes less scrupulous than they should be in their adherence to the terms of their contracts, and that to refuse professional supervision is by no means the way to inspire the public with confidence.

A VERY pleasant little exhibition is that of "English Landscape," containing pictures and studies in oils by two ladies of kindred style, Miss E. Stewart Wood and Miss Annette Elias, arranged in two distinct, yet consecutive groups in the Graves Galleries, Pall Mall. Both of these skilful landscape painters may be described as belonging to the school of Mr. David Murray, but Miss Elias has more completely succeeded in emancipating herself from the influence of that popular painter than has her companion. Miss Wood gives in "A Flood in the Orchard" and "Runnymede Marshes" almost a *pastiche* of her master. Miss Elias chooses, as a rule, less striking subjects than Miss Wood, but she has a deeper feeling for nature and a greater felicity in the suggestion of atmosphere. It is a pity that her share of the exhibition could not have been made to include her best picture, "Burning Weeds," which was seen last summer at the New Gallery.

THE additions which have been in course of construction at the Central Savings Bank have now been completed, and compensation

to the extent of £2200 has been paid to the Dean and Chapter of St. Paul's for the exclusion of light from portions of the chorister's school. The whole of the staff is now under one roof, instead of the various offices scattered up and down Queen Victoria Street, which the Post Office authorities have been obliged to secure from time to time owing to expansion of work.

A CONTEMPORARY says the election of new members to the Old Water-Colour Society ended in a *fiasco*. Under the laws as they at present stand, no candidate can succeed unless he obtains a majority of the voting power. Now, as the members consist of but thirty-five, and several of these are every winter incapacitated owing either to age or illness, it is very difficult to get a quorum, and this was the case a few days ago. The candidates numbered nearly eighty, and their works, which covered the walls of the gallery, will have to be reassembled at a more propitious time. One good result may ensue from this inconvenience—namely, that the senseless law which at present prevents associates from having any part in elections may be abrogated. At the Royal Academy associates vote, and why not therefore at the Water-Colour Society?

THE Committee charged with the duty of selecting the sculptor of the proposed statue of the Queen in Dundee has decided to place the commission in the hands of Mr. Harry Bates. The cost, including the pedestal, was stated to be £2500. The design will show her Majesty seated. Cast in bronze, with *bas reliefs* of the same material, the statue will rest on a granite pedestal. The foundations will, of course, be supplied to the artist free of cost. The subjects of the *bas reliefs* will be the coronation of Her Majesty, her marriage, and her landing in Dundee in 1844. The fourth has not yet been determined upon.

MR. JOHN TWEED, of Chelsea, a young Artist of the Glasgow School, has been commissioned to execute the statue of Mr. Cecil Rhodes, which is to be placed in Buluwayo. Mr. Tweed has just completed a colossal statue of Van Riebeck, the first Dutch governor of the Cape, which is now being cast at the foundry at Thames Ditton. He also executed the pediment on Mr. Rhodes's house at Rondebosch representing the first landing of the Dutch at Capetown, and he has in hand for the ex-Premier of the Cape a magnificent memorial depicting, in life-size, some of the more stirring scenes in the last stand made by Major Allan Wilson and his ill-fated party.

APROPPOS the South Kensington Museum, Mr. Aston Webb writes to the Times as follows:—"May I be allowed to say that I am of opinion that a large amount of inside decoration would be quite out of place in such a building? The report which accompanied my design explained that the walls of the courts and galleries had been purposely left without Architectural embellishment, being arranged solely with the view of placing objects upon them, decoration being confined to the entrance-hall and staircase; a view of this latter portion only has been published, and may, therefore, have been misleading as to the general character of the interior design. After my formal appointment as Architect in 1891, the internal planning of the building was very carefully considered in conference, both with the Office of Works and the Museum authorities, and I was further considering the exterior design when the drawings were stopped, and I have since been anxiously waiting instructions to proceed. That the best Architecture for a museum is that which interferes least with the objects shown, and that good lighting and planning should be the leading considerations for such a building is perfectly true, but I venture to think that beyond this it is the duty of the Architect to remember that he is entrusted with the erection of a great national building to shelter some of the nation's greatest Art treasures, and that he would not be properly fulfilling his duty by the provision of a mere utilitarian structure.

THE picturesque ruins of Pluscardyn Priory, Elginshire, stand on the verge of a quiet rural valley in the Laigh of Moray, and are protected from the North Sea by a long ridge of hills now thickly planted with fir. The Priory presents attractions not to be found in ecclesiastical ruins of more ambitious pretensions. It may not possess the grandeur of Elgin's Cathedral, nor the magnificence of that of Melrose, and it may lack the historical renown that clusters around Holyrood; yet it has distinct charms, peculiarly its own, and may claim consideration with any one of these named on account of its secluded situation and its picturesque beauty. The attractiveness of Pluscardyn Priory does not lie altogether in the form which its designer gave to it, nor in the richness of its carvings, nor in the elegance of the traced mullions of its pointed windows, but in all these combined, enhanced as they are by the enrichment of the covering of ivy which the hand of nature has been weaving around it for centuries—an enrichment not in the original plan, nor ever dreamt of by its Architect. The priory was founded in the 13th century, and was originally inhabited by a French Brotherhood, the "Val des Choux," a monkish Order which possessed two other houses in Scotland, at Ardchattan and at Beaulieu, but was not represented among the eight Brotherhoods that owned religious houses in England. Pluscardyn was inhabited by the Brothers of this Order up to the year 1454, when they were displaced to make room for the Black Dominican monks of the neighbouring Priory of Urquhart, who received a grant of Pluscardyn with all its lands. Queen Mary made a gift of the Priory and its possessions to the notorious Alexander Seton, then in his boyhood and preparing for the Church. Since then it has been in possession of a number of notable Scottish families. In 1709 it was purchased by William Duff, of Dipple, the ancestor of the Duke of Fife, and during nearly two centuries it has been in the possession of the Fife family as it is at present. The part of the Priory used for public worship was originally the Frater Hall. The dormitories, situated on the story above the Church, made a commodious ballroom for the district. The pulpit, which is of carved antique workmanship, was originally the pulpit of St. Giles' Church, Elgin, and was presented to that city, along with a "gallows," by the Lords in Council.

PARK LANE is becoming the home of millionaires from South Africa. Mr. Barnato's house at the corner of Great Stanhope Street is nearing completion, and still more nearly completed is the house being built for Mr. Beit by Messrs. Balfour and Turner. It occupies the whole plot of ground between Aldford Street and South Street, and fronts both on Park Street and Park Lane. It would puzzle an expert to say exactly the style in which the house is designed, for it partakes of Gothic and classic features in equal proportions. It is built entirely of Portland stone, with semi-classical columns of black, unpolished Alfoa granite flanking the entrances, and is roofed with green slates. The wall enclosing the grounds is finished off with iron railings of Renaissance character wrought with a curious disregard of the superfine finish usually demanded, and they consequently have a very unusual appearance. The decorative panels of the exterior walls have been sculptured by Mr. Harry Pegram, while the general carving of the interior is the work of Mr. L. A. Turner. A chief feature of the house is the winter garden, which, with the billiard room adjoining, was not included in the original plan, the plot of ground on which both stand not having been purchased in the first instance. The low, rambling aspect of the whole building is the result of restrictions imposed by the Duke of Westminster, on whose estate it is situated.

THE scheme of the Leeds Corporation for dealing with the property located upon what is now familiarly known as the Marsh Lane and York Street insanitary area is month by month assuming a more definite shape. The

various properties to be demolished are now all mapped out, a broad new street is to be cut right through the area, and Marsh Lane and York Street are to be widened to about 60 feet. The provision of houses for those who are displaced by the demolition of existing property in the area is the question now occupying the attention of the Insanitary Areas Committee. Before the Corporation can commence to clear away any of the insanitary dwellings they must provide housing accommodation for at least 500 people. The committee has already practically decided as to the class of dwellings to erect, but before any step can be taken in this direction their proposals have to receive the approval of the Local Government Board. The committee desires to make a start by building a block of tenement dwellings sufficiently large to accommodate about a hundred persons. The site selected is one lying between Brick Street, St. Peter's Square, and York Court. Plans of these proposed houses have already been prepared. The houses are shown to be arranged in four flats, and in front of the three upper flats outside balconies run the whole length of the block. The doors of the houses open on to these balconies, the latter being approached by steps, which are also unenclosed. It is possible that a second block of this character may be erected, also within the area, but nothing definite has yet been decided on that matter. After all, when it is remembered that the Local Government Board requires the Corporation to provide accommodation altogether for 2,000 people, the building of a small block of dwellings may be regarded as a mere detail. The committee desires to build the majority of the dwellings that will be required on the Ivy House Estate, which adjoins the East End Park. Here, within about three-quarters of a mile from the insanitary area, are 14 acres of very suitable building land available. The class of dwellings proposed to be erected on this land are through houses.

A LECTURE on "The Architecture of Asiatic Hellas," one of a series on Hellenic Architecture, was delivered in the Glasgow School of Art last week by Mr. W. J. Anderson, A.R.I.B.A., director of the Architectural department, to a large audience of students. After a brief survey of the geography of the coasts settled by the expatriated Ionians and Eolians, and the history of Asia Minor in its relation to the Arts, the lecturer proceeded to trace the growth of the "Archaic" Greek style in that region, by whose traditions the settlers were largely moulded. The influence of Phrygia, e.g., in its cult of a Supreme Mother, Cybele, through whom all descent was traced, appears to have determined that nearly all the great Ionic temples were dedicated to goddesses, and the Ionic style as a whole represents what may be called the feminine side of Greek Art. In the severe Doric and the lighter Ionic styles we have the happiest possible symbol of the two great elements of the Greek people, whose rivalry makes the history of Greece, and who seem to have been complimentary one to the other. The *temple in Antis* was traced to the *megaron* or men's apartment of the palaces of Troy, Tiryns, and Mykene, and before 550 B.C. its peripteral arrangement was fixed, and its structural evolution was complete, the talents of succeeding Architects being directed only to its modification by refinements in detail and sculpture. Examples of the Archaic style were supplied in early votive columns, and by the earlier temple of Diana at Ephesus, of which there are fragments in the British Museum; while the great temple of Paul's time, built in the fourth century B.C., was shown as now restored by Dr. A. S. Murray, and the famous sculptured drums and pedestals as they have been arranged under his directions. In conclusion, a series of restorations of another wonder of the ancient world, the mausoleum of Halicarnassus was shown by lantern, including that of Professor Cockerell, and a more recent one by Mr. J. J. Stevenson, which appears better to satisfy the requirements of Pliny's description with the actual relics now arranged in the mausoleum room of the Museum.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

At a general meeting of the Royal Institute of British Architects, held under the presidency of Professor G. Aitchison, A.R.A., on Monday evening, Mynheer R. J. H. Cuypers was elected Royal Gold Medallist for the current year, "subject to Her Majesty's sanction."—Mr. Owen Fleming moved, "That it be referred to the Science Standing Committee to consider the advisability of formulating a definite standard size for bricks."—Mr. Hooper seconded, and the motion was carried.—Mr. Woodward called attention to the new conditions of building contracts, adducing testimony to show that in several instances builders had refused to agree to the new conditions, and, appealing to the Institute to revert to the old form of contract, which, he said, was excellent and answered every purpose.—The Chairman said that all they could do was to have Mr. Woodward's remarks printed in the journal.

#### KEYSTONES.

TOWARDS the widening of Westbourne Park Bridge the Works Committee of the Paddington Vestry recommend the latter to contribute a third of the £17,628 estimated as required, providing the London County Council and the railways concerned defray the remaining two-thirds.

MR. F. H. TULLOCK, on behalf of the Local Government Board, has held an inquiry into an application by the Nelson Town Council for a provisional order to alter and amend certain of the local Acts, so as to enable the Corporation to borrow additional monies for purposes of the market undertaking.

MR. ROBERT CRAWFORD, engineer to the Greenock Harbour Trust, who was asked to report on the proposed extension of graving-dock accommodation, estimates that it will take about £35,000 to widen, alter, and lower the bottom of the dock, and that it would take at least fifteen months to carry out the alterations. On the question of constructing an entire new graving-dock, at an estimated cost of £90,000, the Harbour Trust is not satisfied that there is any possible traffic sufficient to warrant such a large expenditure.

The ill-fated old chain pier of Brighton is no more, but Mr. J. Aumonier has made it memorable by forty water-colour drawings, exhibited at the Dowdeswell Gallery.

The Aberdeen School Board has approved the action of Professor Robertson, the Chairman of the Board, in asserting the Board's right to proceed with the erection of the new elementary school on the Grammar School grounds, in respect that the Town Council had not within a month expressed approval or disapproval of the plans.

A new United Presbyterian Church is to be erected at Hurlford at a cost of £2000.

The Renfrew and Clydebank Joint Hospital, situated at Blawarthill, near Yoker, and erected by the burghs of Renfrew and Clydebank and the Renfrewshire County Council, has been formally opened. The buildings are in the cottage style of Architecture, and are fitted up with all the modern appliances. The total estimated cost is about £10,000.

A new Miners' Hall was recently opened at Backworth Colliery. The hall is a plain but substantially-built brick building situated near the Workmen's Institute on the Backworth turnpike. Externally, its appearance is unpretentious, but the inside appointments are comfortable and commodious. The building is divided into two sections, one part comprising debating and committee rooms, and the other a large hall.

MR. HARVEY DU CROS has purchased the detached house at the corner of Palace Gate, facing Kensington Gardens, London, together with a vacant plot of ground of one acre adjoining, for £60,000. It is understood to be Mr. Du Cros's intention to demolish the existing house and to erect a residence on the site.

A LIMITED liability company has been formed at Torquay for the purpose of constructing an electric railway or tramway between that town and Paignton.

GREAT alterations are contemplated at the Inverness Railway Station, which has for years been unsuitable for the passenger and goods traffic. Plans have been prepared, and the intention is that the present shop used for locomotives shall be removed to Needlefield, on the Longman Road, so as to permit of the Company utilising and giving the benefit of steamer facilities to through travellers.

THE Lancaster Town Council has resolved to recommend the purchase of a piece of land in Dalton Square, containing about 5500 square yards, for public purposes, as a memorial of the Diamond Jubilee. What is to be done with the land is not decided, although the suggestion has been made of erecting a large public hall as a part of a more comprehensive scheme of municipal buildings, to be carried out at a future date.

THE Duke of Bedford having granted permission for a drinking fountain to be erected outside the west wall of Drury Lane Theatre, close to the principal entrance, as a memorial to the late Sir Augustus Harris, a meeting of the Memorial Fund Committee was held recently at Covent Garden Theatre, when a sketch of the proposed fountain was submitted. It was decided that the work should be put in hand by a sub-committee after further designs had been obtained.

At the last meeting of the General Purposes Committee of the Wrexham Town Council, the Mayor announced his intention of giving £500 to the town to assist in providing a new town hall, a public park, or a recreation ground—whichever the Council decided was the most urgently needed.

THE total of the subscriptions received from leading engineering firms of Manchester, Salford, and the surrounding district for the enlargement of the Whitworth Engineering Laboratory at Owens Park amounts to £1085. Messrs. Crossley Bros. have presented an oil engine for experimental purposes.

At Wolverhampton the sum of £5000 has been subscribed towards the cost of erecting a new Free Library building to commemorate the sixtieth anniversary of the Queen's reign.

THREE hours were spent in the House of Commons in discussing the bill promoted by the London County Council for the acquisition of land at Charing Cross for the erection of Municipal Buildings. The site, it was explained, would cost £813,000, and the buildings £500,000. The rejection of the bill was moved by Mr. Boulnois on the ground of the extravagance of the scheme, and was carried by 227 to 146.

As a memorial of the late Rev. Josiah Viney, it is proposed to add "A Viney Memorial Wing" to Caterham Congregational School. The wing will contain a laboratory, and the estimated cost is £2000.

MR. GEORGE ARMSTRONG, of Wolverhampton, locomotive superintendent of the Great Western Railway, has just retired from the Company's service, to which he has been attached about half a century.

THE Council of the Aberystwyth University College has decided to spend £15,000 in finishing the erection of a new wing to the college buildings.

In digging a trench in King Street, Covent Garden, by Garrick Street, some workmen came upon several lengths of the old wooden water pipes, which were made from trunks of trees.

In the course of some building operations in Thames Street, Windsor, the remains of an old Roman well have been discovered, and a walled-up aperture was found beneath the pavement. It is supposed to have at one time led to an underground passage at Windsor Castle.

At Salford the School Board has decided that a school of two departments (girls and infants) be built on the London Street site, such school to provide sufficient accommodation for the girls and infants attending the Charles-town and Broughton Road Schools, and to be capable of enlargement or extension.

MR. BROCK, R.A., has received a commission to execute in bronze an equestrian statue of Edward the Black Prince. The work, with the granite pedestal, will be about 25ft. in height, and it will, when finished, be erected in front of the Post Office at Leeds.

## Professional Items.

**ABERDEEN.**—The Links and Parks Committee of the Aberdeen Town Council met on the 24th ult. The remit from the Council as to providing additional bathrooms at the Bathing Station, and also as to the necessity for constructing a swimming-pond in connection with it, was under consideration. Plans were submitted by Mr. Rust, City Architect, showing eight additional ordinary baths, a fully-equipped Turkish bath, and a swimming-pond. Mr. Rust estimated the cost of the whole scheme at £5500. The Committee generally approved of the plans submitted.

**ARMLEY.**—At Armley a new hospital has been opened by the Board of Guardians. The buildings, which are plain and substantial in design, comprise hospital and administration block, faced with pressed bricks, with stone dressings, relieved by Gothic gables. The whole of the interior of the buildings is fitted with the latest improvements. The Plenum system of heating and ventilation—of Messrs. Ashwell and Nesbit, of Leicester and London—has been introduced. Covered gangways connect the old hospital with the new premises. In summer these gangways will be uncovered, and the space utilised as an airing-ground by the patients. The lavatories have been fixed in "offshoots" from the main building, whose floors and wall are fire-proof. The total cost of the scheme is £10,000. Mr. Paul Roads, of Skinner Lane, Leeds, was the contractor for the brick and stone work; Messrs. Mason and Son, Woodhouse Lane, Leeds, carrying out the carpenters' and joiners' portion. The area covered by the old and new buildings is about an acre and a half.

**BISHOPTHORPE.**—The Vicar of Bishopthorpe has lately received promises from two anonymous donors of £300 and £50 towards the new Church, on condition that the work is begun this year. To this the Archbishop of York has added £100, making his contribution in all £600. The committee has decided to make a beginning this spring. About £4500 is required to complete the whole. The Architect is Mr. Hodgson Fowler, of Durham.

**BLOWICK, NEAR SOUTHPORT.**—In a limited competition for a new Wesleyan Church, the designs of Messrs. Green and Brockbank, of Adelphi Bank Chambers, Liverpool, have been placed first, and accepted. The Church will cost about £3500, and will be built of brick with stone dressings, seating accommodation being provided for about 850 worshippers.

**BOLSOVER.**—At a recent meeting to consider and decide what steps should be taken towards the restoration of the Church, which was destroyed by fire a few weeks ago, Mr. Louis Ambler, of London, who is the Architect engaged, submitted plans which he had prepared. There were two schemes suggested:—No. 1, to erect a building on the same lines as the old one, the estimated cost of which was £6500, including seating, gasfitting, organ, bells, and other requisites. No. 2 scheme provides for some enlargement and extra seating accommodation for 220 persons. The estimated cost in this case was £9000, inclusive. Both estimates included the cost of restoring the chancel, which the Duke of Portland had promised to do. It was resolved that No. 2 scheme be adopted, and a large committee was appointed to assist in carrying out the work.

**BRAMLEY.**—The work in connection with the erection of the new hospital at Bramley, the opening of which took place a few days ago, was carried out under the supervision of Mr. C. F. Wilkinson, Architect, of Park Square, Leeds.

**CROSLAND MOOR.**—The United Methodist Free Church at Crosland Moor has just undergone an extensive alteration. An entirely new pulpit, with the exception of the centre panel, has been provided; a new communion has been

railed off, and other improvements have been made. The contractors were: Joiner, Mr. Geo. Ainley, Crosland Moor; painter and decorator, Councillor Thos. Cartwright, Crosland Moor; glazier, Messrs. Thos. Allison and Co., Limited, Milnsbridge; masons, Messrs. W. Boothroyd and Co.; and Mr. F. Milan, Lockwood, has seen to the reconstruction of the heating apparatus and the provision of a new boiler. The total cost is estimated at from £400 to £500.

**DUNDEE.**—A stained-glass window has just been erected in St. Andrew's Pro-Cathedral, Nethergate. The window, which consists of two lights, and is situated in the south-west corner of the Church, is a fine example. In the bottom panels there are representations of St. Joachim and St. Anne, the mother of the Virgin; and St. Joseph, the Blessed Virgin, and the child Jesus. Messrs. Mayer and Co., Munich, executed the work. The extensive improvements on the Church have now been completed. Mr. Joseph Thomson, Nethergate, superintended the painting of the building and of the altar of the Sacred Heart.

**EDINBURGH.**—At a meeting, on the 17th ult., of the Lord Provost's Committee of Edinburgh Town Council, the report of a sub-committee on the North Bridge Street reconstruction was considered. The sub-committee recommended that the elevation plans for the reconstruction of the buildings on both sides of the street, submitted by Messrs. Scott and Williamson, Architects, whose designs were adjudged first in the competition, should be adopted, with such modifications as the Council might think necessary. Failing satisfactory offers from outside parties to undertake the work, in whole or in part, at their own risk, the sub-committee were of opinion that the reconstruction should be executed by the Corporation itself. The Lord Provost's Committee approved of this report, and decided that working plans for the corner blocks be prepared and estimates obtained.

**GATESHEAD.**—The contract for the reconstruction of the Redheugh Bridge has been let. The successful tenderer is the firm of Sir W. Arrol. The time in which the contract is to be executed is about two years; and we believe that, though the exact amount of the contract has not been stated, it is about £80,000.

**GOLBORNE.**—The new building recently put up in Worsley Street, consists of one large room, 34ft. by 24ft., on the left, and a spacious cloak-room, with teachers' room, on the right. The school has good light and admirably ventilated. The windows are fitted with Leggott's patent fasteners, the windows opening at top and bottom. The Architects were Messrs. Simot and Powell, of Liverpool, and the builder Mr. Jas. Wakefield, of Golborne.

**LARGS.**—Mr. R. W. Friday, of Trigony Hall, having bought a block of property at the head of Main Street, intends pulling it down, and erecting a new tenement, to cost from £8000 to £10,000. Mr. Friday intends putting the building line back some 4ft. at the west end so as to bring it into line with the nearest property.

**LEICESTER.**—The restoration of the south aisle of St. Nicholas' Church has just been completed. About £750 has been spent on this scheme. The brickwork of the east and west windows and three of the south windows have been taken out and replaced with stone; the walls of the aisle have also been replaced almost entirely with granite, the pews have been revarnished, and new heating apparatus put in. The old vestry has also been removed, and the new one occupies a place at the end of the north aisle and behind the organ. This has opened out the south aisle, and the full length of the Church can now be seen, making a considerable improvement in the general appearance. In addition, the east end of the south aisle has been fitted as a side chapel for week-day services. It is further contemplated to take in hand the restoration of the tower, which will necessitate the removal of the

modern brickwork and substituting stonework, the idea being to restore the fabric as far as possible to its original appearance. The cost of this work will possibly amount to £1000.

**LUNDY ISLAND.**—The new Church which is being erected at Lundy Island is now almost complete. The edifice is of thirteenth century Early English style. The building, on plan, consists of nave, chancel, with north transept, intended as an organ chamber, and vestry. The lower part of the tower (which is 70ft. high) does duty as an entrance porch, and there is a square turret at the south-east angle of the tower, which gives approach to the belfry, in which is to be a peal of musical bells, not yet *in situ*. The roofs are of steep pitch, and formed of split stone slabs of Tetbury stone, Gloucestershire, and are crowned by red ridges; the cornice angles of tower and turret are defined by projecting gargoyles, and there is a fair amount of stone carving to the labels of windows. The principal material used is finely-axed grey granite, with dressings from the Doulting Quarries in Somersetshire. The clock faces north, and stands in the tower. In a niche on the same face of the tower is a large statue of St. Helena, the work of Mr. Harry Hems, of Exeter. Mr. John Norton, of Ridgemount Gardens, W.C., is the Architect. The interior walls are lined with red brick throughout, relieved by bands and diaper of blue Staffordshire and cream-coloured Marland bricks. The east window is a three-light one, and filled with stained glass by Messrs. Clayton and Bell, of London. The roofs are wagon-shaped and open. The contractors for the general work are Messrs. Britton and Pickett, builders, of Ilfracombe.

**MERTHYR.**—The Merthyr General Hospital has been extended by the recently-completed addition of an accident ward on the western side. The designs of the late Mr. T. C. Wakefield were accepted, and in May, 1894, the contract was given to Mr. Richard Lloyd, of Cefn, whose tender was £1160. The Architect died before the work had far advanced, and after his death its supervision was undertaken by Messrs. James and Morgan, of Market Square Buildings, Merthyr, and also of Cardiff. Externally, the ward is built of red and buff Ebbw Vale bricks, with Loughborough stone dressings, and is quite in keeping with the main block. The entrance is from Gwaelodgarth Lane. The door opens into a spacious vestibule, floored with encaustic tiles, and fitted with hot and cold baths, the windows by which it is lighted being of stained glass.

**NEW BUCKENHAM.**—The new chancel of New Buckenham Church was formally opened by the Lord Bishop of Norwich a few days ago. The chancel has been entirely restored by Messrs. W. T. Newson and Sons, builders, East Harling. Two stained-glass windows have also been put in.

**NEWSHAM.**—On February 20th was publicly opened at Newsham the new institution which the workmen at the village have caused to be erected for the purposes of a reading-room and recreation hall. The building, which is situated alongside the North-Eastern Railway Company's Morpeth branch line, has been erected from plans executed by Mr. John Golding, jun., of Blyth. The building contains on the ground floor a large hall, 32ft. by 24ft., fitted with two billiard tables; and on the first floor a news room, 21ft. by 24ft., and a smoke room 10ft. 3in. by 15ft.

**OLDHAM.**—The Markets and Baths Committee has been empowered to borrow £9000 for the erection of new baths at Robin Hill. Of this sum £7450 will be required for building, and £1550 for laundry and engineering work.

**SPALDING.**—In the competition for the enlargement and additions to the Corn Exchange, including a new butter market, permanent stage (with proscenium), and retiring rooms, for which a prize of £15 15s. was offered, eight

Architects competed, and at a special meeting of the Urban District Council the plans submitted by Mr. J. B. Corby, Architect, of Stamford, were accepted. The estimated cost is £1975, and Mr. Corby has been instructed to carry out the work.

**STANFORD.**—Six stained-glass windows have just been completed in Stanford Church, the work having been carried out by Mr. C. Powell, of London. On the north side of the nave of the Church there are two of the windows, with figures representing St. Aidan, St. Colomba, St. Hugh, and St. Chad; two saints in each. The chancel has been adorned on the south side with two other windows, representing the four evangelists. The cost has been about £100.

**STOCKPORT.**—At a committee meeting held on February 22nd the subscribers to the Stockport Infirmary decided to suitably commemorate the Queen's record reign by enlarging and improving the present building. Messrs. Woodhouse and Willoughby, of Manchester, were selected as the Architects to carry out the same.

### SOCIETY MEETINGS.

**The Society of Architects.**—The annual dinner of this Society was held at the Hotel Cecil on the 23rd ult., with Mr. Robert Walker (president) in the chair, and the Bishop of Stepney, Judge Emden, Mr. J. A. Rentoul, LL.D., M.P., Professor Banister Fletcher, Mr. Candy, Q.C., and Mr. M. Baldwin, M.A., among the conspicuous guests. After dinner, and the usual loyal toasts, the Chairman said that the object of the Society was to raise the standard of Architectural Art and to diminish the number of irregular or unqualified practitioners. Mr. J. A. Rentoul, M.P., the Bishop of Stepney, and others responded to toasts submitted by the chair. Mr. Walter Emden, J.P., Mr. A. A. Hudson, Mr. W. H. C. Payne, Professor Banister Fletcher, Mr. S. Trevel, and Mr. Lovegrove also spoke.

**British Archaeological Association.**—At the meeting held at the rooms in Sackville Street, Piccadilly, on Wednesday, Feb. 17th, Mr. Compton, Vice-President, in the chair, a paper entitled "London under the Monastic Orders" was read by Miss Edith Bradley, which was well illustrated by maps of the City, indicating in different colours the sites of the many religious houses which existed, both within and without the walls, between the 13th and 16th centuries. Miss Bradley noticed in detail many of the houses, arranging them in groups under the orders to which they belonged thus: the Benedictines, the Cistercians, the Carthusians, the Augustine Canons; and the three orders of Friars were each in turn described, and the circumstances of the foundation of the several houses were related. The Cistercians apparently possessed but one Abbey in London, that of St. Mary Grace's on Tower Hill, founded by King Edward III. in 1349. He called it "Eastminster," in contradistinction to Westminster. The King and his grandson richly endowed it, and it was regarded as of great importance, notwithstanding which only the very scantiest knowledge of it remains. It was surrendered in 1539, and was valued at £602 11s. 6d., according to Speed. The names of its two earliest Abbots alone are known—William de Sancta Cruce, 1349, and William Warden, 1360. The site it occupied is now covered with bakeries for the Royal Navy—not a trace or fragment of its walls remains. It is not generally known, but it is stated on authority according to Miss Bradley, that even Westminster Abbey had a very narrow escape from similar destruction at the hands of the Protestant vandal, the Protector Somerset, when he required stone for the building of his palace in the Strand; this, however, he obtained by demolishing instead the Priory of St. John, Clerkenwell.—The paper was listened to with great interest, and conveyed a good impression of the power and influence wielded by the religious orders in London, and showed what a large share they must have had in the

making of the history of our great City during the mediæval centuries.—At the conclusion of the paper the Chairman expressed what he felt was the feeling of all present, the obligation they were under to Miss Bradley for the comprehensive and Catholic spirit in which she had treated her subject and brought so prominently forward the great benefit which the monastic orders conferred on the country in preserving religion and learning in times when, but for their existence, the country would have sunk into barbarism and gross darkness.—A very animated and interesting discussion ensued, in which Mr. Blashill, hon. treasurer, spoke of the value of the ordnance maps in identifying the sites of the religious houses, and in other ways enabling us to illustrate the life of the old City.—Mr. Patrick, hon. secretary, pointed out that the great fire, although destructive of the majority of the Churches of old London, yet much of their walls must have remained standing, and their foundations, of course, were untouched, and in that connection it is interesting to know, on the authority of Mr. Geo. H. Birch, that the present Church of Christ Church, Newgate Street, is built upon the actual foundation walls of the eastern portion of the old Church of the Grey Friars Monastery, the nave of which extended considerably further to the west, covering the site of the present burial ground.—Dr. W. de Gray Birch made many interesting observations on the methods of giving land in the middle ages.—The Rev. J. Cave Browne, Rev. H. J. Dukinfield Astley, Mr. S. W. Kershaw, Mrs. Collier, and the Chairman joined in the discussion.

**Sheffield Society of Engineers and Metallurgists.**—At the Technical School on the 22nd ult., Mr. W. Watts delivered a lecture to the members of the Sheffield Society of Engineers and Metallurgists on "Rolling and Rolling Mills." The chair was occupied by Mr. S. E. Howell.

**Edinburgh Architectural Association.**—On Saturday last, the second visit of the Session took place to the North British Distillery, Gorgie Road. The members inspected the Maltings, Henning's Pneumatic Drum at work, the Grain Stores, the Mills, Mash House and Cooling Room, &c.

**The Institution of Civil Engineers.**—At the meeting on Tuesday, February 23rd, Mr. John Wolfe Barry, the President, in the chair, two communications, on "The Main Drainage of London," by Messrs. W. Santo Crimp and J. E. Worth, and on "The Purification of the Thames," by Mr. W. J. Dibdin, were read. In the first paper was described in detail the works carried out in London for the purpose of intercepting the sewage, which formerly passed directly into the river, and conveying it to outfall works at Barking and Crossness, about fourteen miles below London Bridge. The works designed by the late Sir J. W. Bazalgette, and carried out by him for the late Metropolitan Board of Works, comprised the construction of about 110 miles of intercepting and storm-relief sewers, the former having a final discharging-capacity of about 540,000,000 gallons per day, about 2.7 times the present dry-weather flow. There were two main pumping-stations on each side of the river, with machinery of an aggregate of 3,000 h.p., capable of pumping 500,000,000 gallons per day, and a like number of storm-water pumping-stations, capable of pumping directly into the river 150,000,000 gallons per day. The latter were used for preventing flooding in the lower parts of the Metropolis when a heavy fall of rain occurred at or about the time of high water, when the storm outlets were closed by the tidal water. The works undertaken by the London County Council to improve the pumping machinery by compounding the steam-engines at the principal pumping-stations were also described. The outfall works for the purification of the sewage, the dry-weather flow of which now exceeded 200,000,000 gallons per day, were next dealt with. The experimental filters for dealing with the effluent, and capable of effecting a purification of 78 per cent, were mentioned. The question of flood discharges from an area fully built over was referred to, and the details relating to an area of 160 acres were given.

The bearing of this question upon the "Separate" system was next referred to, and it was stated that, so far as London was concerned, the system was impracticable.—In the second paper, the Author described first the steps that had been taken in accordance with the scheme adopted by the late Metropolitan Board of Works for the treatment of the London sewage at the outfalls at Barking Creek and Crossness; secondly, the effect of that work in freeing the river from raw sewage; and thirdly, the best method of effecting still further improvement.

**Surveyors' Institution.**—At the ordinary general meeting of the Surveyors' Institution, held at the temporary address, Savoy Street, Victoria Embankment, the adjourned discussion on Mr. J. Willis Bund's paper on "Allotments and Small Holdings," read at the last meeting, was resumed.—Mr. D. Watney presided.—Mr. Sobin opened the discussion by remarking that the charge for land, stated by Mr. Bund at 40s. per acre, was too high; that good land in his county could be got for 33s. 6d., and deducting rates, &c., would bring it down to less than 30s. per acre. With regard to the acquisition of land, there needed an alteration in the Act, which he said was cumbersome, clumsy, and dilatory. He suggested that some plan should be devised to allow the tenant to put up some building convenient for storing tools, &c., without compelling the landlord to take the same.—Mr. Herbert Smith, agent to Lord Lansdowne, said that in Wiltshire there was the largest system of allotments of any county in England. On the Bowood Estate allotments had been made, all to the advantage of the tenant, and it was supposed the rural population would remain stationary; but the fact was that there had been an enormous reduction in the population. Town had its attractions. Farming was slow, and had not the life in it, and people hoped to earn more money, and so allotments were being gradually given up.—Mr. Wright, of Nottingham, said the Act wanted consideration. The compulsory power should never be used; he had always come to terms without the Act being put into operation. There was no actual desire for land by the bona-fide labourers; what they wanted was better homes and gardens.—Mr. Shaw spoke on the necessary alteration in the Act and of his experience as to allotments, which he believed had done good, but the best thing was to give the people a good cottage and a bit of garden.—Mr. Luere, of Huntingdon, spoke, and Mr. Bund shortly replied.

The annual dinner of the members of this institution was held on Wednesday, February 24th at the Hotel Cecil, under the presidency of Mr. Daniel Watney. About 270 guests were present, including Mr. Courtney, M.P., Mr. C. Oakley, Mr. T. M. Rickman, Mr. Justice Grantham, Mr. C. J. Shoppee, Sir P. Rose, Mr. A. Vernon, Judge Philbrick, Mr. C. Bidwell, Mr. R. Vigers, Mr. J. Collings, M.P., Mr. A. Garrard, Mr. Justice Wright, Mr. J. F. Rolleston, Sir C. E. Boyle, Mr. A. Buck, Sir J. W. Whittaker, Mr. H. T. Steward, Prof. Aitchinson, Mr. T. Wainwright, Mr. G. Langridge, Mr. A. Waterhouse, Mr. W. Wright, Mr. R. W. Richards, Mr. J. W. Fair, Mr. N. C. Macnamara, Mr. Thiselton Dyer, and Mr. F. K. Munton.—Mr. Courtney, M.P., replying for "The Houses of Lords and Commons," thought that the latter House was the original "Surveyors' Institution," for it surveyed mankind from China to Peru.—Mr. Justice Grantham and Mr. E. J. Castle responded for "The Bench and Bar" respectively.—Mr. G. de L. Willis proposed the toast of the evening, remarking that the membership had risen from 200 in 1869 to nearly 2800. The Institution practically covered the whole of the kingdom, and it had received Parliamentary recognition in the new London Building Act. This year 400 candidates were examined for the Institution certificate. The new building to be erected in Great George Street would cost £30,000, and the library contained 7000 volumes.

**Aberdeen Ecclesiological Society.**—The Ecclesiological Society recently met in St. Mary's Chapel, East Church.—Mr. A. R. Mackenzie, Architect, described to the meeting,

with the aid of original drawings, the interesting "find" of a portion of the outer wall of the cloisters of Greyfriars Church, in connection with the demolition of the old houses in Longacre.—The President supplied interesting historical references.—Mr. William Kelly, Architect, afterwards contributed a paper on "Seventeenth and Eighteenth Century Leadwork in Aberdeen." Mr. Kelly, regretting that plumber work in these days seems unfortunately to be largely excluded from the domain of the Artistic, touched on the earliest examples, and the Literature of Decoration in leadwork. Coming, then, to the subject proper of his paper, he selected for special treatment the lead eaves cornice outside Collison's Aisle, in St. Nicholas Church. By means chiefly of casts and drawings he showed the beautiful character of the work, which he examined in much detail from both an Historical and Artistic point of view. In the same way he discussed the small spire of King's College Chapel, and the leadwork on Bishop Forbes' grave. He found many reasons for ascribing these works to the same master mind, and the date he put down as about 1635. But probably the most striking feature of Mr. Kelly's paper was the concluding part, in which he described and showed drawings of upwards of a dozen spout "water-heads" of ancient date and very remarkable Artistic design, which he had seen on houses in various parts of the city.

## Correspondence.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Having been a reader of the *Builders' Journal* from the first number, and having scanned its pages eagerly week by week, I have participated in some of the pleasure that you have had in the periodical enlargement and improvement of the journal. To me, the *Builders' Journal* is a marvel. Still I have often thought of and wished for a Students' Column—not too deep, but one helpful to average learners. If it be possible to add this feature I think many of your readers would hail the weekly advent of the *Builders' Journal* with even more pleasure.

Yours faithfully,  
BUILDER'S CLERK.

Farnham, Feb. 27th, 1897.

## Announcements.

### Editorial.

THE EDITOR will be glad to read any suitable matter submitted to him, and will return all MSS. when stamps are sent to pay postage.

All matter must reach the Editor by the first post on Monday morning to ensure its treatment in the current issue.

### Publishing.

The terms for free post Subscription to any part of the United Kingdom are SIX SHILLINGS AND SIXPENCE per annum by half-yearly or annual prepayment.

### Advertising.

SITUATIONS WANTED, SITUATIONS VACANT, PARTNERSHIPS, APPRENTICESHIPS.  
Per line, Sixpence. Minimum charge, eighteenpence.

Three Insertions for the price of Two.  
Prepayments in the above advertisements is absolutely necessary.

Page or Paragraph Announcements, Trade Advertisements.

Prices on application.  
Small Advertisements for current week's issue are received up to first post Monday morning inclusive.

Editorial and Publishing Offices:  
Effingham House, Arundel St.,  
Strand, W.C.

THE tablet in memory of Field Marshal Sir Patrick Grant is already being executed, and it has been decided to place it in the crypt of St. Paul's.

## Trade and Craft.

### PLYMOUTH BUILDERS AND THE BYE-LAWS.

Before Messrs. A. S. Clark and J. P. Paige, at Plymouth Petty Sessions, Anthony Robert Lethbridge, builder, was summoned for laying out a lane at the rear of Britannia Terrace, Prince Rock, of insufficient width, contrary to the bye-laws with respect to new streets and buildings. Mr. J. H. Ellis, Town Clerk, prosecuted, and Mr. W. Adams (Adams and Croft) defended.—Evidence showing the Council minutes on the matter and the serving of notice on Mr. Lethbridge having been given, Mr. James Paton, borough engineer and surveyor, deposed to a visit to Britannia Terrace, and to finding the lane as described.—Mr. Ellis objected to questions as to whether the Council had ever previously broken bye-laws with respect to properties sold, and on the magistrates upholding the view that other streets and lanes had nothing to do with the present case, Mr. Adams remarked "Then the Council can do things that other people cannot."—Mr. Adams argued that the provisions of the law were for public thoroughfares, and not private passages, under which category the lane in question came.—The magistrates imposed a fine of 1s. and costs, and gave leave to quote a case.

### PLASTERERS' STRIKE IN DOUGLAS.

The strike of plasterers in Douglas is attracting a great deal of public attention. The dispute has now entered on the eleventh week, and the inconvenience and loss likely to arise to town interests are manifestly very great. While the dispute continues, many contracts are standing still, and cannot be proceeded with.

### THE RIGHTS OF PROPERTY OWNERS.

The case of Chastey and Another v. Ackland, which came before the House of Lords last week, was an appeal from a decision of the Court of Appeal reversing an order of Mr. Justice Cave, made at the Exeter Assizes after trial before the learned Judge without a jury, and it raised the question whether the owner of premises is entitled to protection, not only in respect of his ancient lights, but also of a free circulation of air over and through such premises. The appellants were the owners and occupiers of freehold premises in Exeter, and carried on business therein as lodging-house keepers, and the respondent was the owner and occupier of adjoining premises in which he carried on the business of a dentist. The appellants brought the present action against the respondent for a mandatory injunction and for damages in respect of the alleged obstruction of the appellants' ancient lights and of the free access of air to their premises, by reason of certain alterations which the respondent had made in his premises. At the trial it was proved that there had been an interference with the appellants' ancient lights, the damage in respect of which was assessed at £10; that the effect of the respondent's new building was to make the basement of the appellants' premises damper and their rooms less wholesome, to cause smells in their house, and by checking the draught of the fires to make the chimneys smoke, and to seriously and prejudicially affect the ventilation of their house and so to cause them pecuniary damage. The Judge thereupon gave judgment for the appellants and granted an injunction, ordering the respondent to pull down a portion of the new building he had erected, being of opinion that such new building constituted a nuisance to the appellants' premises by interfering with the ventilation which they had previously enjoyed, by making the basement damp, and the rooms stuffy and uncomfortable to live in. The respondent having applied to the Court of Appeal that the judgment should be entered in his favour as far as the order for the pulling down of the new building was concerned, the decision of Mr. Justice Cave was reversed on the ground that although the want of ventilation and the absence of the means of

carrying off the bad smells on the appellants' premises had probably been aggravated by the respondent's new building, yet that nothing deleterious, nothing hurtful, and nothing disagreeable had been brought upon the appellants' premises by anything that the respondent had done. Their Lordships also held that if a nuisance existed on the appellants' premises it was not created by the respondent, and that the appellants had no legal right to a free passage of air which would remove disagreeable smells created upon their own premises. They further held that if the appellants had been inconvenienced by anything the respondent had done, it afforded no legal ground of complaint. The appellants now sought to have the decision of the Court of Appeal reversed and that of Mr. Justice Cave restored. Eventually it was agreed between the parties that the appeal should be withdrawn on the terms that the £10 damages awarded to the appellants on their claim for the obstruction of their ancient lights should be increased to £300, and that the respondent should pay the appellants' costs in that House and in the Court below, and that even if it were decided that they had a legal right to require the respondent's new building to be pulled down in respect of the loss of the free circulation of air, they should not enforce such right.

### AMERICAN IRON AND STEEL SUPPLIES.

Remarkable statements are in circulation concerning the American iron and steel supplies sent to this country. The Carnegie Steel Company, it is announced, have met with unexpected success, and intend to press the sale of the American material. Supplies are mainly arriving for the Midlands via Bristol, but for the Lancashire and Yorkshire markets via Liverpool, Manchester, or Ellesmere Port. The price for billets or tin bars, delivered c.i.f., is £4 to £4 2s. 6d., to which has to be added 8s. 6d. English freight into the Midlands.

### GRASS PAVING-BLOCKS.

Paving-blocks of meadow grass are now being made in Atlantic City. The inventor is the Rev. J. H. Amies. The meadow grass, after being impregnated with oil, tar, and resin, is pressed into blocks measuring 14in. by 21in. by 3in., and then bound with iron straps. These blocks are said to weigh 40lb. per cubic foot, and can be made denser if desired. The claim is made that the street pavement composed of these blocks is noiseless and elastic, resists wear well, and is impervious to heat and cold. Its manufacturers guarantee its life for five years. A plant was erected in Norfolk, Va., about three years ago, and experiments were made with the pavement in Norfolk and Richmond; the results are claimed to be very successful. The grass used is the ordinary wiry salt meadow grass, common along the Atlantic coast.

### SCARBOROUGH IMPROVEMENTS.

There is a prospect of great activity for the building and kindred trades at Scarborough during the next few years. The Corporation is committed to projects some of which are in actual progress, and others will be started within the present year, which involve an expenditure—taken at original estimates, which are invariably exceeded—of nearly £130,000. These include the Marine Drive round the Castle Cliff, and the southern approaches thereto, £100,000; Wykeham Street Bridge, £4150; Filey Road improvement, £4000; Isolation Hospital, £7500; Recreation Hall, North Cliff, £4500; Harcourt Place improvement, £13,360; crossings, stone-yard, offices, shelters, &c., £620; Falsgrave Park, probably £3000; besides a new street from Durham Place, Granby House Gardens, new mains, &c., not yet estimated. The building undertakings not connected with the Corporation include the Higher Grade School, £20,000; a new company has been formed for the purpose of establishing a new Wesleyan College with a capital of £10,500; the Gas Company is spending £15,000 in new works; a new parish is being formed, and a Church proposed for it, with a probable expenditure of £10,000.

the Guardians are erecting a new Infirmary, at a cost of £7700; and St. Martin's Church people are immediately commencing a new Grammar School, at a cost of £3000. In addition to all these, the owners of the Alexandra Park Estate are constructing roads over a great many acres for its development; Messrs. Walsley, of Leeds, have purchased from Mr. J. W. Woodall his Barrow Field estate, &c., comprising fifty-seven acres, for £30,000, which will be laid out at once for first-class villas; the Young Men's Christian Association and the Fisherman's Institute are each enlarging their establishments; the Harbour Commissioners are contemplating enlarging the harbour, and the Government are about to build dwellings for the Coastguard.

#### MESSRS. YOUNG AND MARTEN.

The employés of Messrs. Young and Marten, of Stratford-le-Bow, had their annual dinner at the Holborn Restaurant, on Saturday, the 20th ult. An air of geniality pervaded the whole proceedings, and revealed the amicable relations existing between the proprietors and the entire staff. Mr. H. H. Marten (proprietor), Mr. Montague Edwards (general manager), Mr. Frank Marten, and Mr. Ernest Marten were the guests of the evening, and during the after proceedings Mr. H. H. Marten was pre-

sented with a handsome piece of silver by the heads of departments and representatives "as a souvenir of the 25th anniversary of Young and Marten," whilst Mr. Edwards, the manager, was the recipient of a silver salver. The toast of "The Firm" was submitted by Mr. Edwards, and acknowledged by Mr. H. H. Marten (who occupied the chair), and who cordially recognised the hearty co-operation of the staff in attaining the success which had been achieved. He hoped 1897 would be a record year. Mr. Marten subsequently proposed "The General Manager and Staff" in eulogistic terms, Mr. Edwards responding.

#### KEYSTONES.

THE Paddington Vestry has selected the famous "Jarrahdale Jarrah" as the Australian hardwood to be supplied for their contract of 650,000 blocks.

A CATHEDRAL on the top of the Rocky Mountains sounds like a romance, and yet it is a fact. For in the little town of Laramie (Wyoming), 7500ft. above the sea—the seecity of Bishop Talbot—there was recently dedicated a Church not unworthy to be compared with those in England, though, of course, on a much smaller scale.

A NEW Baptist Church and schools, erected at a cost of over £3000 in Nelson Street, Lancaster, were recently opened. The old chapel, in White Cross Street, was sold after the schoolroom had been destroyed by fire, to a manufacturing firm whose premises adjoin. The new Church accommodates about 500 persons, and is a stone structure, built on modern principles, and fitted with electric light.

THE project of cutting a canal across the main island of Japan, linking the Japan Sea with the Bay of Osaka, seems likely to be realised. Mr. Sakurada Takesaku, its originator, has prepared the plans and estimated the cost. The canal will be divided into two sections, from Tsuruga to Otsu on Lake Binsu on the one hand, and from Otsu to Rokujigomura on the other. The length of the first section is about 13½ miles and of the second about 9 miles.

THE Glasgow Dean of Guild Court has granted authority for the erection of a large number of new buildings within the city. The General Life Assurance Company, London, received the necessary permission to erect a five-storey building for offices on ground at 141, West George Street. The building of properties by insurance companies has been a feature in the speculative boom which has now continued in Glasgow for over a couple of years.

## CONTRACTS OPEN.

BOROUGH of BURTON-UPON-TRENT.  
SEWAGE FARM WORKS.

The Corporation of Burton-upon-Trent invite TENDERS from competent persons for a CONTRACT for EXCAVATING the GROUND, and CARTING, LAYING, and JOINTING the 27in. 21in. and 18in. CAST-IRON PIPES for the PUMPING MAINS, and the 15in. 12in. and 9in. EARTHENWARE or STONWARE DISTRIBUTION MAINS, and for the CONSTRUCTION of the various BRICK and CONCRETE DISTRIBUTION CHAMBERS, and OTHER WORKS connected therewith, for the DISTRIBUTION of SEWAGE upon a portion of their Sewage Farm in Egginton, Burnaston, and Etwal, in the County of Derby.

The stipulations and conditions of Contract, and specification, with the description of the Works, and the conditions to be observed in Tendering, may be seen, and bills of quantities and form of Tender obtained, at the office of Mr. J. E. SWINDLEHURST, C.E., Borough Engineer, Burton-upon-Trent, on the deposit of cheque or postal order for One Pound, which will be returned after the receipt of a bona-fide Tender, with the bill of quantities fully priced out, and schedule of prices duly filled up. At the same place drawings may be seen, and any further information may be given.

Sealed Tenders are to be delivered at my office at or before TEN a.m. on WEDNESDAY, the 17th MARCH next, endorsed "Tender for Sewage Farm Works," Contract No. 6.

The Corporation do not bind themselves to accept the lowest or any Tender, nor will they pay any expense or charge relating to the making or delivery of the same.

No tender will be accepted from any party who pays his or their employees, whether artisans or labourers, less than the standard rate of wages paid in this Borough, or who does not conform to the hours and conditions of labour generally recognised in each branch of industry affected, and clauses to ensure compliance with this regulation are inserted in the Conditions of Contract.

Burton-upon-Trent,  
Feb. 23rd, 1897.

T. N. WHITEHEAD,  
Town Clerk.

THE VESTRY of the PARISH of  
ROTHERHITHE.

The Vestry of the Parish of Rotherhithe will meet on TUESDAY, March 9th, 1897, at HALF-PAST SIX o'clock in the Evening precisely, at the Board Room of the Workhouse, in the Lower-road, to receive and open TENDERS for the SUPPLY and EXECUTION from

the 26th MARCH, 1897, to the 25th MARCH, 1898, of the following ARTICLES, WORKS, &c., viz.:

1. Broken Guernsey Granite, Pitching Setts, and Kerb.
2. Ballast, Sand, and Hoggins.
3. Lime and Cement.
4. Stoneware Drain Pipes, &c.
5. Scavenger's Broom Heads and Handles.
6. Printing and Stationery.
7. Disinfectants and Sulphur Candles.

Specification and forms of Tender (which only will be received) may be obtained upon application to me, the undersigned, at the Vestry Offices, Public Baths, Lower-road, Rotherhithe, any day up to and inclusive of SATURDAY, March 6th, 1897, between the hours of TEN a.m. and FIVE p.m., except on SATURDAY, when the Offices close at TWO p.m.

The Tenders in respect to Printing and Stationery should contain the names and addresses of two responsible persons as sureties.

Tenders, enclosed in sealed envelopes, and endorsed "Broken Guernsey Granite," &c., or as the case may require, to be delivered at the Vestry Offices aforesaid, on or before MONDAY, the 8th day of MARCH, 1897, after which no Tenders will be received.

The party or parties whose Tenders may be accepted will have to sign an undertaking to pay his or their employees the Trades Union rate of wages.

The Vestry do not bind themselves to accept the lowest or any Tender.

By Order,  
JAMES J. STOKES,  
Clerk to the Vestry.

Vestry Offices, Public Baths,  
Lower-road, Rotherhithe, S.E.  
Feb. 18th, 1897.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

ABERDEEN (N.B.).—Accepted for the execution of road works, for the Town Council. Mr. Wm. Dyack, Burgh Surveyor, Town House, Aberdeen:

CONTRACTS OPEN.

**GREAT EASTERN RAILWAY COMPANY.**  
NEW STATION AT FELIXSTOWE.  
NOTICE TO BUILDERS AND CONTRACTORS.  
The Directors of this Company are prepared to receive TENDERS for the ERECTION of a NEW STATION at Felixstowe.

Persons desirous of tendering can, on application to the Engineer, obtain copies of the specifications and quantities, and the drawings can be inspected at his office, at the Liverpool-street Station, on and after Monday, the 1st day of March, 1897.  
Sealed tenders, in envelope, endorsed "Tender for New Station at Felixstowe," should be addressed to the undersigned, and must be delivered at the Secretary's Office, Liverpool-street Station, not later than Ten a.m. on FRIDAY, March 12th, 1897.  
Tenders to be sent through the General Post Office; any sent otherwise will not be considered.  
The sum of £10 10s. will be charged to each applicant for the specifications, quantities, and forms of tender; but such sum will be refunded to those whose tender is not accepted, providing the specifications, quantities, forms of tender, and all other documents be returned with the tender.  
The Directors do not bind themselves to accept the lowest or any tender.  
By Order,  
T. D. GENLLOUD, Secretary.  
Liverpool-street Station, E.C., February, 1897.

**BIRMINGHAM CORPORATION**  
WATER.—ELAN SUPPLY.  
CONTRACT NO. 6.—FRANKLEY RESERVOIR, FILTERS, &c.  
TO CONTRACTORS.  
The Corporation of Birmingham are prepared to receive TENDERS from competent persons willing to enter into a contract for the CONSTRUCTION of about

1½ miles of RAILWAY, a LINED SERVICE RESERVOIR to hold 200 million gallons, Eighteen FILTER BEDS having a total area of about 67,000 square yards, with the necessary inlet, outlet, washout, and overflow arrangements, and for other WORKS described in the bills of quantities.

The drawings may be seen, and specification and bills of quantities obtained, at the office of the Engineer, Mr. JAMES MANSERGH, 5, Victoria-street, Westminster, on and after NOON of TUESDAY, the 2nd day of MARCH next, on the deposit of a cheque for £20, which will be returned after the receipt of a bona-fide Tender with the bills of quantities fully priced out.

Early application for particulars is necessary, as only a limited number will be given out, and none supplied after the 10th day of MARCH.

The Contractor will be required to undertake not to pay less than the minimum standard rate of wages current in the district in which the works are situate.  
Sealed Tenders, addressed to me, and endorsed "Tender for Frankley Reservoir, &c., Contract No. 6," are to be delivered at my office (post paid), at or before NOON of WEDNESDAY, the 31st day of MARCH next.

The Corporation do not bind themselves to accept the lowest or any Tender.  
EDWARD ORFORD SMITH,  
Town Clerk's Office, Birmingham,  
February 22nd, 1897.

**CITY OF SHEFFIELD.**  
BRIGHTSIDE PUBLIC BATHS.  
The Health Committee invite TENDERS for the CONSTRUCTION and ERECTION of PUBLIC BATHS at the corner of Sutherland-road, opposite the end of Earsham-street, Sheffield.  
Plans and specification may be seen and quantities obtained at the Office of Mr. Charles F. Wike, M. Inst. C.E., City Surveyor, Town Hall, Sheffield, on payment of One Guinea, which will be returned on receipt of a bona-fide tender.

Tenders, endorsed "Public Baths, Brightside," to be sent in not later than Six o'clock p.m. on WEDNESDAY, March 3rd, 1897, addressed "Chairman and Members of the Health Committee, City Surveyor's Office, Town Hall, Sheffield."

The Committee do not bind themselves to accept the lowest or any tender.  
The contract will comprise the fair wages and conditions of labour clause which has been adopted by the Sheffield Corporation, particulars of which will appear in the specification.

By order,  
HERBERT BRAMLEY, Town Clerk.  
Town Clerk's Office, Town Hall,  
Feb. 19th, 1897.

**KINGSTON UNION.**  
TO BUILDERS AND CONTRACTORS.  
The Board of Guardians of the Kingston Union invite TENDERS for BUILDING a new MALE INFIRMARY, NURSES' HOME, and PORTER'S LODGE, at the Workhouse, Kingston-on-Thames.

The drawings and specifications can be seen, and bills of quantities and form of tender obtained on application to Mr. William H. Hope, C.E., Architect and Surveyor, Union Offices, Portsmouth-road, Kingston-on-Thames.  
A charge of £2 2s. will be made for a copy of the quantities, which have been taken out by Mr. Guy M. Nicholson, of 2, Old Queen-street, Westminster, and this charge will be returned on receipt of a bona-fide tender.

The contractor shall pay the fair rate of wages current in the district, and for this purpose the definition of a fair rate of wages shall mean trade union rate.  
The time for sending in the tenders, and all further information, may be obtained on application to the Architect.

The Board do not bind themselves to accept the lowest or any tender.

JAS. EDGELL, Solicitor,  
Clerk to the Guardians.  
Union Offices, Portsmouth-road,  
Kingston-on-Thames, February 17th, 1897.

## WORKHOUSE PLANNING.

BY GEORGE H. BIBBY, F.R.I.B.A.

(Continued from page vii.)

### No. II.—ENTRANCE AND RECEPTION BUILDINGS.

IT is usually desirable that there should be only one general entrance to a workhouse, both for officials and paupers, and that such entrance be so arranged that the porter shall have complete and immediate supervision with regard to all admissions to the institution. It should be remembered that the position of porter to a workhouse is not without some elements of danger, not merely by reason of violent, drunken, or insane applicants for food and shelter, but also because large numbers of paupers, seeking the shelter of a workhouse, are found to be suffering from dangerous, infectious, or loathsome diseases.

In planning the entrance buildings these contingencies must necessarily greatly affect the arrangements to be made, and the work-

house Architect must arrange his plan with the knowledge that as soon as a pauper is admitted he must be placed in a special apartment for his reception, where he shall at once be examined by the Medical Officer. If this official, upon such examination, shall discover that the pauper be suffering under any disease of body, or be defective in intellect, the pauper would then be placed in the wards for sick or infirm, or in such other portion of the buildings as might appear advisable by the Medical Officer, as, for instance, the wards for the imbeciles or harmless lunatics, for able-bodied paupers, or for vagrants, &c.

The plan of the entrance and receiving buildings must be influenced, further, by the circumstance that no pauper should be detained in a reception-ward for a longer time than is absolutely necessary for carrying into effect the medical officer's duties above-named, or for making such inquiries respecting the pauper as may be desirable, except from some exceptional or unavoidable cause, such as the overcrowding of the ward to which he should under ordinary circumstances be sent.

All plans for receiving-wards should be so arranged that the paupers, before being removed therefrom shall have every convenience

for being thoroughly cleansed, and for being clothed in a workhouse dress; there must also be facilities for the disinfection and purifying of the pauper's own clothing, after which the latter must be deposited in an apartment planned for the purpose, and from whence the same would be returned to the pauper upon leaving the workhouse.

The entrance buildings for a workhouse must therefore be planned in accordance with the above requirements, there must be apartments for the porter and portress, also receiving-rooms or probation-wards, with rooms for storing pauper's own clothing, and it may be in special cases arranged to accommodate the vagrants, and include the board-room, clerk's office, strong-room, and a room for the public vaccinator, but the size of the workhouse would usually influence, very considerably, the extent of the provision to be made at this point, and decide whether or not some of the apartments might be advantageously placed elsewhere.

The reasons for not always placing the vagrants' wards in the entrance building depend, in a measure, upon the proportion of this class to be expected to seek admission; where the number of vagrants is considerable

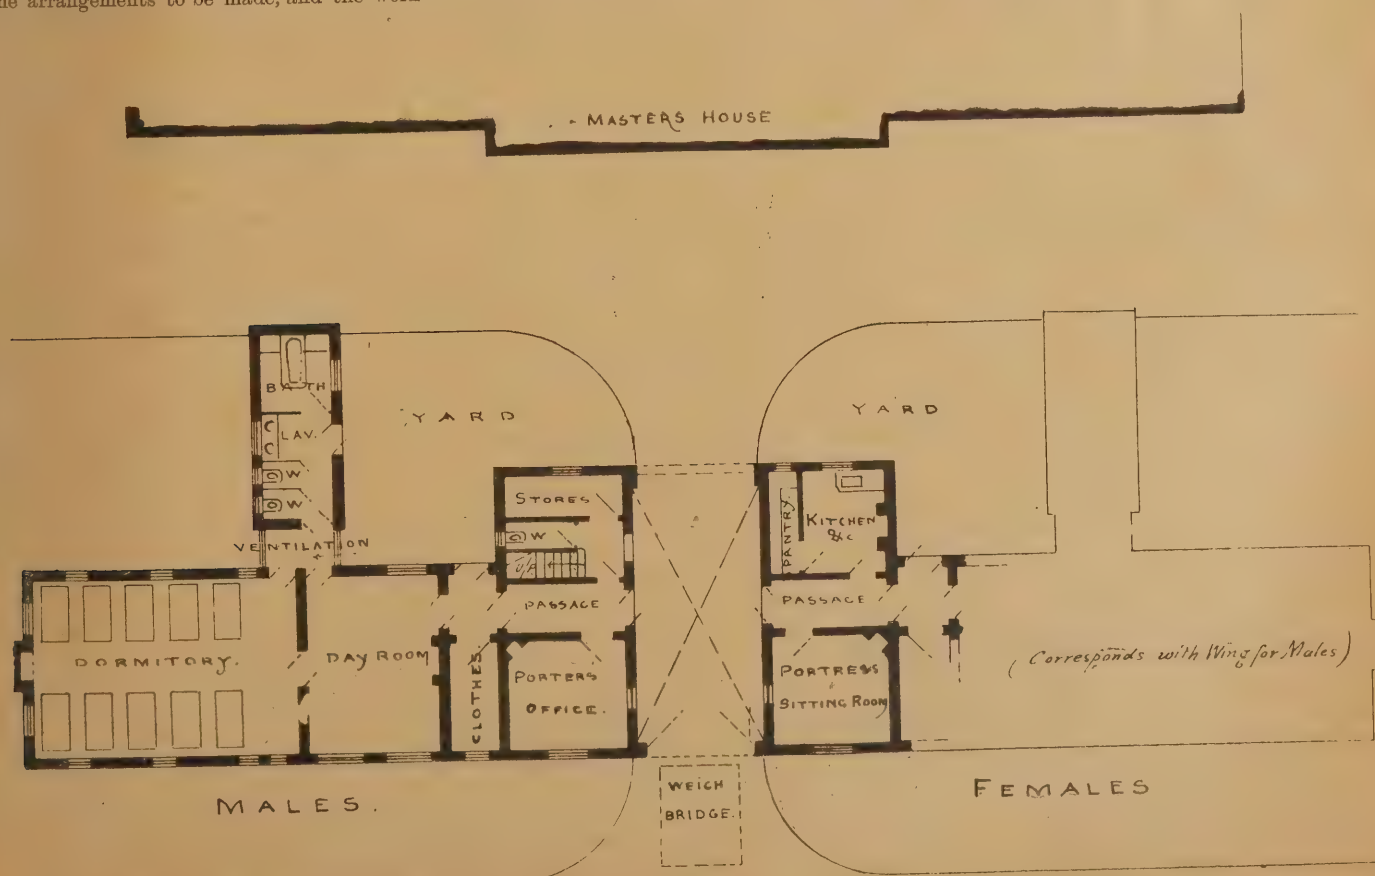

Fig. 1.

Fig. 2.

special arrangements must be made. These would involve separate buildings, and will be dealt with in a later article.

At or near to the workhouse entrance there should be fixed a weighbridge. It has been officially stated that the use of such an apparatus will frequently be found to save its first cost within a year. Messrs. Pooley and Son, of Liverpool and London, manufacture a patent weighbridge, which has been adopted at a large number of workhouses, asylums, and buildings of a similar character.

If it be convenient that the rooms for the public vaccinator be in any way attached to a workhouse, or to the offices for the Guardians, it is necessary that there be provided a distinct entrance, so that persons who are not paupers may avail themselves of the services of the vaccinating officer without entering in any part of the building intended for the relief of paupers and vagrants. The vaccination offices should include a room of small size for the medical officer on duty, and should be wholly separated from the union buildings. There must be a waiting-room of a size adequate to the numbers likely to seek vaccination in the district, and it would be a decided advantage if the vaccination entrance could be placed in a different road to that in which the workhouse general entrance is placed.

In populous districts many children may, under various circumstances, be committed temporarily or otherwise to the workhouse by the police magistrates. It is, therefore, frequently requisite that special provision for their detention should be made, as the workhouse authorities are responsible for their safe custody. For obvious reasons it is most undesirable that such children should be permitted to associate with any of the inmates of the workhouse while under remand. Therefore sufficient dormitory and day accommodation, with lavatories, baths, and closets, &c., should be provided, except in the case of those country or other small workhouses where few of such remanded children would be expected. But in connection with many country (and some town) workhouses it is desirable that there should be provided carriage-sheds and stables, so that the conveyances and horses belonging to the Guardians may be put up while the business of the Union is being transacted. Such accommodation as this should most certainly be contrived near to the workhouse entrance, and is the due of those Guardians who give up much of their time to public duties, and have to travel considerable distances to do so; but such stable accommodation need not be of a costly description.

In a yard, conveniently near to the entrance to the workhouse, accommodation may sometimes be arranged for persons to work in respect of their out-door relief. It is considered that this should usually be distinct from the workhouse buildings, although within the precincts of the same, the enclosure should be provided with sheds for stone-breaking, and apartments for the storage of implements and tools, also a small room for the labour-master.

N° 3

The shed for stone-breaking requires to be divided into spaces (each about 4ft. 6in. in width and 5ft. 6in. in depth). The divisions must be of substantial construction, and may be about 4ft. 6in. to 5ft. in height. There should be suitable entrances and exits for the

carts bringing the unbroken and taking away the broken stones.

In times of depression of trade, and during strikes, &c., large numbers of persons appear before Boards of Guardians and committees as applicants for special relief. For the accommodation of such as these it is necessary to provide a suitable waiting-room. The area of this must be sufficient for at least the average number of persons likely to require assistance in the district. If it must be a large room, probably it should be heated by hot-water pipes in the winter, and if of small or moderate dimensions possibly ordinary fireplaces would be sufficient, but to leave such a room without proper and sufficient means of heating would be a serious omission, especially as times of depression and increases of pauperism too frequently occur during the winter period.

If there should be more than one relieving officer, separate offices should be provided for each, with due provision for heating. These offices should be in direct communication with the general waiting-room for applicants. The waiting-room should be so arranged that the applicants may enter at one door, and, after interviewing the Guardians, committee, or relieving officers, pass out of their offices without again coming into contact with the later applicants remaining in the waiting-room or re-entering that apartment. The waiting-room should be provided with an annex for closets for both sexes, or otherwise, with closet accommodation in yards near to or adjoining the waiting-room. The general arrangement of the waiting-room must be such as to render it easy for the officials to pass the applicants for relief in rotation through the building in an orderly and expeditious manner. It need hardly be said that frequently the condition of the applicants for relief is such that thoroughly good ventilation is absolutely necessary in every part of the buildings through which they may be compelled to pass. This ventilation should be both by windows and ventilators.

In connection with the relieving officers'

rooms there should be storerooms, properly fitted up with shelvings, lockers, and receptacles for all that has to be dispensed in relief. Four hundred cubic feet of space must be provided for each occupant of the receiving wards, which should not be less than 10ft. in

height, or have a less area than 40ft. to each bed. The rules of the Local Government Board also require that these wards should be provided with the requisite independent water-closet, bath, and lavatory accommodation, and be capable of being warmed in winter. The means of communication between the receiving wards and the bathrooms should be such that it shall not be necessary to pass through the open air to reach them, and the occupants of the receiving wards should be able, by means of bells or otherwise, to communicate readily with the porter or other appointed official.

The requirements of the Local Government Board with regard to the superficial area to be provided for each inmate of a receiving-ward cannot be said to err on the side of undue extravagance, considering the serious doubts often experienced as to the condition of new inmates, 40ft. of floor space would appear to be somewhat insufficient; in Fig. 1 will be found a scheme for an entrance-block of workhouse buildings of a simple description and without the adjuncts of stables for the Guardians or any of the other buildings and yards for vagrants and others for whom accommodation would be found in special buildings to be described in a later paper, the central portion of the plan shown in Fig 1 would be two storeys in height, while the two wings for males and females would be merely one-storey erections, the upper floor of the central block would form suitable bedroom accommodation for the porter and portress, who would be a married couple in charge of the reception-wards and of the general entrance, which would be provided with a weighbridge connected with the porter's office; the baths are so arranged that the inmates need not pass through the outer air from the wards in reaching them, and the w.c.'s and lavatories are so placed that they may be used from the yard, dormitories, or day-rooms.

The position of the entrance and receiving-wards must frequently be much influenced by the surroundings of the site of the workhouse. As an instance of a thoroughly undesirable plan and locality, I give a plan of a workhouse as it existed about the year 1870. This is shown in Fig. 2, which indicates (in hatched lines) the position of a workhouse, closed in by narrow streets and alleys, all of which are closely built up. Considerable accommodation was provided in this institution for the infirm and for children, and it will be well understood from the plan that it was most unsuitably placed for such purposes. The reference to the plan is: A Males' Infirmary, B Females' Infirmary, C Nursery, D Women's Hall, E Boardroom, F and G Entrances, and H Chapel. This was the workhouse for St. James', Westminster, and a more undesirable situation for such an institution, or worse approaches thereto, could scarcely be imagined, especially as the neighbourhood is so greatly populated. It will be seen from this plan that the only frontages to the street are the two narrow entrances at F and G, the remainder being inclosed with buildings on every side.

Another example of the same date (or thereabouts) is shown on Fig. 3, where the plan is very much more open. This is the St. Pancras Workhouse, when it included some features not usually found even then in connection with institutions of the kind, as will be seen from this reference:

A Infirmary	O Male casuals
B Kitchen	P Imbeciles & lunatics
C Nursery	Q Stores
D Oakum-room	R Male wards
E Female wards	S Coach-house
F Chapel	T Stable
G Master's room	U Receiving (females)
H Matron's room	V Ditto (males)
J Laundry	W Library
K Kitchen	X Vestry hall
L Workshops	Y Coach-house
M Casuals' yard	Z Entrances
N Female casuals	

From this arrangement it will be seen that the receiving wards at U and V, although not directly in connection with the entrance at Z, were yet placed between that entrance and the main buildings.

The buildings to be provided for children immediately upon their admission to a workhouse or workhouse school should be in the form of quarantine, or probation-wards, and be of sufficient size to accommodate children for, say a fortnight, previous to their mixing with the other children in the institution. Such wards should be provided with day-rooms.

Some of the erections formed at or near to the entrance and reception buildings will be more conveniently dealt with in a separate paper, and these I purpose to describe, under the heading of Vagrant's Wards, in my next article.

(To be continued.)

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.\*

BY ALEXANDER DREW.

(Continued from page xii.)

### No. II. OF SERIES.

THE several forces which act on the truss are generally called the *external forces*, the forces which the several members exert to resist these are termed the *internal forces*.

Before actually starting to the drawing of such a diagram, some ready means of reference to the several members and loadings is necessary, and by far the handiest is that first proposed by Mr. Robert H. Bow, and generally named after him. By this method of lettering or marking, each space enclosed either by members or by forces is given a distinguished letter or sign, and any member of force is then readily designated by means of the signs on either side of it; thus, the end main-tie would be known as A1 in the marking shown on Fig 16, the upper portion of the left-hand rafter would be G2, and the inclined, or Queen tie, as it is sometimes called, would be 2 3 or 3 4, &c. The external forces can be named in exactly the same manner.

The operations to be gone through in drawing any stress diagram may be briefly noted. First, the *polygon of external forces* must be drawn. (It may be well to note here that where all the external forces act parallel to one another, this polygon will take the form of a straight line.) Second, taking the several points of the truss in succession, lines are drawn parallel to the members or forces which meet at that point; the corresponding letters or signs which are placed on each side of these members or forces being now placed at the extremities of the corresponding parallel lines; thus, in the skeleton diagram each space has a sign allotted to it, while in the stress diagram the signs are placed at the extremities of the lines, not on each side. In drawing these several lines above alluded to, a regular system must be followed, and that is to begin at some space on the skeleton diagram and work in a uniform direction round the joint under consideration, drawing the corresponding line on the stress diagram as each force or member is passed over in this regular movement round the joint. The special point to be noted is that the space chosen to begin at, and the direction of moving

round the joint, should be such that the first forces met with are those which are fully known, the last to be drawn being those of which we know only their direction. As previously emphasized with reference to Figs. 10 and 11, the direction in which the last lines on the stress diagram are drawn, also indicates the direction of action of the corresponding members at the point under consideration; by noting this, the several arrow-points may be at once placed on those members, and thus the nature of the stress may be determined. Taking this Fig. 16 in detail, to draw the polygon of external forces, a point A is chosen, then beginning at the space A on the skeleton diagram, and working round by the spaces X, E, G, I, J, and Y, the starting space A is eventually reached; and, while this movement is being gone through, the first force passed over, that of A X, is indicated by an upward-drawn line from the point A to X, of a length proportionate to the force of 56cwt. The next force X E acts downwards, and is of a value equal to 14cwt., it is drawn on the stress diagram from X to E; the next force E G of 28cwt. has its counterpart in the length of line E G on the stress diagram, and so in succession, G I, I J, J Y, all acting downwards, brings the stress line to the point Y, the last force passed over before reaching A, that of Y A, an upward force of 56cwt. finishes this operation at exactly the starting-point A.

Having thus completed the polygon of external forces, the next operation consists in graphically determining the stresses at

the several joints; and, beginning with the left-hand junction of rafter and tie, the known forces consist of the upward force A X and the downward force X E, the unknown forces being those due to the resistance offered by the rafter E I and the end tie A I; in this case the starting space on the skeleton diagram is A, and by moving round in the same direction as previously done when drawing the polygon of external forces, the two known forces are first met with. Thus beginning at the point A on the polygon of external forces, the line representing the first-known force A X is already drawn, the next known force X E is also already set out; and to complete the force polygon for this joint, it is necessary to get from the point E to A on the stress diagram by means of two lines, the one parallel with member E I and the other with A I on the skeleton diagram; thus from E on

\* A lecture delivered before the members of the Edinburgh Architectural Association, and exclusively published in the Builders' Journal.—Ed.

the stress diagram a line E 1 is drawn of any length, and from A the line A 1 is drawn till it intersects this last line at the point 1. It will be noted that in drawing this polygon the several lines were drawn from A upwards to X, X to E, then from E to 1 in a downward direction, and from 1 to A in an upward direction; these two latter directions indicate the direction of action of the two respective members, so that the two arrow-points shown near this joint can be now marked on. Knowing the value of the force and the direction of action at one end of any member, we also know that it exerts an equal but opposite action at the other extremity, so that the second arrow

out from A downwards to the point 1, from 1 to 2 (both these being in the directions indicated by the arrow-points); returning to A by means of the lines 2 3 upwards, and 3 A towards the left, these directions enable us to mark on the arrow-point correctly. Thus half of the complete diagram has been drawn, and as the loadings are symmetrical, the second half should be similar to this portion. It is well, however, to complete the diagram, moving onwards in regular succession from the joint at the apex of the rafters to that at the centre of the right-hand rafter, thence to joint at lower end of strut 4 5, and finally to that of the right-hand shoe. The last line to be

drawn at this point will form a perfect check as to the previous correctness or otherwise of the diagram; should this last line close in neatly, the complete diagram may be safely taken as correct, but should this not be the result, either the original forces are not correct or not balanced, or the several lines drawn have not been parallel to the corresponding members on the skeleton diagram, and the work must be gone over again. The diagram shown in Fig. 17 is that for live load or wind stress, and is drawn in identically the same manner as just noted for dead loads; the only differences worth noting are that the reactions at the shoes are now of different values, and on completing the latter half of the stress diagram it will be found that at one point the polygon may be complete without requiring to make use of a line parallel with that of the strut 4 5. When a condition of this kind arises, the inference is that under that particular circumstance this member is not required, and theoretically can be dispensed with.

To readily determine graphically the reactions at the shoes, the simple method shown above the skeleton diagram may be made use of. The line X, E, G, I, is drawn in any convenient position on the paper, the various lengths, X E, E G, and G I, being to scale proportionate, and parallel to the several wind-forces similarly lettered. Any point O is now chosen, and lines drawn from the several points in the line X I to this point. Returning to the skeleton diagram, any point in the line of action of the forces X E is chosen, and from this a line is drawn parallel to the line G O on the polar diagram, till it intersects the line of the force E G; from this point of intersection a second line is drawn parallel to the line E O till it intersects the line of the force G I; and from this second point of intersection a line is drawn parallel to X O, and the point where it intersects the line of action of the force Y A is joined by means of a straight line with the starting-point. If a line parallel to this last line be drawn from the point O, its intersection with the line X I will divide this line in the proportion of the two reactions at the shoes; it is only necessary then to measure these two portions to get at the desired values. This being determined, no difficulty need be experienced in drawing the diagram here shown, exactly the same principle being adopted as with the previous diagram.

At the second of the course of lectures for sanitary officers, held at the Sanitary Institute on Friday, Mr. Herbert Manley, Medical Officer of Health for West Bromwich, lectured on English, Scotch, and Irish Sanitary Law and the Public Health Act of 1875.

## Surveying and Sanitary Notes.

THE Ayr Town Council has accepted the estimate of Mr. Hugh Hastie, Crieff, amounting to £4258, for contract No. 3 of the new drainage scheme.

MR. W. BOWMAN DAVIES, Associate Sanitary Institute, and assistant sanitary inspector for the Borough of Neath, has been elected a fellow of the Institute of Sanitary Engineers.

At the Lincoln Town Council meeting the Highways Committee reported that it had decided to use hard instead of soft wood for the proposed paving of the High Street, and that the estimate for the wood paving would now be £3614. The Sanitary Committee was directed to report as to the best means of carrying into effect the provisions of Part 3 of the Housing of the Working Classes Act.

FOUR applications were submitted to the Aberdeen Town Council for the vacant office of cleansing inspector. The candidates were: Alexander Findlay, inspector, Aberdeen City police; George Y. Lumsden, St. Andrews; Hamilton M'Adam, Hamilton; Andrew Millar, Glasgow. Mr. Findlay received the unanimous vote of the Council, and was appointed to the post. The salary is £200 per annum.

THE Town Council of West Hartlepool has approved of the scheme for the extension and improvement of the sea-wall, with handrail approaches to the sands, and promenade of tar pavement; of the purchase of an additional steam-roller, 12 tons, with fittings for the drawing of the scarifier; and an apparatus for the testing of sewer pipes. Owing to the large amount of work in hand, and its probability of increasing, it has been decided to appoint an additional Clerk of Works for new street work. The borough surveyor reported that there were at the present time about 30 street contracts in hand, and that others were about to be advertised.

As directed by the Board, the Paving and General Purposes Committee of the St. Saviour's Board of Works reports that it has considered the feasibility of lighting the streets in the St. Saviour's district by means of electricity. The surveyor has been in communication with the London Electric Supply Corporation, Limited, and the City of London Electric Lighting Company, Limited, and ascertained from them the terms upon which they would be willing to undertake the lighting of the five principal streets in the district. The mains of the former company were available for Borough High-street, Blackfriars-road, and Stamford-street only. Their charge would be about £32 per lamp per annum, the Board providing at its own cost all lamps, pillars, switches, boxes, &c., requisite for the installation. If they lighted Southwark-street and Southwark Bridge-road in addition—i.e., all the five streets named—they calculated that the expense to the Board for the necessary plant of the two last-named streets would be about £5000. This would not include the cost of current to the lamps, nor the lamps, &c., for the other three streets. The City of London Company had furnished a scheme providing for 86 arc lamps, placed about 120ft. apart. The company would require a contract for 21 years. The cost of these 86 lamps would be £2408 per annum, and they would only displace 166 gas lamps. There were in St. Saviour's district 590 lamps altogether, the annual cost of lighting the whole of the district with gas being about £2000. Therefore the cost of lighting the five principal streets by means of electricity would be considerably more than the account incurred in lighting the whole of the district by gas. The committee, having regard to the enormous cost, do not recommend the Board to undertake the lighting of the district by electricity.

points at the other extremes of this rafter and tie may now be drawn on, their direction being, of course, opposite to those of the first. Since the length of these lines E 1 and A 1 indicate the values of the stresses on the corresponding members, nothing further need be done, if no other stresses be required.

But should it be desired to get at the stresses on the other members, the same operation need only be repeated. It should be noted that by this method it is only possible to determine the stresses on two members at one time, so that the next joint to be considered should be chosen such that only two unknown quantities require solution. Thus the next joint would be where the strut 1 2 meets the rafter. By the first operation the stress E 1 has been determined, so that the known forces here are E 1 and E G. The starting space would, in this case, be 1, and moving round this joint in the same direction as previously, the figure sketched out on the stress diagram would be as follows: From 1 upwards, as indicated by the arrow-point on the rafter, to E, down E G, and to get back to the starting-point 1, the lines G 2 and 2 1 are drawn. The finishing directions were down G 2 and up 2 1, thus enabling the correct arrow-points to be marked on the members G 2 and 2 1, and also allowing us to put on the other arrow-points at the opposite extremities. The next point would be at the junction of A 1, 1 2, 2 3, and 3 A, and starting at the point A and moving round in this direction, the stress polygon would be sketched

ALTHOUGH the streets of the Metropolis are every year being improved, our principal thoroughfares showing a marked advance in every respect during the last quarter of a century, yet the same can hardly be said of our statues, which still leave much to be desired, not so much, perhaps, in their execution—though at times this is bad enough, in all conscience—as in their location.

Circus. The Prince Consort thereon is for ever saluting with raised cocked hat the surging crowds of Holborn, and though we have no fault to find with the figure as a figure, it is most decidedly ill-placed, in that it is too small for the surrounding buildings, the size of which tend to still further dwarf the horse and its rider. There is some good work on the pedestal, but the statue would look much better if placed in a park enclosure surrounded by trees and greenery. Again, what can be more distressingly disastrous than the effect produced by the latest of the City statues, that of the Queen, which has been found a home at the eastern end of the Victoria Embankment, at the foot of Blackfriars Bridge. Here the monument is out of all keeping with its surroundings, with the result that it is absolutely dwarfed into utter insignificance, a fact still further accentuated by the tall pillar of the electric light which overtowers it by day and overshadows it by night. On the lawn of a country mansion

bouring refuge post. This is a discoloured, smoke-begrimed group of statuary, which is also very ill-located, but which would look all right if placed in a park, or on a large barrack square or parade ground. To hark back for a moment to the City, we have in front of St. Paul's Cathedral another very ugly statue, that of good Queen Anne, whom we are repeatedly told "is dead," and of whose effigy it has been written that she stands "with her face to the 'pub,' and her back to the Church." This group of pale marble is far too small for the position in which it is placed, and accommodation could very well be found for it inside the Church, if the Museum would not take it. Again, one of the choicest possessions in London, the gift of Sir Erasmus Wilson, viz., Cleopatra's Needle—this could not be set up on the banks of the grimy Thames without being flanked on each side with Brummagem sphinxes, the ancient and the modern being thus blended, though with not very satis-

AN OLD COTTAGE. BY EDITH DAWSON.

During the past twenty-five years many new statues have been set up within our gates, as it were, but from the Artistic standpoint it is not too much to say that the greater number of them have proved failures. Thus, there is the memorial to the second Brunel at the bottom of Surrey Street on the Victoria Embankment, where it keeps watch and ward over a patch of green shrubbery and a ventilator to the District Railway, though it is only just to the figure to record that its back is turned to this latter, as though in disgust at being made the ornamental set-off to a funnel. This statue could hardly have been more inelegantly placed, for while the figure is fairly satisfactory, it is so hedged round with Architectural features as to positively rob it of any elements of beauty or effectiveness. To make this statue at all pleasing the whole of the scroll and stonework would require to be knocked away. Take again the equestrian statue of Albert the Good in the Holborn

this statue would have been properly placed; where it is, it is very improperly situated—a fitting companion to that of the Prince Consort in the neighbouring circus of Holborn. Leaving the riverside for Fleet Street, we find at the western boundary thereof the huge, ugly German-stove, griffin-surmounted effigy that marks the site of old Temple Bar, than which nothing could well be uglier or more unfortunately placed. Save for the panels on the base, it has no artistic beauty whatever, and, though it may not be so great a hindrance to traffic as the old Temple Bar, still it is so ugly and so ill-situated that it should be at once consigned to the Guildhall Museum. A tablet in the wall of Child's Bank opposite would meet all practical requirements. Going still west, we find in Waterloo Place the Guards' Memorial, which has not been inaptly termed the "Quoit Thrower," for here Fame looks for all the world as though she were about to cast the laurel wreath over some neigh-

factory results, to our thinking. Then again, in Whitehall Yard, behind the Banqueting House of Inigo Jones, now used for the purposes of the Royal United Service Institution, stands a really very well executed statue of King James, which (owing to its position in a semi-private yard occupied by Government offices, where its very existence is not suspected by five per cent. of the many thousands of persons who daily pass along Whitehall) is absolutely lost. If the statue is worth preserving at all, it should be removed from its semi-obscurity into a well-chosen and more public position. In several of the metropolitan squares there are many more or less inappropriately placed statues, some looking as though rising from among the greenery like Phoenix from its ashes; others behind spiked railings, as though prisoners in the dock. Leaving the ill-placed for the well-placed statues of the Metropolis, there is no doubt that the best situated

memorials are those which adorn Palace Square, Westminster, some portions of the Victoria Embankment Gardens, the Wellington Memorial at Hyde Park Corner, the Achilles statue in Hyde Park, those on Carlton House Terrace, and the Albert Memorial in Kensington Gardens. And this brings us to remark that although over a quarter of a century has elapsed, the noble bases and plinths on Blackfriars Bridge and along the river wall of the Victoria Embankment are still unoccupied, and nothing, save the provision of some really artistic lamps, has been done to ornament in an artistic manner this noble riverain boulevard (one of the finest in the world), although much has been done on the landside to provide large and expensive buildings. It is to be hoped that an effort will be made, at no very distant date, to fill these bases and plinths with groups of statuary, and a start might very well be made with Queen Boadicea, which has been offered to the nation by Mr. Thornycroft, and would be appropriately located on the banks of Old Father Thames, while groups symbolical of the history of the City and leading events therein might well be utilised for the ornamentation of the eastern boundaries. This is a case of neglect which should be remedied, and it is to be hoped that an early alteration will be made.

#### INDIVIDUALITY IN ART.

By MR. T. G. JACKSON, R.A.

IN distributing the prizes to the students attending the Birmingham Municipal School of Art, Mr. Jackson compared the Art Schools of the present time with those times to which they were accustomed to look for examples in matters Artistic. In those days there were, indeed, Schools of Art based on traditions of great teachers attached to certain places, with the name of which they were inseparably connected, grouped round some one great master, or a succession of masters working on the same principles and following the same methods. But these schools were not academic or corporate bodies, pretending to train students and maintaining professors to teach them. A young aspirant to Art began by binding himself as apprentice to some person who could teach him the mystery of that Art which he was to follow. There were no public or municipal schools ready to receive him, and when they talked of the Art Schools of Umbria, Rome, Florence, Siena, Bologna, Venice, and Milan, they merely meant to distinguish the different styles into which Art fell at these different centres of Artistic life. For Art to be at its best it must be the expression of the individuality of the Artist; it must bear upon it the character or stamp of its author; it must be the outcome of his personal thought and sentiment. In a work of Art they ought to be able to read the mind of the Artist behind it. Not, of course, that his personality should be forced upon their notice by any conscious effort on his part—that only led to mannerism and vulgarity, or, at the best, eccentricity. But just as in the work of the best writers they recognised a way of putting things into words which was the author's own, and a train of sentiment and sympathy natural to himself, all of which constituted a style peculiar to him, and expression of

#### HIS OWN PERSONALITY

in a manner undesignated by himself and unconsciously adopted, so in a painting, a carving, or a building by an Artist, they ought to be able to recognise his own mind on canvas, stone, marble, brickwork, or carpentry. He thought that, though this had been true in the main for all time, it was especially true of the age we lived in. In the earlier phases of Art there was less room for individual expression, and the Artist was to a great extent lost in

the school to which he belonged; but as Art became more natural and less conventional they detected more and more clearly the impress of different great Artists, and of the schools they founded. When, however, they came to the great schools of modern Europe, and the Gothic style which sprang from the ashes of the old dead classical Art, though each period had its own peculiar style, to which each Artist perforce submitted because he knew no other, still each man was free to indulge his own fancy within the limits of that style; and not only that, but whenever any fresh idea possessed him, and he had something novel to say, there was nothing to prevent him breaking away from the current fashion and bursting through the limits of the style he was brought up in, to advance his Art a step further, and bring about a transition from the style then in vogue to a new one hitherto not dreamt of. He indicated the transition of styles in Gothic Architecture, and said they could not trace the successive steps to

#### ONE INDIVIDUAL INFLUENCE.

The progress seemed rather that of a School than of individuals. In our own case, individual effort had a still more important part to play than even in the Middle Ages. There they had individual effort working within a School. But where was our School now? What had we at the present day corresponding to that common acceptance of certain traditions of form, design, and execution to which all Artists of the day conformed, and from which it resulted that all the works of one period were modelled in one style—the style of that period? All that was gone, and, however much they might hope for some recovery of ancient harmony and consistency, it must be admitted that we were far enough from it at present, and that not only in Architecture, but in Painting and Sculpture too. It was to the proper use and direction of individual effort that they must turn their attention in the training of Art students. One great danger of all Art Schools was that there might be too much teaching in them. Nothing could be worse, or more likely to do harm, than to apply one rule to all students, and force them all through one and the same course of study, however they might differ in natural gifts and inclinations. Another danger which attended the teaching in Art Schools arose from the very common mistake that teaching drawing was the same thing as teaching Art. Many a student thought that by learning to draw he was learning to be an Artist, whereas, in fact, he was only learning the use of his tools.

#### THE POWER OF DESIGN

was a natural gift, which could not be implanted if it were absent, but it might be fostered and developed by judicious training if it existed in ever so small a degree. To be a draughtsman was one thing, to be an Artist was another and a very different thing; and it was to the latter rather than the former that the efforts of the Art Schools should be directed. It was only in this way that they would fulfil the function for which they were intended, which was not to turn out great Painters, Sculptors, and Architects, but to train students in the Applied Arts, as they were called, or as it had been otherwise, though not very happily, expressed in the application of Art to industry.—Mr. Jackson spoke of the importance of the Industrial Arts as compared with the Fine Arts, and said that they made a very great mistake and fatally under-valued the work which fell to their lot if they thought that it was a much grander thing to paint pictures, or carve statues, or design fine buildings, and to exhibit their work at the Royal Academy, or similar great annual shows, than to pass their time in designing articles of daily use and ordinary necessity. For one man who could paint a picture or could carve a piece of sculpture that would live there were hundreds who could design beautiful things in gold or silver or beaten iron, or carry out in stone or wood the decorative work on an Architectural design. It was surely a finer

thing to succeed in a task for which they were fitted than to fail in one obviously beyond their power. He went further still, and pointed out that there was no such thing as the

#### DISTINCTION BETWEEN HIGH AND LOW ART.

To distinguish them was a mischievous fallacy. The only distinction to be recognised was good Art and bad. They had suffered too long from the blindness which locked-up the Fine Arts, as they had been called, in galleries and museums, and refused to look for them at their own firesides, in the streets of their daily walk, and in every article of ordinary domestic use. If Art was to live it could only do so by colouring our whole lives, by infiltrating down to every article that surrounded us, by shaping our furniture, our personal ornaments, our common utensils, into forms comely and appropriate, by blending the tints on our walls, the tones of our carpets and curtains, the paint on our doors and windows, into delicate, harmonious, and agreeable contrasts, and, above all, by housing us within walls and under roofs which it would be a joy to look at and not of a kind to disgust us by their pretensions or weary us by their insipidity. They were all familiar with the execrable taste displayed in villas, and he only dwelt upon the subject because these were things which really touched them most closely, and that it was through them in the main, and not through picture and sculpture galleries, that Art could sweeten human life; secondly, because he wished, his audience of Art students, and those being trained like them, to feel that it was to them that the country must look for improvement in the Industrial Arts; and, thirdly, because until Art was really brought home to us in this way and coloured our daily lives, it could not be said to have any true life or power of growth in it. The lecturer dwelt upon the present-day craze for smartness, which produced all kinds of inartistic cast-iron work, formed in the

#### WORST ARTISTIC TASTE.

This was not so in olden times, for they found articles saved from the ruins of Pompeii, even those that had the most utilitarian functions to perform, formed one and all beautiful. Most articles of furniture in the present day seemed to be regarded, not as what it was, but as a vehicle of ornament, and it was smothered with decoration, chased, moulded, and carved where none at all was needed. Turning to Architecture, there, said the lecturer, was the same fatal mistake that design meant ornament. It was, however, perhaps more mischievous here, because in Architecture, more than in any other form of Art, the constructive idea should, and, from the very nature of things, to a certain extent must, govern the form. It could not be too often pointed out that Architecture was not the Art of ornamenting building, but the Art of building beautifully. Besides restraint in ornament, there should be honesty and reasonableness, and, in speaking of the artistic dishonesty, Mr. Jackson spoke amusingly, but none the less depreciatingly, of the bogus half-timbered houses and windows half sash and half mullioned. This was an offence which he and his co-examiners at South Kensington year after year declaimed against, but, though their reports presumably reached Art Schools, they, year after year, received drawings of this

#### DISHONEST ART.

He also spoke of the importance of students of Architecture making their drawings with a view to utility, and that, therefore, the sketches should always be accompanied by notes and diagrams. Then there was the same tendency to make too much of mere drawing by students of geometrical drawing, and of all kinds of drawing this branch had no claims to respect except upon the ground of utility. It had frequently been to him melancholy to see what an amount of time and labour was wasted in working-up elevations into pictures, which they never could or ought to be. His earnest advice to every student, whether male or female, was "be absolutely yourself."

## THE NEW GOVERNMENT OFFICES.

By S. J. FISHER.

A PARLIAMENTARY Committee is, in course of the ensuing Session, to be reappointed to further consider a question of Architectural taste or propriety, of the merits of which the Profession and the public should know something, seeing that any expression of authoritative opinion, individual or collective, from outside may largely affect the ultimate result. Parliament has, "to a certain extent," decided that some more Government offices should be built. The phrase is used advisedly, because experience of Parliamentary action regarding

to that policy\*. As opportunities successively offered, lands or buildings in and near Great George Street, King Street, and Charles Street have been purchased by the Commissioners of Works for the purpose of providing a site for new public offices, and some of the valuable property so acquired has lain waste and unproductive for years past.

During the year 1895 the two successive administrations took a further step forward by obtaining an Act providing for the purchase, by agreement, of other lands within the area between Parliament Street and Delahay Street, and Charles Street and Great George Street, which is generally known as the Great George Street side, the sum of £450,000 being specifically granted for the purpose, though payment of the amount is to be spread over a period not exceeding fifty years; and

such buildings, execute all such works, and do all such other things as may, in their opinion, be necessary and proper for the purpose of providing new offices on the land acquired or vested in them. With these powers the Government have command to a greater or lesser extent over four sites situated respectively at Great George Street, Spring Gardens, Carrington House, and Downing Street; and the next stage—towards which some progress has been made already—is to decide how the sites available, or which may be made so, can be best appropriated or allocated to the several Public Departments which need extending, or altogether new accommodation. In this regard Mr. John Taylor, C.B., Senior Surveyor to H.M. Office of Works, submitted a valuable series of suggestions—a settled and detailed plan

VIEW OF WESTMINSTER ABBEY, WITH SUGGESTED IMPROVEMENT IN PARLIAMENT STREET. SKETCHED BY R. FISHER.

The dotted lines show the north front of the Abbey from Grindley's Bank: (1) As at present, (2) With Parliament Street set back to the line of the present Government Offices, (3) The frontage according to Plan Two. The full view is that which would be obtained from the same spot if the "trumpet mouthed" road scheme were adopted.

public offices shows that nothing the House of Commons agrees to in this connection should be taken as absolutely settled until not only has money been voted for a definite object, but substantial progress has been made towards effecting it. Inside and outside of Parliament there has, for the last thirty or forty years, been a general agreement of opinion that it is desirable, in the interests of convenience, efficiency, and economical administration, that the public offices should be grouped in and near Whitehall; and the office of H.M. Works and Public Buildings has done what in its power lay to give effect

last year Parliament empowered the Department to acquire compulsorily any property within the area which it was unable to purchase on agreed terms, and to erect all

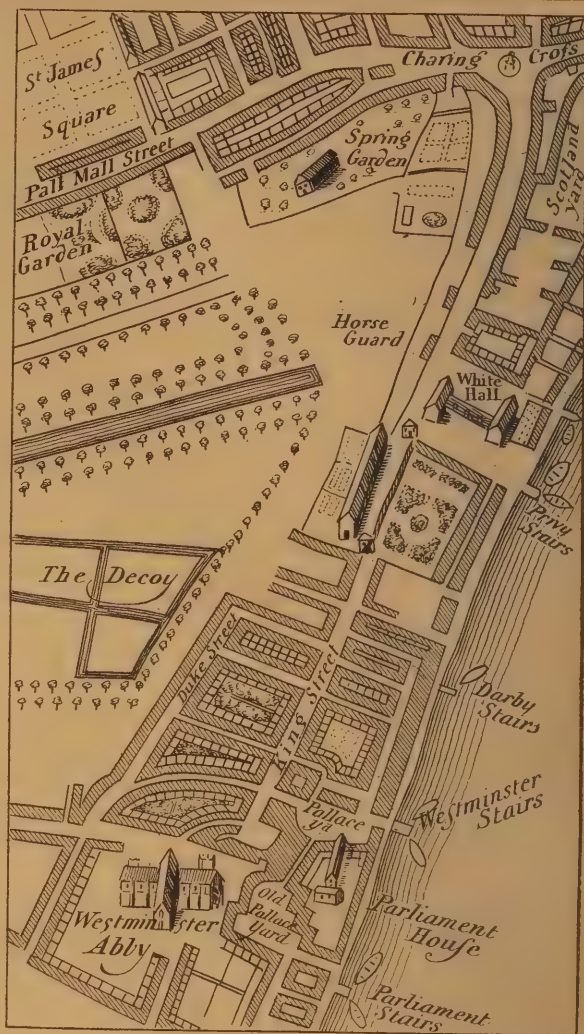

\* The business of the Board of Agriculture, Inspector General of Reformatories, Irish Office, Parliamentary Counsel, Board of Trade, War Office, Office of Works and Commissioners in Lunacy, is almost entirely carried on in hired buildings (although these are for the most part situate on Crown lands), for which rents amounting to upwards of £1600 per annum are paid by Government. These buildings are in Pall Mall, Abingdon Street, Bedford Street, Covent Garden, Whitehall Gardens, Great Queen Street, Westminster, and St. James' Square, amongst other scattered places.

indeed—to the Committee of the House of Commons, to which the question of allocation was referred. Mr. Taylor's proposals were, in brief, that on the Great George Street side new offices for the Board of Trade, (now in Whitehall Gardens and elsewhere) and the Education Department should be erected, and certain much needed additional space afforded for the Local Government Board; that at Spring Gardens—adjacent to the proposed extension of the Admiralty Buildings, and on an available triangular space belonging to the Government—the Offices and Works, and Woods and Forests

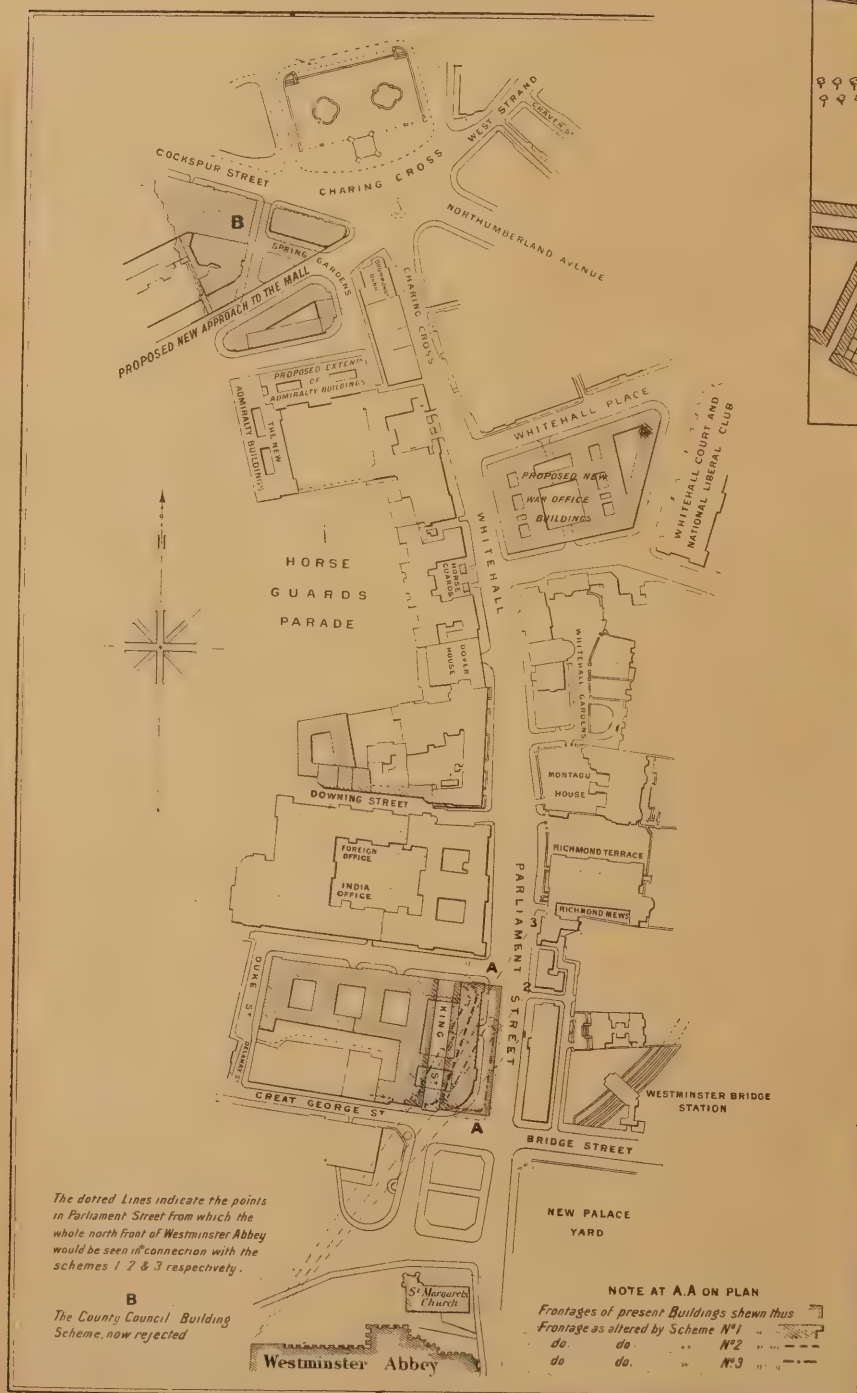

and the Secretariat of the Civil Service Commission should be placed; that on the Carrington House site the War Office (now in Pall Mall) should be erected, and that in Downing Street the Irish Office, Board of Agriculture, and Parliamentary Counsel should be accommodated. With the exception of the official residence, which has been at the disposal of all successive First Lords of the Treasury since it was handed over to Sir Robert Walpole, all the old brick buildings on the northern side of Downing Street should, in Mr. Taylor's view, be pulled down, and the street completed and extended about 90ft. upon the Horse Guards Parade, the new buildings to be in line with the corresponding angle of New Admiralty Offices. Additions and alterations would be made in the First Lord's residence, and it seems that the western view from it would be broken by the carrying out of the scheme. The adoption of the plan generally would provide a new War Office on the eastern frontage of Whitehall, the only other Government department on that side being the Charity Commission, which would retain Gwydr House; while on the west there would extend from

near Spring Gardens to the Abbey a line of public offices—Admiralty, Horse Guards, Scotch Office (in Dover House), Privy Council, Treasury (with room for the whips displaced from Downing Street), the Foreign Office block (which includes the Colonial, India, and Local Government Offices), and the new group of buildings on the Great George Street site containing the Education Department, Board of Trade, &c. Our public servants would under this plan be suitably housed, departmental work would go forward with greater efficiency and at less cost; there would be carried out, as a part of the scheme, a widening of Parliament Street and a general improvement of the locality; while the new extension of the Mall through Spring Gardens would bring Buckingham Palace into the far background of the noble vista which would be opened from

DRAWN BY R. FISHER.

DRAWN BY R. FISHER.

Charing Cross. What will the taxpayer have to pay for all this? The cost of acquisition (or value where in hand) of the proposed sites is estimated at £1,360,000; and that of the buildings is set down at £1,280,000, but several most valuable sites would be released by providing the accommodation proposed, and would realise, if sold, it is estimated £1,130,000, leaving the net cost of the whole scheme at £1,509,000 which, if spread over fifty years, would inflict no very terrible annual burden on the public.

The Commons committee of last year made one specific recommendation; that it was desirable to acquire as soon as possible the various interests in the property at Whitehall, situated on what is known as the Carrington House site, and to proceed with the erection upon it of a new War Office; and effect is to be given to this recommendation by a Bill, of which H.M. Office of Works has already given public notice, and which will have to run the Parliamentary gauntlet during the ensuing Session. Not that there is likely to be much opposition to the measure, seeing that a number of the houses are already occupied by Government departments, and that the freehold of all the properties on the site is part of the hereditary estates of the Crown. The committee thought that on this site and on those at Parliament Street, Spring Gardens, and in the neighbourhood of Downing Street, with the aid of certain re-arrangements and exchanges of space in the existing Government departments, adequate accommodation could be provided for all the departments which it is desirable to locate in the vicinity of the Houses of Parliament. The Committee went on to observe that any scheme for additional buildings on the Downing Street site would involve the alteration or demolition of some at least of the buildings now standing there, while in the cases of the Great George Street site, and the

Spring Gardens site, important questions of street improvement arose, but as the details of these and the general scheme called in some points for more mature consideration, the Committee advised that reference be again made to them thereon next session.

One of the points, and possibly the main point, upon which the Committee hesitated to give a decision was that of the exact situation of the frontage eastwards of the Government buildings proposed to be erected on the Great George Street or Parliament Street site. This latter thoroughfare must in any case be widened on one side, so as to be in line with the Foreign Office block, but the Committee considered, though without coming to any conclusion upon it, the question of setting back the existing frontage in connection with that of the opening up at the earliest point of approach from Charing Cross of the whole of the north front of Westminster Abbey. If the new frontage were erected in line with the existing Government buildings, the whole of the north front of the Abbey would be seen from a point about the southern end of the Whitehall Club, or about 270ft. from the north-east corner of Parliament Street; a second or intermediate plan would extend the view of the whole front to Derby Street, while a third would take it back nearly 500ft., or as far as Grindley's Bank. Plan two is "neither one

thing nor the other," so that the choice obviously lies between the first or parallel road scheme and the third or trumpet-mouthed road scheme, under which Parliament Street would be gradually widened out to something over 250ft. at its southern extremity. Mr. Taylor by a re-arrangement of plan number one, was able to find in number three as much accommodation as is required without the need of acquiring more land, by leaving where they are, three departments of the Board of Trade, who do not appear to be particularly anxious to be removed from their present quarters, and although Architecturally—speaking solely of the building proposed to be erected—Mr. Taylor preferred the first scheme, he was disposed to think, having regard to the space that would be thrown open under the third scheme, that this would be the better, not only from the point of view of picturesque effect, but on the utilitarian ground, which, after all, we cannot afford to

GATE AT TOTHILL FIELDS PRISON.  
SKETCH BY R. FISHER.

despise—of the better accommodation which it would afford for the large amount of vehicular traffic running in this part of Westminster. This is, then, the question to which we invite the attention of the Profession and of the public. It will, in all probability, come before a Committee of the House of Commons again in a few weeks, and these bodies are not averse from, but indeed generally welcome, suggestions on professional matters from those competent to offer them.

However this question of frontage and vista may be settled, the acquisition of the Great George Street site by the Government, and the erection of the new offices, will involve the final disappearance of what is left of King Street, once the most important thoroughfare in the City of Westminster, and the sole road by which, for ages, king or commoner, priest or peasant, could reach Abbey or Palace from Charing Cross. It was at one period intersected by the Long Ditch, which, running where is now Gardener's Lane, and finding its way round the Abbey to the river again, with the Thames insulated Thorney Island; and over this stream Matilda, consort of Henry I., built a bridge. In the time of Henry VIII. King Street had on its eastern side gardens or meadow land, running down to the river. King Street Gate (not Holbein's Gate, which stood in a line with the south end of the Banqueting House) stood near where is now the end of Downing Street; near the southern extremity of King Street was the High Gate of Richard II. The street was so muddy and ill-kept that we read of faggots being thrown down to mend the way when a great procession was to pass, and so narrow that some of the people who crowded to see Queen Elizabeth and her nobles pass by to the Opening of Parliament were suffocated or crushed to death. Sir Thomas Knevet, who captured Guy Fawkes, lived here, and here died Spenser for lack of bread. Among other residents in this once famous street were Lord Howard of Effingham, Carew, General Fairfax, Oliver Cromwell (who indeed set out from here to Ireland), Dr. Sydenham, Lord Buckhurst (afterwards Earl of Dorset), and Mrs. Oldfield. In Gardener's Lane the industrious and

KING STREET GATE, WESTMINSTER, DEMOLISHED 1723. SKETCH BY R. FISHER.

accomplished etcher, Hollar, died with the bailiffs in his house. The first brick residence in the street, that of Dudley, second Lord North, was built about the beginning of the last century. The decline of King Street dates from the formation of Parliament Street, under an Act passed in 1756, this being one of a series of important improvements effected at about the same time in Westminster. The part of King Street extending from Downing Street southwards, disappeared not so many years ago in connection with the extension of the Government offices towards the Abbey, and the remainder will in a few years be, like Broken Cross, Fludyer Street, and a score of other once well-known spots in Westminster, but a memory.

### THE LEANING STEEPLE OF BARNSTAPLE.

BUT for the fortunate intervention of Sir Gilbert Scott, the ancient leaning steeple of Barnstaple Parish Church would, says the "Western Morning News," many years ago have been cleared away as an eyesore and an impediment. From time to time the Church had been "restored" until it became a thing of Architectural shreds and patches. Sir Gilbert Scott was consulted in 1864, and doubtless the execution of the poor old spire was again suggested, for he "expressed surprise that a feeling existed in favour of destroying it, as his impressions were strongly in its favour, it being a most remarkable and interesting structure, giving character and quaint antiquity to the aspect of the Church." It is built entirely of wood, and yet has well survived the trials of 508 years. A peculiarity about this nodding steeple is that it is not in any way tied into the tower upon which it stands. It is composed of English hewn oak, many of the timbers being selected by their natural shape for the positions which they occupy. Octagonal in shape, and the sides almost concave in character, the spire is supported on two Gothic arches of oak, springing from the walls of the tower. Upon these rest two cross beams, supporting the central stanchion, which continues to be the main support to the apex. Four smaller stanchions, and eight still smaller, form the frame of the steeple, and these are tied by cross beams, all forming a perfect network of timber. Outside, the frame is cross-boarded with inch oak, coated with lead, and how admirably effective the structure has been in resisting the elements its strength at the present moment indicates. Unlike other belfries, there are four large louvres on the same level, and higher up there are even two more. A feature of the steeple is the overhanging turrets for the quarter and hour bells, the latter thus being hung clear of the structure. Last year the set of six bells was increased to eight, the former being rehung. The heavy bells are quite distinct from the spire, the frame being fixed in the walls of the tower, quite apart from the steeple, which is, therefore, unaffected by the vibration caused by ringing. All the original six bells seem to have been recast in 1803. Curiously enough, the spire overhead turns towards the south-west, as if in protest against the action of the sun alone plays, as the ancient dial over one of the doors denotes. There has been no subsidence of the stone tower—merely a contraction of lead and oak on that portion of the spire exposed to the sun's heat for 500 years. Notwithstanding this serious (and continuous) leaning, Sir Gilbert Scott appeared perfectly satisfied with the stability of the wooden erection, and regarded it with evident interest as something unique in Architecture.

The famous monastery of the Great St. Bernard has been seriously damaged by an avalanche.

### NEW INVENTION FOR DISPELLING FOG AS APPLIED TO PHOTOGRAPHY.

THE most important feature of the re-modelling of 179, New Bond-street, which has just been completed for M. Lafayette, the well-known photographer, is perhaps the arrangement by which the studio is cleared of fog—one of the most deadly enemies of the camera. To put the case simply, the difficulty which has to be met is the freeing of the atmosphere from the foreign opaque substances which it has absorbed, and which break up the rays of the electric light, nullify its penetration, and are themselves photographed in front of the sitter. The system in question gets rid of these opaque impurities by keeping the fog out of the studio in the first place,

being carefully proportioned so that an equal distribution of warm air is obtained over the entire building. The fresh air enters the rooms near the ceiling, and the top of the room acts as a reservoir into which the fresh air is introduced, and whence it is gradually dispersed over the whole room, doing away entirely with draughts. The vitiated air is drawn out through outlets at the bottom, and both inlets and outlets are fitted with louvre registers, so that they can be regulated at will. In hot weather the fresh air is brought into the building, filtered, passed through a cooling chamber, and taken over the building in a like manner, and thus both in winter and in summer the warming, cooling, and ventilation of the building is under entire control. This it should be remembered is not a theory, it is a tested and tried practice.

We give sketches of portions of the general

179, NEW BOND STREET: UPPER PART OF FRONT. E. W. WIMPERIS, ARCHITECT.

and secondly, by thoroughly drying the air inside and so precipitating the solids which obscure it. Artifice gives you the transparent air of southern skies. The artifice in this case is represented by a warming and ventilating apparatus invented by M. Lafayette, and executed by the Sturtevant Engineering Company, of Queen Victoria Street, E.C., and may be best explained as follows:—Starting at the air inlet, where the fresh air is admitted into the building, there is a specially constructed filter through which the air must pass, and in so doing be freed of its impurities. It is then drawn through a warming apparatus composed of coils of steel steam-piping completely cased in a sheet steel casing, thereby eliminating all risk of fire. These heating coils are supplied with steam from a low-pressure steam boiler, which is so arranged in relation to the heater that the steam flows automatically from the boiler to the heater, and the condensed water returns automatically to the boiler.

The air having been purified and warmed to about the heat of a summer atmosphere, is then passed through an electrically driven fan and conveyed to the different parts of the building by sheet-iron ducts, the sizes of these

work. The upper part of the front is faced with glazed terra-cotta, partly plain and partly modelled, from the kilns of the Burmantofts Company, of Leeds, and is framed in stonework, as all non-constructural facing work of this sort should be. The stained glass and the glass mosaics of the symbolical sun on the front have been executed by Messrs. Powell, of Whitefriars. The electric-light wiring and fittings are by Messrs. Strode, and the general building work has been carried out by Messrs. Prestige and Co., of Cambridge Wharf, Pimlico. The Architect is Mr. Edmund W. Wimperis, of 22, Conduit Street, W.

ABOUT £150 has already been received in subscriptions towards the movement started for a memorial bust of the late Lord Randolph Churchill, which it is proposed to place within the parliamentary precincts.

We understand that Princess Henry of Battenberg has purchased some grates and mantelpieces from Messrs. George Wright and Son for her Isle of Wight house, having visited their showrooms in Queen Victoria Street for the purpose of making her own selection.

## GREEK SCULPTURE AND GREEK LEGEND.\*

BY F. S. GRANGER.

THE precise subject of the remarks which I am about to offer will be the Sculpture of the Acropolis of Athens, and the Legend of Athena, the divine protector of the Athenians. Both Legend and Sculpture are so intimately connected with the Architecture of the Acropolis that I trust you will not regard the time wasted which we shall devote to them. The Greek temple as a whole—taking the building along with its ornaments—has never been surpassed for excellence of design, perhaps has never been equalled. This does not prevent us from agreeing that, as Architecture only—building apart from Sculpture—some of the cathedrals and abbeys of the thirteenth century are nobler works than even the Parthenon. But if you take the two together—Architecture and Sculpture—you must assign the palm to Greece. Interesting and beautiful as Mediæval Sculpture often is, it falls short of the knowledge and technical skill of Greek Sculpture. No one can seriously maintain that Mediæval Sculpture, at any rate on this side of the Alps, is comparable to Greek work of the first or even of the second order. And this consideration will affect our estimate of Greek Art as a whole. The excellence of the Parthenon, for instance, rests upon a certain balance of subordinate excellences. It is a perfection depending upon harmony. I shall try to show how various the elements were that entered into this harmony; how Architecture, Sculpture, both applied to a building and standing free, and colour decoration, united together to express certain religious beliefs, and to answer certain religious ends. We need not be surprised, therefore, that the work of Stuart and Revett should have led, at the end of last century, to a revival of Greek Architecture, and that Vitruvius and Palladio had to yield to the Architects of the temples upon the Acropolis. This revival, however, suffered from the defects of most revivals. The Architecture of Greek temples was applied to purposes for which

## IT WAS UNFITTED.

Moreover, the spirit of the style was misunderstood in a most important particular. Colour decoration was left almost out of account. Greek buildings, on the other hand, showed a brilliant scheme of colour in which the white

marble surfaces contrasted with the gold, and blue, and vermilion of the Sculpture and the mouldings. Hanover Chapel, therefore, of which Mr. Paul Waterhouse has given an interesting account in the "Journal" of the Institute, was not a building in a truly Greek style. Architects have tried to convince themselves that certain rules of proportion are enough to ensure impressiveness of design. But the public takes little interest in the geometrical recipes of which we have heard so much, and here for once the public instinct

is correct. Greek Architecture in England has suffered still more seriously from being used without the Sculpture, for which the pediments and friezes offer the frame. Reference is sometimes made to the fact that the entrance to the Athenian Acropolis, the Propylæ, had no Sculpture in its pediments. There is reason to believe, however, that the original plan included this Sculpture. Greek Architecture stands, then, in the

## MOST INTIMATE RELATION

with the Allied Arts, and some of its apparent defects arise from the necessities imposed upon it by this relation. A building in the Greek manner, without plastic ornament and without colour, falls as far short of the true spirit of the style as the pale shadows of the Greek after-world over against breathing men and women. The very fitness of Greek Architecture, therefore, for its special purposes, led to its being found unsuitable, under the changed conditions of English life. It furnished very obvious handles for attack to those who admired the mediæval styles, and much was said about its imperfections. After these two stages, first of indiscriminate imitation, and then of equally indiscriminate rejection, there is come the third stage, that of the temper that judges, the critical stage. We are ceasing now to take sides, and are trying to understand. There is a very large public—I speak comparatively—which is interested in the development of Ancient Greek Art, and the studies of several generations of Archæologists are converging upon fairly certain results. I am attempting to focus some of these results upon a familiar field of Architectural study, in order that it may appear in its true light. I should be glad to think that we carried away a somewhat clearer idea of the actual achievement of Ictinus and his fellow Architects. We owe to Mr. Penrose a more correct idea of the exact structure of the Parthenon. There remain the further and secondary considerations on which I have touched. It has sometimes seemed to me that when we go back to antiquity, whether of the Greek world or of the Middle Ages, we ought also to carry with

179, NEW BOND STREET, THE STAIRCASE HALL. THIRD FLOOR.

\* A paper read at the Architectural Association on Friday night.

us the method and temper of the ancient critics. Matthew Arnold, in his essay upon the "Study of Poetry," has formulated a method which is strikingly in accordance with their precepts. He suggests that the student of poetry should carry in his memory a few fine lines of poetry and apply them as touchstones; not, indeed, because all fine poetry is alike, but because our judgment becomes more acute when it has before it the materials for a comparison. Let us apply this to the

#### CRITICISM OF ARCHITECTURE.

If we become thoroughly familiar with the design and detail of one or two fine examples in each kind we shall have with us a standard by which we can measure the quality of any work that may be set before us. We shall not, indeed, ask that the details of the building that we are judging shall be like those of the test example. We shall find, however, that the faults of a building of second or third-rate design will be more apparent in the presence of really good work. Such a method, it seems to me, is also the right one for those who are themselves engaged upon Design. If the mind is continually refreshed by the study of fine examples, it will become better able to criticise its own work. This is the ancient method of imitation as opposed to the modern. Let us turn back for a moment to Hanover Chapel. We are referred to the Temple of Athena at Priene for the details of the external order, and to the Erechtheum for the general proportions of the front. St. Pancras Church goes much further even than this. The building is like a composite photograph in which half the buildings of Athens are struggling for the first place. "It is a poor temper," says an ancient critic, "that is content to follow closely that which is being imitated." Hence it may be said of most of the buildings of our Greek revival that they are not in the Greek manner. It may seem a somewhat barren conclusion to this part of my paper, but I do not know how to express it better than by saying that the

#### DISTINGUISHING FEATURE OF GREEK ART

is a disinterested love of beauty. In contrast with our modern effort to be striking, or to be edifying, the Greek was content to be confined within the limits of his own Art and to seek the beautiful. The pursuit of truth for its own sake, and apart from technical purposes, finds little encouragement in the present; the pursuit of the beautiful finds even less. It is the imperishable glory of the Greek mind that it devoted itself with an enthusiasm that has never been surpassed to these two great ends. Let us now see how the Greek love of the beautiful found expression in the works of Art upon the Athenian Acropolis. This oblong eminence was the centre from which the city spread and contained the sites of the greatest sanctity. It was the Mount Zion of Attica. Long before the Persian invasions, long before the building of the Parthenon and the Erechtheum in the shapes in which we know them, Athena was worshipped upon the sacred spot to the north of the Parthenon. Several legends grew up round the place. According to the belief of the Athenians, Athena had originally to contend with Poseidon, the God of the sea, for the worship of the Athenian state, and the visitors to the Acropolis could see the olive tree which Athena made to spring up as a proof of her power. Her rival Poseidon, to show his power, cleft the rock with his trident and a spring of salt water gushed forth from the place. The King of Athens, who acted as arbitrator, awarded the palm to Athena. The contest was represented in the

#### SCULPTURES OF THE WESTERN PEDIMENT

of the Parthenon. The eastern pediment of the same building portrayed the birth of the goddess. According to a quaint old legend, she was born from the head of Zeus. A black, figured vase shows us how the event was imagined by the Athenians of the sixth century. Zeus is sitting upon a throne with a lion's head at the back, and a winged sphinx underneath as a support. He is robed in a tight-fitting tunic, and a mantle is thrown round his shoulders. He holds the lightning

in his right hand, and gesticulates with the left, while from his head Athena springs up equipped with shield and spear. Ilithyia, the goddess of childbirth, stands before Zeus, and moves her hand in a characteristic manner. Still further to the right is Ares, the war-god, armed with lance and helmet and with the Medusa shield. Behind the throne Apollo celebrates the joyful event by music on his lyre, and Hermes, the messenger of heaven, with his winged shoes, traveller's cloak, and broad-brimmed hat, is ready to carry the news to Athens. There is no reason to doubt that the ordinary Athenian believed sincerely in these legends. So strong was their belief that the tyrant Pisistratus took advantage of it, and by a curious device secured his return from exile. He dressed up a tall woman in the attire so familiar to the city, and the people seem to have been deceived into thinking that their divine patroness was recommending them to receive back Pisistratus when he rode to Athens with the pretended Athena by his side. In the height of the glory of the city the same sincere simplicity of belief was still shown. During the building of the Parthenon a wonderful piece of fortune befel, which, says Plutarch, showed that Athena did not hold aloof, but was helping to accomplish the work. A very zealous workman slipped and fell from the scaffolding, and was in a condition so dangerous that he was despaired of by the physicians. Pericles was affected painfully by the accident, but was visited by Athena in a dream, and was informed of the remedy. Of this he made use, and the man was healed. In order to record the event, the great statesman erected a statue to the goddess as the giver of health, Athena Hygieia, and the pedestal of this statue, with the inscription, is still to be seen at the entrance to the Acropolis. I do not know why we should accuse Pericles of hypocrisy here; other Athenians of the most brilliant intellectual endowments were characterised by the same devout temper as that which in their descendants struck the Apostle Paul 500 years later. Athens was not only the centre of the profoundest culture; it was also one of the most religious cities in Greece. The conclusion to be drawn is a very important one. It was first and foremost through the religious emotion that the masterpieces of Phidias and his contemporaries affected the average Athenian. Only in the second place was note taken of their

#### PERFECT WORKMANSHIP.

The rude wooden image in the Erechtheum that fell from Heaven, before which the famous lamp of Callimachus for ever burned, was doubtless more revered than the great statue of the neighbouring Parthenon. The Artist was not the master, but the minister of the religious feeling, and ran great risks if he turned aside from his appointed task. Phidias was imprisoned upon a charge of impiety because he had portrayed himself and Pericles upon the reliefs of the great shield of Athena. As the character of the Athenian State changed, so also did the character of their goddess. When the Athenians were a people of farmers, she was thought to give rains and abundant crops. Hence, in the eastern pediment of the Parthenon she is accompanied by the Hours who bring the harvest season, and by the Sisters of the Dew. As the goddess of the sailor, she contrived the magical vessel in which the Argonauts sailed to find the golden fleece, and her temple on the promontory of Sunium brought comfort to the ships that beat round that dangerous coast. As the patroness of victory she was called Athena Nice, and in order that she might never desert her people she was

#### REPRESENTED WITHOUT WINGS.

But the goddess was more than the patroness of the farmer, the merchant, and the soldier; she was the embodiment of wisdom. It was her inspiration that guided Odysseus on his wanderings, and Heracles throughout his labours. This ideal figure which reflected so closely the interests and aspirations of the Athenian state was boldly identified with the democracy, and worship was paid to her as Athena Democratia, the personification of the people. There is a beautiful little relief in

the Acropolis Museum; it represents the goddess leaning pensively upon her spear, her eyes fixed upon the memorial stele before her, which may be supposed to contain the names of deceased warriors. This charming design shows that she could sympathise as well as inspire. We may enter now, perhaps, into the spirit with which the Athenians celebrated every year the birthday of the goddess at the great festival of the Panathenaea, July 28. This began in the early morning with a procession to the Acropolis, in order to offer a new robe, or *peplos*, to the goddess—a piece of saffron cloth embroidered elaborately with the conflict between the gods and the giants. This robe was conveyed in state along the streets to the Acropolis, and there was hung round

#### THE GREAT STATUE,

or, perhaps, before it, as a curtain. Let us take the ideal figure of Athena as a clue, and let us join, so to speak, in the procession of the citizens of Athens. We shall find that the great masterpieces of plastic Art are all, as it were, set to the key of this religious ceremony; the main idea of it—the birth, the power, and the honour of Athena—being like a pervading diapason. The sculptures of the Parthenon are not exercises in which merely the skill of the Artist is displayed: they are the vehicles of living religious ideas. As we approach the Acropolis, let us suppose that the magic of fancy has restored to their former splendour the ruins of the entrance and of the temples which lie beyond. By the careful comparison of the actual remains and of the literary evidence, the Archaeologists of this century have gradually restored the arrangement of the works of Art upon the Acropolis, and we are enabled by their aid to substitute for the existing ruins a picture in which the buildings and the sculpture are united into a harmonious whole. The view is taken from the restoration of Thiersch. One of the most prominent objects was the colossal bronze statue of Athena the Defender, which rose to a height of 25ft. The point of the spear was visible for a great distance, and the sailors, as they were tacking up the Saronic Gulf from Sunium, kept a look out for the moment at which the familiar landmark should appear across the low hills of the coast. This work has perished, without leaving any visible trace, except a rough representation upon certain coins. As you pass between the columns of the Propylaea on to the rocky plateau, the eye is caught by the rich colour of the crystalline limestone rock. It is of a heavy red or maroon passing into dark purple or indigo. But in some lights the effect is changed. My first view was gained one evening as the sun was nearing the horizon, and the rays of light, which were almost level, so struck the surface of the limestone that it seemed of a light rose colour. Against this the white columns of the Parthenon stood out with great streaks of dull gold where they were stained by the weather, while, behind the rock and the white marble and the weather stains, the clear evening sky formed a background. In a well-known passage of the Seven Lamps

#### MR. RUSKIN COMPARES

to their disadvantage, the Greek temples with the coloured Architecture of Venice. But nothing can be more wonderful than the strange flickering of the white marble columns as they seem to flame out against the blue. Over this brilliant foundation, coloured ornament was applied, like a delicate embroidery, to the chief Architectural features. As you pace the summit of the Acropolis you can see many a marble moulding still carrying the traces of this. Colour was applied to Sculpture by the Greeks not less systematically than to their buildings. It is curious that the notion of coloured statuary should be so repugnant to the prevailing taste, and yet there is scarcely a museum of classical antiquities in which traces of colour are not to be found. We saw that, for want of colour, Mr. Cockerell's Hanover Chapel, with all its elegance, was not in sympathy with the true spirit of Greek Architecture.

(To be continued.)

## THE EDUCATIONAL TRAINING OF ARCHITECTS.\*

By LEOPOLD EIDLITZ.

DURING the last half of the present century the questions "How are Architects to be Educated?" and "Are we ever to have a New Style?" have been prolific sources of discussion. The answers to the first of these questions vary between the two extremes—"Architects shall not be educated at all," and "They shall be taught to know everything"; and to the second, that "We will probably never have a new style, but that such a thing may happen in the course of time"—a long time. These discussions are carried on with mutual forbearance and good feeling, but without any other result than an expression of opinion by the majority of the disputants that students of Architecture shall learn something of the technique of building, if this can be done without the suppression of inherent genius. Genius in this case means a lively poetic imagination, capable of remembering, selecting, and combining existing forms into a whole, which shall be picturesque. It has been observed by practical Architects that an extended mathematical and scientific training breeds able constructors (engineers), but is detrimental to the Artistic perceptions of the students. Existing forms may be repeated or combined by human imagination, but new forms can result only from

## NEW FUNCTIONS LOGICALLY DEVELOPED.

Up to the thirteenth century, Architects were builders who arrived at progressive methods of construction, mainly by practical experiment, the laboured results of which were stored up as rules-of-thumb by guilds and individuals, and modelling and decoration were mainly matters of feeling, but of the feeling of men who thoroughly knew their methods of construction. The guilds and their rules are past and gone, but during the last century the science of mechanics has been developed. This science enables us to compute with precision the strains caused in all combinations of matter which have served, or may hereafter serve, to form structural elements. To illustrate briefly: We know, a certain distribution of weights being given, which is to be sustained between two points of support, what is the line of pressure caused by these weights, hence what the form of the arch to sustain them with the least amount of material? Or, the form of an arch being given, what is the ideal distribution of loads which corresponds accurately to its resistance? Or, again, the form of an arch being given, which we know *not* to correspond with the distribution of its loads, what will be the magnitude of the strains produced in any part of it, and how are these strains to be resisted? We know exactly what is the lateral pressure of a given arch, and what is the stability of an abutment needed to resist it. We can compute the transverse strength of a beam or a lintel, the bending moment of a pillar, or the deflection of either, under loads so small that it cannot be measured. Now, we are all ready to admit that this knowledge is useful, and perhaps necessary to the student of Architecture, to enable him to construct buildings that shall be stable and enduring; but many of us doubt that it has anything to do with Architecture as a fine Art, which means with the composition of Architectural monuments which shall be beautiful to look at and expressive of their purpose and meaning. I presume that all Architects agree that form, modelling, and decoration constitute

## THE ELEMENTS OF BEAUTY

and expression, and that of these *form* is the most important. If we imagine every piece of sculpture, carved decoration, and moulding removed, say, from the Cathedral at Amiens, so that nothing remains but the bulk of piers, arches, vaults, and buttresses, the ruin will still express a Christian monument of great beauty. Now, the Ecclesiastical expression is

\* A paper written by Leopold Eidlitz, of New York, and—in his absence—read by Mr. John Slater at the Royal Institute of British Architects.

owing to what, in music, would be called the *motif*, which is Christian in character, lofty in its conception as a house of God, and in the *grouping* of its parts, which designate worship in the chevet, the presence of officiating priests in the transepts, the people in the nave, the aisles with their processions, chapels, and confessionals; while harmony is certainly due to a just and accurate treatment of structural parts and their mechanical value, which is determined by local strains. In music, neglect of a strict mathematical relation of sounds results in discord. So, in Architecture, harmony of form can be attained only by a strict observance of the mathematical relation of strains. Harmony of strain means that stress should be always resisted by a proportionate amount of material—no more, no less. This does not mean that there should be no more material used than is absolutely necessary to perform a given amount of mechanical work, such, for instance, as we consider proper in economic structures, factories, warehouses, tenements, &c.; but, whatever the amount of material to be used in a given Architectural monument, which, in the opinion of the Architect, is commensurate to its character of stability, dignity, and elegance, shall be proportionate to actual strains throughout the whole design. To be explicit, each building material sustains a certain amount of strain at the breaking point. The actual strain permitted in any structure in practice is but a fraction of the ultimate strain of the material at the breaking point. This fraction is known as the factor of safety, and should, for the same material, vary in different buildings in accordance with their dignity. The Architect may use

## ONE FACTOR OF SAFETY

for a schoolhouse, another for a library, and yet another for a Church. The factor of safety so chosen becomes the keynote of his design, and a constant reference to it insures harmony. Factors of safety vary with the different materials, and more or less depend on limits of elasticity, methods of construction, probable effects of the weather, corrosion, &c. Strain is the sum of weight, its direction, and resulting bending moments. It appears from the above that the greater the ultimate resistance of the material the greater is the admissible maximum strain, hence the more elegant the structural forms. It occurs that in the use of modern rolled iron, form becomes attenuated far beyond the limits of the forms the Architect is familiar with. It may be asked here, and doubtless many a respectable member of our Profession would ask, what the author could have done with an ugly iron or steel pillar riveted up of rolled material? Without discussing that question at this time—although it may be asserted with confidence that a post of that description is not at all outside the pale of aesthetic possibilities—it may be suggested that a cast bronze column was perfectly practicable, and so was a granite column of sufficient diameter to carry the load. What the Architect had in mind, however, was not the question of mechanical work to be done, nor the question of relative strains and an harmonious Architectural development of forms, but the beauties of the Greek portico, which must be preserved in spite of new conditions and the invention of new material. Of course, no new style of Architecture can be expected when new conditions, such as a twenty-five story office building—or the invention of a new material, such as rolled steel—are referred to the Greek portico, instead of the law of gravitation.

## A GREAT STUMBLING-BLOCK

to the student of Architecture is the constant and exclusive reading of its history, which is tacitly presented by schools, and avowedly accepted by students to be a system of building which serves all the purposes of a philosophy—or a Science and Art—competent to teach building scientifically and artistically under conditions which never occurred in the history of the past. The mathematical training in modern schools and Universities is usually sufficient to enable the student to devise methods of construction, and when devised, to compute with accurate resulting

strains. Students who then enter an Architectural course are turned over to a special teacher of Architecture, who tells them to design buildings of any kind—from a storehouse to a Cathedral—not in accordance with their acquired knowledge of mechanics, but in accordance with methods pursued by the Greeks, the Romans, &c., who were not at all familiar with the science of building as now understood, but who constructed merely in accordance with their practical experience. For further information the student is referred to *Art History*. Now, the Greeks, the Romans, and the master-builders of the Middle Ages, though not scientific in the modern sense, understood form, because they practically knew the mechanical function of structural elements, and had a realising practical sense of the relation of masses, hence also of the form, modelling and decoration of these masses. The modern student of Architecture has no experience in building, and when he enters the academic course, discards from his mind his previous scientific attainment, which never existed in the shape of forms, but merely in

## AN AGGREGATION OF MATHEMATICAL REASONINGS.

He is not taught how to refer to that reasoning in developing forms, but instead, is asked to study forms in the abstract as presented in history. The system of the *Ecole des Beaux-Arts*, which is imitated in many schools outside of France, is utterly subversive of possible logical Architecture. Students are required to prepare sketches, often of important Architectural monuments, in from six to sixteen hours. By rules of the school, these sketches may be measurably foggy, as long as the finally completed drawings can be construed to be somehow indicated in the original sketch; this means that the process is a matter of composition of form, and not a rational development. Criticism of these designs by teachers admits transgression against good construction as comparatively pardonable, but insists on observance of traditional treatment of form as imperative. The study of Architectural history (more especially if perused critically) is doubtless beneficial to the Architect, but should be postponed for a post-graduate course, or should be left for private reading after the academic course is completed. A future text-book of Architecture for Universities, polytechnic schools, and academies of the Art of Architecture, will doubtless bear the title "The Theory, Practice and Art of Building." . . . What is meant by Architectural scales may be best illustrated by one or more examples, for instance:—Given a pillar of a certain length, and the load it supports in pounds, what will be its sectional area, and what its form, modelling, carved ornament, and colour decoration (if any) in a warehouse, a public school, a library, a court-house, and a parish church, when the pillar is made of wood, cast iron, wrought iron, bronze, brick, sand-stone, marble or granite. The text-book would answer these questions, and illustrate the answers by drawings and diagrams. It would state how variations or treatment would accrue by reason of difference in the length of the pillar, also how pillars of similar nature have been treated in notable monuments of the past, and discuss the merit of such treatment, and point out its material defects. Wall piers considered as pillars would be treated in the same way. Then would follow the consideration of braces, capitals, and corbels. Further, that of lintels, arches, groins and cupolas, and the resulting lateral pressures and abutments, and also of roofs, stairs, and incidental structural elements. Assuming the Architectural scales to comprise the first part of the text-book, the second part will treat of the

## CONSTRUCTION OF SINGLE CELLS,

and the combination of these into piles. The students would attend lectures on the *rationale* of structural elements and composition, but would devote most of their time to drawing structural parts, and finally entire buildings and monuments, not by copying from the text-book, but by an individual treatment of the subjects contained therein under the guidance

of a professor and his assistant or assistants. The latter would see to it that adherence to strain is strictly pursued. By this process, students would in their work be corrected and helped daily, and would progressively acquire a habit of referring design to building, and its mechanical import. That monuments thus conceived and designed will be expressive of their meaning, and the individuality of their author, cannot be doubted; nor that they will be harmonious in themselves and will vary from the forms of the past in the degree as new wants, new material, new methods of construction vary and excel those handed down to us in history. When a natural organism decays and dies, it still exists in its elements, though not in its original form. These elements under different environments combine again into new organic forms of different function. Science and Art obey a similar law. Principles established by experience continue to live as accepted truths, when the forms of artificial organisms which they originally developed have ceased to be fitting or useful to human needs, more especially when those principles first crudely announced have become accurately determined by quantitative analysis. The cross-bow and modern rifle, the spinning-wheel and the present spinning-machines, and ancient galley and the armoured steamer, all serve as practical illustrations of the above. Architecture alone, of all human pursuits, retains obsolete forms, and neglects underlying principles and organic laws. It must be remembered, however, that this was not the case prior to the fourteenth century. Five hundred years of decrepitude leads thinking minds to question a possible resuscitation; and when now and then such a possibility is seriously contemplated, we talk of centuries and generations, because past progress has consumed such periods of time. But when we consider the great strides of the present century, owing to the knowledge and application of positive scientific methods, the metamorphosis of Japan, for instance, within the last generation, purely by the acknowledgment and practical acceptance of these methods, we must come to the conclusion that a period of one generation is quite sufficient to initiate renewed rapid progress in Architectural Art, always provided that we are willing and helpful to refer it to its true and fundamental principles, and to teach it rationally.

### EXETER CATHEDRAL.

THE Dean and Chapter of Exeter, says the "Daily Chronicle," are obviously a good deal afraid of the Society for the Protection of Ancient Buildings. The committee of that society, having ascertained that certain work was in progress on the west front of the Cathedral, wrote first to the Cathedral Surveyor, Mr. E. H. Harbottle, and asked him what was actually being done to the west front. Mr. Harbottle replied "that necessary repairs to the west front of the Cathedral are being done under the direction of the Dean and Chapter;" whereupon the committee wrote to the Dean and asked whether he would allow the society to know what was being done. The Dean was abroad, but Canon Edmonds showed the communication of the society to the other members of the Chapter, who, "with all the courtesy that is due to your society," informed that body that the Dean and Chapter "do not wish to be brought into relations with it in the matter of what we are doing at the west front of the Cathedral." From our own correspondent we learn that all that is being done is the restoration of carving, mouldings that have been nearly lost sight of, and some of the stepped blank arcading in the gable, together with the restoration of the great west window.

THE Baths Committee of the Islington Vestry has reported in favour of the erection of Turkish baths, capable of accommodating from thirty to thirty-five persons at a time and "fitted in the most approved manner," as an addition to, the Hornsey Road Public Baths.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 10th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

WE learn that the plans for extending the accommodation at the Guildhall School of Music by the provision of additional classrooms are being proceeded with, but it is not probable, owing to the interests that have to be considered, that the scheme will be ready for submission to the Court of Common Council for at least a month at the very earliest. The Music Committee is fortunate enough to include amongst its number four Architects, and they have been, as it were, constituted as a sub-committee to arrange the technical details, and put into shape the rough ideas that find favour. It is likely that the scheme will prove a more costly one than was at first thought probable. It will not, however, provoke opposition on that score, as the Committee propose to submit with the building plans, a suggestion that will have the effect of sensibly augmenting the income, while at the same time reducing the expenditure of the school.

THAT the London County Council has declined to contribute towards the cost of the proposed widening of Watling Street is to be regretted. To call the improvement one of metropolitan importance is an exaggeration however; as a matter of fact, it will chiefly benefit the warehousemen, who, under existing circumstances, experience at times no little difficulty in receiving and despatching goods with any amount of expedition. For the future, the Sewers Commission will be well advised to confine their applications to the County Council to improvements that must be generally admitted to be metropolitan in character.

THE new laboratory which is being built in Clement's Inn for the Somerset House analysts is not so far forward as the Board of Works expected it would be, considering the time it has been in hand; it looks now as if it will take another twelve months to complete, although the total contract is only some £23,000. The space which the analysts are occupying in Somerset House is very badly wanted by other departments in the building. In the laboratory the staff used to number 43, now it is 74 strong; but as all these will migrate when the building in Clement's Inn is completed, the congestion in that branch will only be comparatively short-lived. The growth in all other departments has been almost equally great, and judging by the experience of previous years, it will continue.

A NEW military hospital is to be erected outside London in connection with the scheme for fortifying the City. The proposal has been under the consideration of the military authorities for some months, but it was difficult to obtain a suitable site. Within the last few days such a site has been secured in a central position so as to be easily reached from any part of the fortified hill tops. Plans have already been prepared, and it is expected that in a few days the work will be commenced.

By the erection recently of a substantial Portland stone wall at the Embankment side of Somerset House, near Waterloo Bridge, a great improvement in the appearance of that handsome pile has been effected, the work having been carried out in unison with the prevailing style of Architecture of the building. The part thus reclaimed was formerly known as the Dock House, and was in use a few years ago as a waterway for the entrance of barges from the river into Somerset House. In addition to the erection of the wall, a large room has been constructed which will be used as a repository for papers, &c. The work has been carried out under the direction of Mr. Williams, Clerk of the Works, Royal Courts of Justice.

Two recently elected full members of the Academy will serve this year on the Council—Messrs. Richmond and Broughton. The rule is that the recent R.A.'s take their places amongst the five new members who at the commencement of each academic year succeed to five out-going members. Thus in the year 1894 four of the five—Messrs. Alfred Gilbert, MacWhirter, Henry Woods, and Henry Moore—were R.A.'s elected within the twelve months. This year there have been many vacancies filled up, Messrs. Crofts, Jackson, and Sargent, in addition to the two already mentioned. These new R.A.'s, however, have not to serve this year. The Academy has a further rule that no full member's election can be regarded as complete until he has actually received his diploma. Till then he is an "Academician elect." Six months have to elapse from the date of election till the presentation to the Queen, and the sending in to the Academy of the diploma picture and its acceptance are conditions precedent to the ceremony.

A QUAIN old building—another link with the past of Barnstable—has just been demolished in Boutport Street, close to the site of the North Gate, and adjoining the premises of Mr. J. Rowe. From the oak panelling and general construction, it appears that the house was of Seventeenth Century construction and style, but compared with surrounding buildings, it appeared to the ordinary passer-by as possessing greater antiquity. Considering the ancient character of the Borough, there is a surprising absence of the antique in building at Barnstable. A couple of houses at Newport are believed by experts to be much older than the one which has just disappeared; and the interiors of others have undoubtedly respectable antiquity, even if their frontages have been modernised.

THE Committee charged with making arrangements for the erection of a statue of the Queen at Dundee, in commemoration of her sixty years' reign, has had a consultation with Mr. Harry Bates, A.R.A., who has been commissioned to design and erect the statue. A good deal of conversation took place in regard to the bas-reliefs, and ultimately it was left to Mr. Bates to make suggestions and submit models. A strong feeling, however, prevailed that the bas-reliefs should be representative of the characteristics displayed by the Queen in her long life, such as her visit to the wounded soldiers on their return from the Crimea, and her humility and kindly acts in her Highland home. As to the statue itself, nothing definite was fixed upon; but suggestions were made that the bronze figure of her Majesty should be in a sitting posture, and that the pedestal should be of granite, the whole rising to a height of about 15ft.

THE suggestion that the Chelsea Vestry should apply to Lord Cadogan to have conveyed to them the old Chelsea "Physic Garden" on the Embankment near Cheyne-walk, in commemoration of the Diamond Jubilee, seems to offer a faint hope of a satisfactory termination of a long-standing agitation; but unfortunately the matter does not rest with Lord Cadogan, but with the "Apothecaries' Company. The case affords a striking example of how the objects of the "pious founder" may be frustrated, and mischief done where good was intended. The

garden was conveyed in 1721 by Sir Hans Sloane, then Lord of the Manor of Chelsea, to the Apothecaries' Company by deed of gift, on condition that it should at all times be continued as a "physic garden" for the "manifestation of the power and wisdom and goodness of God in creation, and that the apprentices might learn to distinguish good and useful plants from hurtful ones." But the "Royal Botanic Garden," as it is officially called, is now surrounded by houses, and is really no use for these purposes; and though there is a greenhouse and a medical library there, the growing of medical herbs has come to be a mere formal compliance with the terms of the gift. Science would certainly lose little by converting this quaintly pretty spot, with its statue of the worthy Sir Hans and its magnificent old cedars of Lebanon, into a pleasure garden open to the public. At present it is hidden from sight on one side by a high and particularly ugly brick wall, and on the other can only be dimly discerned through a close set iron railing.

MR. H. HARDWICKE LANGSTON writes to the Times, under date March 1st, that the condition of some of the paving of Gray's Inn Road is at present a standing menace to the public safety. "Recently," he says, "a loaded omnibus was overturned, near King's Cross end, by the wheels coming in contact with the tram lines, the wood paving having worn away, leaving the metals standing up as a kerb in the roadway. I noticed a coal wagon athwart the lines last week, with a hind wheel broken from this cause, as I was informed, and of course blocking the traffic. A loaded tramcar following was pulled out of its track, and made a detour to get on to the line again at the imminent risk, as it seemed, of being overturned. On passing this morning I measured at one place where the metals were nearly two inches above the sunken or worn-down wood pavement. This was opposite one of London's hospitals. It struck me at the time that it would be a useful contribution to hospitals if 'street accidents' which could be prevented were not made the means of drawing on their limited funds."

At the weekly meeting of the London County Council last week, the Works Committee submitted a return of the cost of estimated works which have been completed by the Works Department during the half-year ended September 30th last. This shows that the total value of the work executed in the six months was about £149,000, of which £11,357 was for jobbing works. Of the nine principal works, four were executed slightly under the revised estimates, two slightly exceeded the estimates; two were considerably in excess of the estimates, and one was considerably under. Mr. Adams, the newly-appointed manager of the department, has made a report giving reasons why in the case of the erection of dwellings at Shelton Street, and in the widening of Sandys Row, the work should have cost much more than the estimate. With respect to the first-named work, where the excess is nearly £3000, Mr. Adams points out that there were considerable delays after it was started in carrying it out, for which the Works Department was not responsible, and which enhanced the cost. The blocks of buildings were in very confined areas, and separated from one another by intervening streets and houses, causing great inconvenience, increasing the cost for superintendence, lighting, watching, &c., over the amounts provided in the estimate. With regard to the Sandys Row widening, Mr. Adams says that the excess cost on this work amounts only to about £346, nearly the whole of which was spent on hoarding, &c., not allowed for by the late manager when accepting the estimate. It was assumed that the courts opening upon Sandys Row could be closed, and that but little hoarding would be required, but afterwards, owing to complaints from the inhabitants, an additional expense of £312 17s. 5d. had to be incurred for constructing special hoarding, and providing and watching gangways fronting each of the five courts with double gateways to each for the passing of steam cranes.

## Professional Items.

ABERDEEN.—The interior of the Town Hall and Council-Chamber has just undergone a needed renovation. The work was placed in the hands of Messrs. Hay and Lyall, who emblazoned the ceiling and otherwise decorated the interior of the hall exactly twenty years ago. The ceiling, as is well known, is in panels decorated with the coats of arms of prominent town and county families. These have required no attention since 1877, but as difficulty has often been experienced in distinguishing the various family arms, each of the eighty-four panels has now been fitted with a silver scroll with the family name picked out in black letters below the heraldic device. Seven of the panels are still retained, with black shields, and can be filled in as occasion may arise. The walls and cornice have been re-decorated in the colours recommended in 1877 by Sir George Reid, P.R.S.A.

CASTLEBAR.—The first sod of Castlebar new Church was turned last week. The new Church will be erected in close proximity to the old one. Mr. Walter Doolin, Dublin, is the Architect.

CHURCHOVER.—The re-opening of the interesting old parish Church at Churchover took place a few days ago. For many years the Church had been gradually going to decay, and in the past, attempts have been made from time to time to patch it up. The oldest portion of the Church is a small tablet, now built into the new west wall, and this is supposed to be older than the font, which is of very early Norman period, and older than the records of the Church, which date back to 1321. Necessary funds, estimated at about £2500, being guaranteed. Messrs. W. and C. A. Bassett Smith, Architects, of London, were consulted, and it was found that it would be necessary to practically re-build the Church entirely, with the exception of the tower. On Ash Wednesday, 1896, Messrs. King and Ridley, to whom the work of re-building was entrusted, commenced the demolition of the old Church. The only portions which it was found possible to retain were a window now placed at the east end of the north aisle, three arches in the south arcade, and the north door, which has now been hung at the south entrance. The beautiful monuments, which had been very improperly fixed on the chancel walls, have been placed at the west end of the south and north aisles. For the miserable old gallery, lighted by skylights, the north aisle has been substituted, and the chancel has been built in its original shape, namely, square instead of a rounded end. The building itself has been built with Weldon and Atterton stone, with a tiled roof, the interior of the roof being of Baltic fir in the Decorative style, to match the other parts of the building.

DERBY.—Cardinal Vaughan performed the opening ceremony of the new Roman Catholic Church of St. Joseph, at Mill Hill, Derby. The site was purchased in 1876, since which time a school chapel has existed on it. The plans were prepared by Mr. James Hart, Architect, of Corby, Grantham, and the contract was given to Mr. J. Clarke, builder, of Nottingham. The foundation stone was laid last April.

St. Peter's Church is admittedly sadly in need of restoration, and it appears from the scheme on foot that nothing short of the rebuilding of a large portion is contemplated. Already nearly £2300 has been promised, and £4500 more is needed. Messrs. Walker and Slater have the work in hand, and the restoration of the north aisle and nave has been already commenced.

DUNDEE.—Mr. George C. Buchanan, Dundee Harbour Engineer, has prepared a report with reference to the proposed extension of the eastern wharves and the erection of sheds. He states that in accordance with instructions the new shed has been designed 300ft. long by 120ft. broad, and its estimated cost is £5500. He had carefully considered the

suggestion as to a relief shed on the north side of the eastern sheds, and he believed that such a shed would be of immense service. The proposed shed must, he thought, largely relieve the congestion. He had, therefore, prepared a plan for a shed similar in size to the new shed, but in lieu of brickwork and masonry walls he proposed to use steel ribs covered with galvanised corrugated iron. If used as a store, such a shed would hold 40,000 bales of jute, would be quite as durable as those constructed of masonry, and would cost complete about £3000, or less than three-fifths of the cost of those now in use. With regard to the proposed shed on the site of the southern section of the sheds at the Cattle Depot, it would, having regard to the condition of the river wall and wharf at that point, be inexpedient to build a shed without first having these repaired. The report will be considered at an early meeting of the Works Committee.

The contract for the mason and iron work of the new Pearl Assurance offices in Dundee has been placed with Messrs. D. and A. Powrie, builders, Dundee. The contract price of the new structure is between £3000 and £4000. Building operations have already begun. The Architects are Messrs. C. and L. Ower.

DUBLIN.—Mr. Edward Lee last week opened the extensive premises which have been entirely reconstructed in Mary Street, Dublin. The building covers an area of nearly 4000ft., and has been erected from plans prepared by Mr. W. Kaye Parry, of Dame Street. The contractors were Messrs. Joseph Pemberton and Son, Charlemont Street, and all the plumbing work has been executed by Mr. T. W. Little. The shop itself extends the whole depth of the block, and is about 35ft. wide, and the balconies or galleries are approached by a staircase.

EXETER.—Gifford's Hotel, High Street, Exeter, has just undergone considerable alterations and extensions at a cost of £600. The old refreshment-room and entrance-passage in Castle Street have been entirely re-decorated and fitted. The walls and ceilings are lined with lincrusta Walton, finished in chrome tints, with fittings in mahogany. The internal portion of the shop towards High Street is decorated and fitted in a somewhat similar style, but an entirely new front has been put in. The whole of the work has been carried out by Exeter tradesmen from the designs and under the superintendence of Mr. J. Archibald Lucas, Architect. The general contractors were Messrs. Tree and Bolley, the decorator, Mr. R. J. Mills, the plumber and gas-fitter, Messrs. Hubber and Son, the upholsterers, Messrs. Mark Rowe and Sons, the carvers, Messrs. Hems and Sons, and the suppliers of the cut glass, Messrs. E. James, Rowe, and Co.

HUDDERSFIELD.—The Thornton Lodge New Wesleyan Chapel, Huddersfield, was formally opened on the 24th ult. The building has been erected from the designs and under the superintendence of Mr. W. H. Blakeley, of Netherton, the honorary Architect. The interior of the chapel presents an attractive appearance, is well lighted and ventilated, and is heated by Messrs. Milan's hot water system. It will comfortably accommodate about 200 persons. There are also a school-room and two vestries.

During the past few weeks the interior of St. Paul's Church, Huddersfield, has undergone re-decoration, &c. Messrs. Lunn and Cardno were entrusted with the decoration, and J. H. Taylor and Co., Macauley Street, had charge of the electric light installation. Mr. I. Hordern has presented to the Church a reredos in the form of a triptych in oak, richly moulded. The lower portion of the triptych consists of a moulded base of several members, above which are four cusped panels, the dividing styles of which are carved representing the vine and the rose. The reredos has been made by Messrs. Buckley and Co. Messrs. Graham and Jessop have carried out all the structural work involved in the raising of the pulpit, and fixing of the reredos.

**KEIGHLEY.**—The Keighley Cycling Club has erected a new club-house in Cavendish Street. The building was formally opened last week. The new house has been designed by Messrs. W. H. and A. Sugden, Architects, Keighley, and about 120 to 150 cycles can be stored in the basement. The ground floor is mainly occupied by a large cycle shop; and the first floor is a lofty and commodious club-room, committee-room, dressing-room, &c.; the second floor is occupied by a billiard-room, well-lighted from the top, a refreshment bar, card-room, &c. The cost of the entire undertaking cannot be much less than £3000.

**KESTEVEN.**—At a meeting of the Asylum Committee of the Kesteven County Council, held at Sleaford, the plans for the proposed Asylum at Rauceby were considered, together with the report of the Umpire. The plan of Mr. G. T. Hine, of 35, Parliament Street, London, has been accepted, his estimated cost being £96,000. A premium of £150 has been awarded to the second best plan from Messrs. Giles, Gough, and Trollope, 28, Craven Street, London, and a premium of £100 to Messrs. Henry Crispe and Oatley, of Clare Street, Bristol. The accepted plan has now to be approved by the Lunacy Commissioners and the Home Secretary, while the County Council has also to signify its assent. Under these circumstances the work will be scarcely commenced before next winter. The erection of one asylum recently, somewhat similar to the proposed buildings at Rauceby, occupied over three years before it was completed.

**LONDON, S.W.**—The Bishop of London consecrated, on the 1st inst., the additions which have been made to St. Gabriel's Church, Pimlico. The additions, which consist of north and south aisles, a new south chapel, a west gallery, and a west porch, have been carried out by Mr. John Thompson, of Peterborough, at a cost of £6000, from the designs of Mr. Arthur Baker, of the firm of Messrs. Baker and Turrill, in harmony with the original design. The interior has been enriched by the groining of the roofs of the aisles, and by the richly-carved oak front of the west gallery carried on a stone arcade. The chancel has also been beautified by a new east window, designed by Mr. Kemp.

**LOWESTOFT.**—The memorial stones were laid on the 4th inst. of the new home of the Lowestoft Young Women's Christian Association, on Regent Road. The Architect, Mr. Alfred Clark, prepared designs for a building combining an institute and a home, part of these being now carried out, while there is ample room for further extension when desirable. It is plainly constructed of red bricks, with string courses and red stone dressings, while there will be a tower at the Regent Road corner.

**OYNE, N.B.**—The public school at Oyne, which has been closed during the last seven months, pending the carrying out of important additions and improvements, was formally opened on Friday, the 26th ult. While the space in the school, both superficial and cubic, has been adequate to meet the Department's regulations, the obsolete character of the building, and specially the defective ventilation and lighting, has on various occasions been unfavourably commented on by H.M. Inspector. After consultation with H.M. Inspector and with Mr. Duncan, Architect, Turiff, the Board unanimously resolved to remodel and extend the present building in preference to erecting an entirely new structure. The alterations projected included the heightening of the walls and new gables, an enlargement of the main room, and the provision of lavatories and cloak-rooms. Contracts were entered into with Mr. Simmers, Dyce, for the mason work; Leslie, Inch, for the joiner; Pirie, Fyvie, for the slater; Laing, Inverurie, for the plumber; and Watson, Turiff, for the painter. The result is now a building, divided into three spacious, well-ventilated rooms separated from each other by glass partitions, having each a separate entrance, and with accommodation for about 180 scholars. The cost of the alteration is about £400.

**PETERHEAD.**—Very satisfactory progress is being made with the deepening of Port Henry harbour at Peterhead. The underfounding of the piers, although somewhat delayed for a time, is now proceeding apace; and the squad of men employed at this work at various points are rapidly catching up with the deepening operations, about one-third being already finished. The masonry on the north side of the new inner jetty is all but completed, and a commencement has been made at the south side. This jetty, as resolved upon recently by the trustees, is to have an arm built at the outer end, leaving an opening of 45ft. between it and the existing jetty, in which "booms" will be provided for use in rough weather. It is expected that the inner basin, thus secured, will be largely taken advantage of by fishermen for "laying up" their boats in winter. A small portion of the debris is being utilised to reclaim a piece of ground at the Ronheads, in order to form a roadway outside the land proposed to be handed over to the Railway Company. About two-thirds of the retaining wall for this purpose has been built. By far the greater portion of the excavated material is, however, being used to reclaim a portion of the foreshore at the south bay, about 230 waggon loads being transferred daily from the harbour works and deposited on the foreshore.

**STOCKPORT.**—The large stained glass windows which have been put into St. George's Church, Heavily, which we illustrated in our last issue, were made and fitted by Messrs. Shrigley and Hunt, of Lancaster.

**SWANSEA.**—A new jetty is to be constructed at the half-tide basin of the Prince of Wales Dock, at a cost of £5000. Messrs. Thomas Watkins and Co. have received the contract.

**TAUNTON.**—A special meeting of the Taunton Town Council has been held to consider the advisability of securing a portion of the Parade as a site for the Town Hall as a memorial of the Queen's reign. It was estimated by some speakers that the hall would cost about £40,000.—The desirability of erecting the Town Hall was affirmed.

**TITCHWELL.**—Some time since the tower, roof, and several portions of the chancel of the Church of St. Mary the Virgin at Titchwell were condemned as unsafe, and an estimate, amounting to £400, for restoring the Church was prepared. The contract of Messrs. Cornish and Gaymer, of North Walsham, for £409 was accepted, and has been carried out satisfactorily, who have, in addition, spent £100 on the old Norman tower, which was found to be in a most unsound condition.

### COMMISSIONS.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—I read with much interest Mr. Bidlake's article published last week in the JOURNAL on the above subject, and entirely agree with him that a great amount of illegal commissions are accepted by some Architects and those calling themselves such—principally the latter in my experience—from tradesmen and Quantity Surveyors, and I think if your JOURNAL finds its way into the hands of other than the professional public, the exposing of such practices in its columns cannot fail to be of service to honest members of the profession, especially so if you can point out the manner in which such tricks are performed, or how they can be detected. It is somewhat of an object lesson to those "in the know" to read the article referred to and then turn to your lists of tenders, and find the tenders for several jobs, principally by one provincial firm of Architects, with accepted tenders ranging from less than £200, and to note that all of these have "quantities" taken by another provincial gentleman with a double-barrelled name. What does it mean? I have had a good many years' experience of London and country

builders, and I never yet found one who required quantities for a job of less than £1000, and in my opinion any Architect who imposes an extra 2½ per cent. on a client for quantities for a job of less than half that sum is a man who we should look askance at. Under any circumstances I think, however, that the Quantity Surveyor does not personally suffer very much, for 2½ per cent. is too much for his work if 5 per cent. is the remuneration for the Architect. His work is done and done with, and he gets his money almost at once, instead of waiting sometimes years for it as Architects have to.

I am, Sir,

Your obedient servant,

ARCHITECT.

March 4th, 1897.

### SOCIETY MEETINGS.

**The Architectural Association of Ireland.**—A meeting of this Association was held at the Grosvenor Hotel, Westland Row, on Tuesday evening, the 2nd inst., the President (Mr. R. Caulfield Orpen) in the chair. Amongst those present were Albert E. Murray, Geo. M. Ross, Joseph Holloway, vice-president, T. Slevin, M. J. Tighe, and R. Butler, hon. secretary. Mr. W. Kaye-Parry, M.A., B.E., gave a lecture on Drainage and Sanitary Construction. The lecturer gave an interesting and instructive account of the progress of sanitary science in recent years.

**Edinburgh Architectural Association.**—The Edinburgh Architectural Association, by permission of the directors, visited the North British Distillery on the 27th ult. The head brewer, Mr. S. Stevenson, conducted the party over the buildings, which occupy about eleven acres of ground, and have about sixteen acres of floor space. Henning's pneumatic drums were shown at work, and the various processes to which the grain is subjected were followed from the grain stores to the still-house. Among those present were Messrs. John Watson, T. P. Marwick, and A. Hunter Crawford.

**Leeds and Yorkshire Architectural Society.**—In connection with this Society a lecture was given at the Leeds Institute, Cookridge Street, on the 1st inst., by Mr. T. Butler Wilson, of Leeds, on "Modern House Interiors." Mr. Butler Wilson spoke of the awakening interest on the part of the public in the decoration and furnishing of their houses, and deplored the fact that Architects had allowed the direction of these matters to pass out of their hands. He suggested that the reason lay in the apathy of the profession with regard to decorative Art, and that their interest had been absorbed almost wholly by structural Design.

**Glasgow Architectural Association.**—At a meeting of this Society on Tuesday, the 2nd inst.—Mr. George S. Hill, A.R.I.B.A., in the chair—Mr. D. Theodore Fyfe read a paper on "French Mediaeval Fortifications." The essayist pointed out that past work must be studied with respect to the conditions under which it was created. He proceeded to enlarge on the different types of the domain, a chief's dwelling, showing how this building evolved in the chateau of later times. The essayist gave a description of the number of the best examples, diagrams of which were ranged round the wall, and showed that every part of these fortifications had its origin in the laws of defence.

**The Edinburgh Architectural Society.**—At a meeting of this society on the 3rd inst., Mr. J. A. Williamson in the chair, Mr. R. S. Lorimer delivered a lecture entitled "Some Notes on the Artistic Work and Influence of William Morris." Mr. Lorimer traced the history of the firm of William Morris and Co. from its foundation; dealt with Mr. Morris as a Craftsman, as a teacher and lecturer, as a founder of the Society for the Protection of Ancient Buildings, and as a publisher and printer; and showed some of the books produced at his Kelmscott Printing Press. The lecturer was accorded a vote of thanks on the motion of Mr. A. R. Scott, seconded by Mr. Lorne Campbell.

## CONTRACTS OPEN.

**BARNET URBAN DISTRICT COUNCIL.**  
PROPOSED BUILDINGS AND DEPOT  
IN TAPSTER-STREET.  
EXTENSION OF TIME.  
TO BUILDERS.

TENDERS are invited for the ERECTION of FOREMAN'S COTTAGE, FIRE-ENGINE HOUSE, STABLE, BOUNDARY WALLS, and GATES at the above Yard in Tapster-street.

Plans and specification may be seen daily between NINE a.m. and FIVE p.m. on application to the Surveyor, at the Council's Offices, 40, High-street, Barnet.

Tenders, sealed, and endorsed "Tender for New Buildings, Tapster-street," to be addressed to me, and delivered at the Offices as above, on or before WEDNESDAY, MARCH 24th.

The lowest or any Tender will not necessarily be accepted.

H. W. POOLE,  
Clerk.

Barnet,  
March 3rd, 1897.

**BIRMINGHAM CORPORATION.**  
WATER.—ELAN SUPPLY.  
CONTRACT No. 6.—FRANKLEY RESERVOIR,  
FILTERS, &c.  
TO CONTRACTORS.

The Corporation of Birmingham are prepared to receive TENDERS from competent persons willing to enter into a contract for the CONSTRUCTION of about 14 miles of RAILWAY, a LINED SERVICE RESERVOIR to hold 200 million gallons, Eighteen FILTER BEDS having a total area of about 67,000 square yards, with the necessary inlet, outlet, washout, and overflow arrangements, and for other WORKS described in the bills of quantities.

The drawings may be seen, and specification and bills of quantities obtained, at the office of the Engineer, Mr. JAMES MANSENGH, 5, Victoria-street, Westminster, on the deposit of a cheque for £20, which will be returned after the receipt of a bona-fide Tender with the bills of quantities fully priced out.

Early application for particulars is necessary, as only a limited number will be given out, and none supplied after the 10th day of MARCH.

The Contractor will be required to undertake not to

pay less than the minimum standard rate of wages current in the district in which the works are situate. Sealed Tenders, addressed to me, and endorsed "Tender for Frankley Reservoir, &c. Contract No. 6," are to be delivered at my Office (post paid), at or before NOON of WEDNESDAY, the 31st day of MARCH next. The Corporation do not bind themselves to accept the lowest or any tender.

EDWARD ORFORD SMITH,  
Town Clerk.

Town Clerk's Office, Birmingham,  
Feb. 22nd, 1897.

**TO BUILDERS AND OTHERS.**

The Metropolitan Asylums Board are prepared to receive TENDERS from persons willing to contract for the ERECTION of an ISOLATION PAVILION at the Northern Hospital, Winchmore Hill, N., in accordance with plans and specification prepared by Messrs. PENNINGTON & SON, Architects, Hastings House, Norfolk-street, W.C., where such plans may be inspected between TEN a.m. and FOUR p.m.

Printed forms of Tender, specification, and bills of quantities may be obtained at the Office of the Board, Norfolk House, Norfolk-street, Strand, W.C., on payment of a deposit of Five Pounds (gold or Bank of England note), which will be returned to persons sending in a bona-fide Tender accompanied by the sealed bills of quantities.

Sealed Tenders are to be delivered at the Office of the Board, endorsed "Tender for Works, Northern Hospital," not later than TEN o'clock a.m. on WEDNESDAY, the 17th MARCH, 1897.

The Managers do not bind themselves to accept the lowest or any Tender.

By order,

T. DUNCOMBE MANN,  
Clerk to the Board.

Norfolk House,  
Norfolk-street, Strand, W.C.  
Feb. 23rd, 1897.

**THE PARK FOUNDRY CO. invite TENDERS**

for the General Contractor's Work in the erection of New Moulding and Fitting Shops, covering nearly 1½ acres (with the exception of the iron work to roof), to be erected on the Derby-road, Belper. Drawings and Specifications may be seen and Bills of Quantities obtained with Forms of Tender on payment of the sum of £2 2s., which will be returned on receipt of a bona-fide Tender and the Quantities (not necessarily filled in).

Sealed Tenders endorsed "Tender for Foundry," must be delivered to the undersigned by MARCH 13th, 1897. The lowest or any Tender not necessarily accepted.

MAURICE HUNTER, Belper.

# Surveying and Sanitary SUPPLEMENT.

MARCH 10TH, 1897.

## PLANNING OF SMALL HOUSES.

By H. V. LANCHESTER, A.R.I.B.A.

(Continued from page v.)

### No. III.—PAIR OF COTTAGES AND SEMI-DETACHED HOUSES.

THE semi-detached house is, if we except the numerous pairs of cottages scattered about the country, a comparatively modern development. It coincides, more or less, with the advent of the suburb, and the earlier

some houses of this class, did not disdain to suppress one entrance and make much of the other in order to create this illusion. It need hardly be urged that such a proceeding is both false in idea and inconvenient in practice; while in no way insisting that a pair of houses must be alike in all respects, it is obvious that when they are of a similar general character, it is absurd to enhance the importance of the one at the expense of the other. It is, perhaps, superfluous to discuss ideas so generally obsolete as these; at present the tendency is rather, if anything, in the opposite direction, and leaves room for more individualisation. Take for instance the design illustrated in plan No. 7. Here the front blocks may very well

principal entrances in juxtaposition, and consider it preferable to place them on the outer sides, as indicated in plan No. 6. I do not myself attach much importance to this, but it would be easy to arrange a pair of houses in which the plans do not repeat each other, so that the facade is not symmetrical and the entrances need not both be placed on the outer sides.

In design No. 6 it will be observed that the party-wall is built with a cavity; this should always be done where sitting-rooms abut to any considerable extent on each other, as otherwise the sound of music, and even talking, will pass freely from one house to the other, an ordinary 9in. wall being

examples may be seen in the long main roads that stretch in straight lines between the City and what were then isolated villages. They are more noticeable on the Surrey side, where the roads to Clapham and Brixton, Camberwell and Peckham offer many specimens of this early form. The semi-detached house of this period did not, however, differ so much from the more usual terrace type as to render it especially interesting. The succeeding efforts are, if anything, less in consonance with present ideas, as they principally consisted in various schemes to make the two houses appear as one. Even Sir Charles Barry, in designs for

be somewhat varied in detail, and the general effect would be that of two detached houses of different design.

As a general rule, in planning semi-detached houses it will be found that the kitchen offices must be placed on the outside, so as to avoid the necessity for any traffic to and from them passing the windows of the sitting-room that overlooks the garden. The only exception to this is in the unusual case of the tradesmen's entrance being from the end of the garden, when the kitchens to the two houses will be best placed side by side next the party wall. Some object to placing the

quite inadequate to prevent this taking place.

The frontages given in each case represent the minimum ones on which the designs could be built; in all cases a somewhat more liberal allowance would be desirable.

No. 5 represents a pair of cottages of varied plan, and introduces the cranked dividing-wall, which in this case enables the bedrooms to be better proportioned and more economically arranged. This scheme of carrying the party-wall in an indirect line was effectively utilised by the late E. J. Tarver in his plans for houses at Telford Park, but of course it

NO 6 - SEMI-DETACHED HOUSE

CUBE AT 12 = £90

can only be done in cases where large blocks of ground are being covered by one builder.

The other designs seem to call for few notes beyond the points already referred to. No. 6 would undoubtedly be improved if increased a few feet in width, and No. 7 is to be preferred if the outlook or aspect at the back is in a marked degree superior to that in the front.

### SANITARY SCIENCE.\*

BY PAUL OGDEN.

IN this, the first of a series of short articles, all that relates to drainage, water supply, and ventilation will be briefly considered. That part of the subject which, to my mind, is the most important—the arrangement of conveniences and their connection with the drainage—will be treated in detail. This branch of an Architect's business is the most exacting. Almost daily new difficulties arise, new theories are advanced, and new suggestions are made in an endeavour to effect a solution of all the complex questions of Sanitary Science. We must have lavatories, sinks, water closets, and all modern conveniences in our buildings of to-day, and to treat these so that they shall not endanger the health of the persons daily using them, constitute the chief problems of what we call our branch of Sanitary Science. Formerly it was the custom to seal up all the ends of the drains by traps, and cork up, as it were, the gases from the sewage. Although the traps are still used, the most popular system of to-day would appear to be to extract or ventilate the drainage and discharge the gases as far away and as high up as possible from channels of danger. This question of sewage disposal has attracted the attention of many engineers, and different schemes have been tried with varying success. Sewage farms have sprung up in connection with nearly all local boards and sanitary authorities, and all these authorities—or their engineers—have their own pet schemes of method of treatment. Pure air and pure water is what we require, and we cannot be healthy without them. It is difficult to obtain the former in large towns. It must, therefore, be purified as much as possible by the best known means, and, as Architects, it is our duty

to find out what the best method is! Bad air is aerial sewage, and must be purified before we can safely breathe it, just as much as foul water must be purified before it is consumed. Our corporations supply us with water practically pure, and it is our fault therefore if we do not treat it in a proper manner when delivered into our charge. The water cisterns should not be exposed to the glare of the sun, but covered in with properly fitting covers so that dust and other impurities cannot enter. After Architects and builders have finished their work, clients and all persons interested should be told that all sanitary arrangements require

almost daily inspection to secure satisfactory working.

### SEWAGE.

Vegetation feeds upon decomposed vegetable and animal matter, converting substances noxious to the life of animals into healthy vegetation when dissolved by water and taken up by the rootlets of the plants. The same vegetation, after a sufficient growth, is in its turn the food of animal life which in the process of its growth, throws off the refuse to feed vegetation again. Of the useless organic matter to be removed from houses, that which is of animal origin is destructive to the healthy life of plants, and through them to the animals which feed upon them. Before this organic matter is fit for animals it must undergo a complete change through the stages of vegetable life. Sewage is changed chemically by natural or by artificial means. If sewage is exposed to the atmospheric air, it becomes oxidised which makes it essentially harmless; this is a natural chemical action. Sewage should never be allowed to be at rest; it should always be kept moving. There are several ways of disposing of sewage—surface irrigation, sub-irrigation, and intermittent filtration, and also by settling tanks. In this last method precipitation is hastened by some chemical, and to prevent fermentation a small quantity of milk of lime is added before the sewage arrives at the tanks. Some of the chemicals destroy the sewage for agricultural purposes. Where the ground is suitable the different processes of irrigation are the best. I notice that one of the questions set in the papers for the Institute examination last year was: "Describe any good system for disposing of the sewage from a country house, other than draining it into a cesspool." Now if the land were suitable, irrigation would certainly be one of the best known systems. This may be done by drains laying to and through the nearest land, placed, if possible, about a foot below the surface, and having joints butt to butt. The drain to the land must have the joints made perfectly tight, otherwise where well water is used it might be affected. Unless sewage is discharged on the land in sufficient quantity to cause a small flow, it cannot be turned into the various directions required

NO 7 - SEMI-DETACHED HOUSE

CUBE AT 12 = £90

\* A series of short articles on "Sanitary Science," by Mr. P. Ogden, will appear in successive numbers of this journal. The question of "Ventilation" will be dealt with next week.

from time to time. To meet this difficulty, an automatic sewage regulator has been invented by Mr. Rogers Field, and made by Messrs. Bowes, Scott and Read, of Westminster. The regulator stores up in a tank the dribble of sewage, and when the tank is full it is emptied automatically through a syphon pipe, and flows on to the land in a proper stream while it does flow. Thus each tank-fall may be turned on to any part of the land requiring it, and there allowed to rest until ready again for another supply. Similar inventions have been made by J. C. Edwards, of Ruabon, and Messrs. Dalton and Co., of Lambeth.

#### WATER SUPPLY.

Provide for 16 to 20 gallons per head per day in non-manufacturing towns, and in manufacturing towns, 20 to 30 gallons per head per day. Service tanks should contain three days' supply. Cast-iron pipes, properly varnished, should be used for street mains. It is not advisable to use mains less than 3in. in internal diameter. Lead should not be used either in service-pipes or in house cisterns, though wrought iron tubes with screw joints may be used for house service. All house taps should have screw joints, so as to admit of easy repairs. In joining and fixing wrought iron service-pipes care should be taken to insert double screw joints at convenient points to allow the removal of a length of pipe for alterations and repairs. Up-bends should be avoided, or a tap should be inserted to permit of the escape of accumulated air. Wrought iron pipes are cheaper, stronger, and more easily fitted than service-pipes of lead. Certain sorts of made ground in towns act rapidly and injuriously on both lead and iron pipes; furnace ashes, waste gas, chemical refuse, old building refuse containing lime and similar materials, have a very detrimental effect. Pipes should not be laid in such material without a lining of sand or puddle, or other special protection. Earthenware pipes may be used for water conduits provided the joints are not laid under pressure. A public supply of water should not be less in volume than 20 gallons daily per head of the population. High pressure and constant service should be secured whenever practicable. Water at and below 6deg. of hardness is "soft" water; above this range water is hard. Hardness in water implies one grain of bicarbonate or sulphate of lime in each gallon of water. Each degree of hardness destroys 2½oz. of soap in 100 gallons of water used for washing. Soft water is therefore commercially of more value than hard in proportion to the worth of 5oz. of soap to each 200 gallons for each degree of hardness. But soft water is also more wholesome, and effects savings in other operations—tea-making and in generating steam power, for instance. The cistern should be of slate or galvanised iron, and in all cases should have a lead tray or safe placed under. Doulton's supply a filter, which is submerged in the cistern and charged with animal charcoal, and drawn by ascension through a syphon pipe.

THE water at Glascoed, where the service reservoirs supplying Rhyl and district are situate, was turned on through the new main pipes a few days ago. The extension has entailed a cost of £6000.

WE understand that at a recent meeting of Exeter Corporation of the Poor, a recommendation was received from the special committee that plan E for the new hospital wing, prepared by the Surveyor, should be adopted, together with the end portions of plan B, and that the Surveyor be requested to supply new plans for a tramp ward. The report was adopted.

BRETHERTON'S buildings, in North John Street, Liverpool, were perhaps the first of any Architectural pretensions designed in Liverpool for commercial as distinguished from public purposes. Recently the Royal Insurance Company acquired a large block of property, extending from their existing offices to a narrow street lower down. They intend to demolish these premises, and to erect on the site a large structure for the purposes of their business.

## Surveying and Sanitary Notes.

At the Sanitary Institute examination, held at the Technical Institute, Swansea, thirty candidates presented themselves for examination, twenty-one of whom were successful.

THE Health Committee of the Liverpool Corporation, on the recommendation of the medical officer, Dr. E. W. Hope, has decided to appoint two lady inspectors in the sanitary department. They are to be principally engaged in house to house visitation in the poorer neighbourhoods. The innovation is anticipated with much interest. Two additional male inspectors are also to be appointed.

THE Dewsbury and Heckmondwike Waterworks Board has declined, in the interests of manufacturers, to do anything to harden the water, and thus render it non-absorbent of lead. Under those circumstances the Corporation has authorised a request that iron or tin-lined water pipes should be specified for new buildings. If this be necessary for new buildings, it seems only reasonable to suppose that something ought to be done with regard to old buildings.

A CORRESPONDENT writes:—"I shall be glad if you will call attention to the numerous rain-water channels in courts and across pavements which are choked up with filth and dirt in the City, and must be very detrimental to health. Apparently they are very rarely flushed out. I complained to one owner of a court, but he said it was not his business to clean out the channel, and, in reply to my inquiry, he suggested that it was the duty of the Commissioners of Sewers to do so."

MR. ROBERT JOHN HUGHES, District Sanitary Inspector, Liverpool, has been unanimously selected from over eighty applicants for the office of Inspector of Nuisances to the Rhyl Urban District Council, at a commencing salary of £120. In addition to a long practical experience, Mr. Hughes holds a number of important certificates in building construction, sanitation, drawing and allied subjects; and in his position as Hon. Librarian to the North-Western Sanitary Inspectors' Association, has evidenced an intelligent interest in the advancement of his profession. Mr. Hughes entered upon his new duties on March 1st, with the good wishes of all his Liverpool colleagues.

At a recent meeting of the Commons Preservation Society, the contemplated interference with common land by numerous private Bills now before Parliament was taken into consideration. Included in these Bills is that promoted by the Midland and Great Northern Railways Joint Committee, by which it is proposed to take ten acres of Southtown Common, near Yarmouth, and also to run a railway over the beautiful and extensive open space known as Dunton Denes, which is much used for recreation by the inhabitants of the locality. The Denes would be practically bisected, and unquestionably ruined, should the scheme be carried into effect. It was unanimously felt by the Committee that any interference with the land should be most strenuously opposed by the Society, and it was decided to secure the blocking of the Bill on second reading in the House of Commons. It was also decided to vigorously oppose the Christchurch Inclosure Allotments Bill, promoted by the Attorney-General. Under the Christchurch Inclosure Act, 1802, a large area of land was set out as a turf fuel allotment, and rights of turbary are freely exercised over it by many of the occupiers of small cottages in the district. Power is now sought to extinguish those rights and to sell 325 acres of allotment.

At a recent meeting of the Melton Mowbray Rural District Council it was stated that the Local Government Board had authorised the

Council to borrow £300 for sewerage improvements at Somerby, and it was decided that Mr. C. Ogden, surveyor, Leicester, be instructed to prepare specifications and obtain tenders for carrying out the work.

At a recent meeting of the Beccles Town Council, a memorial signed by 104 ratepayers and burgesses was brought forward, asking the Council to give effect to the general feeling "that the appointment to the surveyorship should be revoked, on the ground that Mr. T. W. Woodroffe was entirely without experience of the work; that, in the important works proposed to be carried out, it was most desirable that the Borough Surveyor should be competent and experienced in sewerage, sanitary, and drainage works, and that it was opposed to the public interest that this important office should be filled by a novice." The Council, however, declined to consider the memorial.

An enquiry was recently held at Yarmouth by Colonel A. G. Durnford, R.E., with reference to the proposed expenditure by the Town Council of £10,500, on the erection of a refuse destructor on the Corporation marshes, between Caister Road and the River Bure. The Borough Surveyor explained that the Corporation had previously applied for a loan of £8000, to erect a destructor near the Workhouse and Isolation Hospital, but the Local Government Board declined to sanction this site. Now it was proposed to set it up on a marsh between Caister Road, the main road into the town, and the River Bure. This, in the opinion of the Council, was the best site possible under the circumstances.

At a recent meeting of the Streets and Sewerage Committee of the Leeds Corporation, Mr. Appleton (Chairman), presiding, it was resolved to accept the tender of Mr. Isaac Gould, of Leeds, for the construction at Knostrop of a number of settling tanks. The effect of this will be to double the existing accommodation and to largely satisfy the requirements of the West Riding Rivers Board. By the terms of the contract, a heavy penalty is to be imposed in case the work is not completed within twelve months. The amount of the tender was £27,991. At the same meeting the City Engineer (Mr. Hewson) submitted a plan for the completion of the Hunslet rainfall sewer, of which the committee approved. It will now be laid before the directors of the Aire and Calder Navigation for sanction.

A CORRESPONDENT at Venice, says:—"As the public already knows, the sittings of the Sanitary Conference are conducted with closed doors. The reason for this is not to keep its conclusions secret, but rather the discussion by means of which the conclusions are arrived at. It is impossible that in an International Conference differences should not arise. National interests do conflict, and national jealousies are apt to be felt. England, with its enlightened views on sanitation, and its vast commercial interests, is naturally desirous of imposing the minimum restriction on traffic consistent with avoiding danger from the plague, and desires to keep open the great land and water highways of the world, especially that of the Suez Canal. On the other hand, some nations, back many decades in their knowledge of sanitary principles, and having little at stake in the carrying trade of the world, would go to any extent in repressive measures with a view to preventing the spread of diseases now prevalent in the East. At the Conference, I may say this, the views of England are steadily gaining ground. Besides, Dr. E. Thorne Thorne, of the Local Government Board Medical Department, and Surgeon-Colonel J. Richardson, of the Indian army, Dr. Cleghorn has just come direct from Bombay. The delegates are working very hard. They sit in the forenoon now as well as in the afternoon, and often for four hours at a time. The discussions are conducted in French, and the delegates communicate the decisions of each day to their respective Governments in cipher telegrams.

THE ceremony of cutting the first sod of the new storage reservoir to supply Larne, which is being constructed at an estimated cost of £5000, was performed on the 1st inst.

THE Glasgow Corporation Sewage Committee has appointed a sub-committee to consider the disposal of the sewage on the south side of the Clyde with the view of promoting a bill in Parliament next session to secure compulsory powers.

At a recent meeting of the Falkirk Town Council, the Clerk read the minutes of meeting of the Sanitary Committee, from which it appeared that reports by Mr. W. Black, Architect, and Mr. Neilson, sanitary Inspector, were read as to the proposed erection of model lodging-houses by the Council in East Bridge Street, and a motion that the provision of lodging-houses be adopted and proceeded with without further delay was carried. The Committee's recommendation was approved of.

At Luddendenfoot, Major-General Crozier, Inspector of the Local Government Board, held an inquiry into the application of the District Councils of Luddendenfoot, Warley, and Midgeley for a provisional order for power to compulsorily acquire under the Lands Clauses Act, land for a joint sewage scheme for the districts. The land sought to be acquired is twenty-six acres in extent, known as High Royd Farm, belonging mainly to the Halifax Infirmary and the Sowerby Bridge Parish Church. On this it is proposed to construct a system of settling tanks and land filtration, and then pass the effluent into the becks.

THE General Purpose Committee of the Isle of Wight County Council recently held an inquiry respecting the application of the East Cowes Council to enlarge their district. It appeared that the District Council wished an extension of the boundary in order to close the road between the two lodge gates at Osborne as desired by the Queen, and it was stated that the District Council had declined an offer of £2000 from Her Majesty, who subsequently, through her solicitors, suggested as an equivalent, a gift of land adjacent to the district, and to make a new road from East Cowes to Whippingham, so as to shorten the distance to the Church.

For a number of years the question of sewage disposal has been a difficulty with successive Yeovil Corporations, a fact accounted for by the sewage being of the foulest in the kingdom, attributable to the nature of the industries of the town. Considering that the treatment of sewage generally has, at the best, advanced scarcely beyond the experimental stage, it need occasion no surprise that Yeovil, in common with many other towns, with but few of the tremendous drawbacks there experienced, has been unable to steer clear of the operations of the Pollution of Rivers Act. Works for the carrying out of the experiments have been provided, and a portion of the town sewage is being treated there daily. The works, constructed at a cost of about £450, are equal to dealing with the sewage of a population of 500—an outlay of about £1 per head. The population of Yeovil is a rapidly increasing one, at present approaching 10,000; supposing, therefore, that the septic tank system is ultimately adopted as the method of disposal of the domestic sewage of the town as well as the refuse from the manufacturing, the ratepayers will have to face an outlay which may be calculated at between £10,000 and £15,000.

At a meeting of the Dublin Sanitary Association on the 25th ult., the question of hospital accommodation in Dublin was before the Council, and after considerable discussion the following resolution was adopted:—"That the Council beg to call the attention of the Corporation as the Sanitary Authority of

the City of Dublin to the want during the present epidemics of additional hospital accommodation for the treatment of infectious cases. That the Council of the Dublin Sanitary Association are of opinion that in order to relieve the congested wards of the Dublin hospitals of patients in the convalescent stage of the prevailing epidemics, the Sanitary Authority of Dublin should be urged to represent to the respective Dublin Boards of Guardians the necessity of adequate accommodation for such convalescents being provided."

At a recent meeting of the Public Works Committee of the Birmingham Corporation, the subject of the "Rotten Row" scheme, so far as it concerned the committee, was brought forward for consideration. Lord Calthorpe made an offer to present to the city a straight strip of land, about a third of a mile in length and thirty yards wide, running from Edgbaston Road the full length of the west side of Cannon Hill Park, for the purposes of a "Rotten Row." The offer was accompanied by the conditions that, in addition to constructing the "Row," the City Council should fill up the old millstream which runs in a zigzag direction across his lordship's land to the small bridge near Pershore Road, that the bridge across that watercourse should be abandoned, that Edgbaston Road should be widened and the bridge near the park gates replaced by a new one, and that the Council should also straighten the River Rea from Edgbaston Road to Calthorpe Park. The City Surveyor has laid before the Public Works Committee plans and estimates of the undertaking with respect to the straightening of the river, the making of the new road, and the construction of the bridges. The committee has discussed the scheme—which would be a great improvement, if an expensive one—at some length, and resolved to confer with the Baths and Parks Committee on the whole subject.

THE following report of the committee appointed to inquire into and report on the West Carr drain and the other drains of the town has been presented to the Retford Town Council.—The committee, as authorised by the Council, has consulted an engineer, Mr. J. C. Melliss, of Gresham House, Old Broad Street, London, on the subject of the sewage of the town. They are advised by him that a modern system of drainage, which will enable the sewage of the town to be diverted from the several streams and watercourses intersecting the town, is very greatly needed. Mr. Melliss recommends the construction of a modern system of pipe sewers throughout the town for the conveyance of the sewage proper, and a limited quantity of surface water, the remainder of the surface water being dealt with by a separate system of drains, for which the present sewers can to a great extent be utilised; the sewage by means of these pipe-sewers to gravitate to the Market Square, which is almost the lowest part of the town, and he thinks that with one exception this can be done without the employment of intermediate lifts. The exception to which he refers is the village of Ordsall, and he is of opinion that if it should be found necessary to lift the small quantity of sewage at that point it could be easily done by some simple means, such as a small hydraulic pump. From the Market Square, Mr. Melliss proposes the construction of an outfall sewer along Churchgate, Moorgate, and Bolham Lane to Bolham, so that the sewage would by these means gravitate to this point. The sewage would then have to be lifted to the higher land above Bolham Mills, and Mr. Melliss proposes to employ compressed air as the means of so doing. When lifting, the sewage will have to be dealt with either by broad irrigation or by precipitation and filtration. Mr. Melliss is of opinion that the land suitable for broad irrigation would not be sufficient for more than ten or twelve years, and therefore that precipitation and filtration should be adopted. For this purpose he recommended the purchase of an area of about 30 acres of the high land, which he is of opinion will suffice for

all future requirements. Mr. Melliss, when asked as to the probable cost of carrying out such a system of sewerage, replied that it was impossible for him to estimate the cost without preparing a detailed scheme for working out his proposal, and puts the cost of preparing such a scheme, together with a reliable estimate of the cost of carrying the same out at £50, this sum to merge in his general commission if he should be hereafter employed to carry out the scheme. The committee asks the sanction of the Council to its employing Mr. Melliss to prepare such a scheme and estimate.—The report was adopted.

THE Sanitary Committee of the Dundee Town Council continues to push on with vigour its crusade against insanitary buildings in all quarters of the city. There is not a single "slum" region which has not by this time felt the beneficent influence of its operations, and it is expected that before long every property which a year or two ago would have been described by the opprobrious epithet of "slum" will have been either renovated, rebuilt, or removed altogether. At present the Sanitary Committee is carrying on its operations in such quarters as the Bog, Lochee, Scouringburn, Greenmarket, Ann Street and Wellington Street, King Street, James Street, West Port, Miller's Wynd, Todburn Lane, Wallace's Pond, Hawkhill, Johnston's Lane, and Vault, where they are insisting upon the proprietors of all insanitary buildings rendering the properties fit for human habitation, and conformable to the rules of modern sanitation.

At a special meeting of a sub-committee of the Aberdeen Town Council, held for the purpose of considering the remit on the question of public baths, sketch plans were submitted from the borough surveyor's department of three schemes. The first and most expensive of the schemes was for the erection of baths on the vacant piece of ground between Schoolhill Railway Station and the Free South Church. In the plan a large building with a handsome frontage is shown. In the ground floor are four shops, and the first floor would be let for offices, while the baths are on the second floor, with entrance from Rosemount Viaduct. There would be two large swimming baths, Turkish baths, and fifty-five first and second-class slipper baths. The estimated cost of the building, apart from the site, is £23,000, and the feu-duty would be about £75 per annum. The site of the second of the schemes put forward is in the vicinity of George Street, lying between that thoroughfare and Causeway End. At this site the accommodation is almost similar to that proposed in the Viaduct, but the estimated cost is considerably less, viz., £20,400. The feu-duty, however, would be from £90 to £100 per annum. The third site is in the vicinity of Loch Street, and the building is somewhat similar to the second one. In this case the estimate is £19,000, and the yearly feu-duty would be about £100. In each case it is expected that the revenue to be derived from shops and offices would amount to at least £400 per annum, which would pay the interest on £13,000 of the money to be borrowed for the erection of the baths, leaving interest on only £10,000 to be met from the drawings from the baths, which it was declared would be more than sufficient to cover working expenses besides. The Schoolhill site was approved of, and the matter goes forward to the Council for approval.

THE construction of the new French Transatlantic cable, which is to be laid during the ensuing summer from Brest to New York, is rapidly approaching completion. It will have a length of 3250 nautical miles.

WHILE a number of workmen were engaged strengthening an old brick railway bridge over the Sencil Drain at Lincoln, the centre arch collapsed, and twelve men were thrown into the stream. All were speedily rescued. The bridge is to be replaced by a girder one, and traffic will not be seriously impeded.

### Proposed New Buildings for the L.C.C.

THE House of Commons, with a majority of eighty-one on the vote, has cast forth the "London County Buildings Bill," and the Council has now to turn itself to some more economic and less aspiring scheme, and satisfy itself with a less ambitious site than that in Trafalgar Square. It is worthy of note that the Bill was originally known as "The London County Hall Bill," and we can only suppose that the title under which it was presented to the House was substituted as being more convenient to the ear, and in

such exaggerations and extravagance of hyperbole in its support must be very far to seek. Setting aside the Imperial and Constitutional sides of the question, we must still find that the representatives of the Council made a very sorry show on this occasion of the debate on the Second Reading of their Bill. All the figures quoted in support of the motion were subsequently shown to be manifestly understated, and the facts that were to support the theory that the selection of the Trafalgar site was an inevitable conclusion, a sort of decree of fate, were not fairly presented, or were distorted in their bearing on the question. These two points, however, are established. First, that the Council is in immediate want of extra accommodation for some 500 clerks, and a supplementary series of committee and other public and executive chambers incidental to the work of the Council. Secondly, that the vote of the Council in sanction of the Bill was not a party vote. It was no case of a "Progressive" majority, and a "Moderate" minority. Mr. Whitmore's estimate, "arrived at by a responsible expert," of £800,000 for the

of Cockspur Street with Charing Cross, whilst being probably the most expensive in London, if we except the site of the Bank of England, is also unsuitable Architecturally, in that its irregularity restricts the plan and affords no opportunity for raising a building of that dignity and importance which the Council indicates. In this connection a strange inconsistency of view was advertised by two of the representatives of the Council. Whilst Sir John Lubbock urged the acceptance of the Bill primarily because the alterations in the locality of the site, occasioned by the new street, would enable the Council to raise a building adjacent to, and in Architectural unison with, the Government offices now building on Whitehall Parade, Mr. Whitmore's emphasis was centred on the desirability of a building that would lighten the burden of the long-suffering ratepayers by letting its ground floor out as shops. It may not require an exorbitant scale of merit and qualification in Architectural taste and experience to build, not inadequately, beside a modern Government office; but to raise in addition at the same time upon such a site a

WESTWOOD HOUSE, SYDENHAM. JOHN L. PEARSON, R.A., ARCHITECT.

particular to the ear of those Conservative members who, according to the mover of the second reading, are charged with such a stoic attitude of aversion to the Council as would find expression in "Oh, bother the County Council and all its works," and who smell a Municipal "Palace" in every suggested increase of the Council's executive accommodation. This judicious picking of terms no doubt contributed to the disaster of the occasion, for the action of the House of Commons in over-ruling the expert testimony which the Council brought to substantiate and palliate its claim, implies a want of confidence—nay, an actual disbelief in the Council's sincerity and good faith. This may well be attributed to youthful transgressions of the Council in the past; but however ready the House of Commons might have been to accept the statements of Mr. Whitmore and Sir John Lubbock, the violent affirmations of Mr. John Burns would alone, and at once, have awakened its suspicion and distrust. The plausibility of any motion that should call for

acquisition of the site, reducible to £500,000 by the letting of the ground floor of the proposed building, for which he allowed £500,000, leaves the whole cost of the complete scheme at £1,000,000 sterling. It has, however, transpired that no plans have actually been prepared, and no details of the building settled, so that the Architect's estimate of the cost of the building is a loose and widely conjectural estimate. Further, it is exceedingly doubtful whether the site, which measures 84,000ft., would be covered by a building of the character suggested for £500,000. The site is remarkable for the length of its street frontage; and the present building consists among others of an important bank and assurance and steamship offices. Mr. Bartley stated confidently that the projected building would cost the Council at least £2,000,000, while Sir Blundel Maple said it could not amount to less than £2,500,000, at completion, and these figures were not challenged by subsequent speakers. This site, too, on the angle

dignified *Hotel de Ville*, above the orthodox plate-glass of haberdashers, tourist agents, and gas engine depôts, and yet escape perpetrating an own twin brother to the Grand Hotel over the way, is a task quite beyond the powers of the human Architect as revealed to us by history and personal experience. Mr. John Burns, on the occasion of this same debate, in picking objections to the various other sites at the disposal of the Council, referred to a particular site on the Embankment as not affording such a sound foundation as would assure a building capable of lasting two or three hundred years. This must seem palpable nonsense when we consider that it is the Embankment and St. James's Park (where the subsoil is equally treacherous) that are remarkable for the loftiest, costliest, and most important buildings in London. Surely the Hotel Cecil and the Houses of Parliament answer this objection. It is the ordinary, and not an extraordinary thing as Mr. Burns seems to think, to raise buildings in these localities on a raft, and a thick bed of

concrete over the whole site is the most usual way of constructing it. It is also to be noticed that the County Council has but lately sprung into existence, and that it is developing and modifying with each year. To raise a costly building for the use of an executive body which, in its present constitution, may prove but ephemeral of our present day, is premature, and indeed unjustifiable. Even now there is a strong tendency to reorganisation and decentralisation of the Council, and a devolution of its powers to local authorities. Until it may be seen how far these developments will proceed, and to what they will ultimately lead, the Bill should lie in abeyance. There is, we think, a practical reason for such an action. In the course of some few years a wide street is to be made in the neighbourhood of the Strand. On that occasion the Council will have an opportunity of acquiring cheaply a selected site that will afford it an unfettered plan, and possibilities of dignified Architectural treatment of the elevations of its "county buildings." Let the London County Council continue with its makeshift as heretofore, until its exact powers and functions are definitely settled, and this opportunity for a site arises.

### NOTICE.

#### The Architectural Review Academy Number.

THE EDITOR OF THE ARCHITECTURAL REVIEW will be glad to receive drawings intended for the Royal Academy for publication in the Academy Number. Drawings should reach this office at the earliest moment, with a notification as to whether they are to be returned to owners or sent direct to Burlington House.

#### HERALDRY IN ENGLISH MEDIAEVAL ARCHITECTURE.\*

W. H. ST. JOHN HOPE.

MR. ST. JOHN HOPE said he should confine himself to the historical period beginning with the accession of Henry III. in 1216, and ending with the death of Henry VIII. in 1547. The applications of heraldry to Architecture in this period were so numerous that it was not easy to deal with them in any degree of connection. Arms, badges, crests, and supporters were freely used in every conceivable way, and on every reasonable place. Whether the building were ecclesiastical, domestic, or secular was immaterial: there was no difference in the treatment of the heraldry nor limitation of its use. The earliest applications of armorial insignia were purely of a personal character, to distinguish a man from his fellows when all were alike disguised in their war harness. These insignia usually took the form of a device painted upon the wearer's shield or attached to his headpiece. Heraldry, consequently, is met with first in buildings in the form of painted or sculptured shields on the

#### MONUMENTAL EFFIGIES OF DEPARTED WARRIORS.

The value of armorial shields as a mode of picture-writing soon suggested itself when heraldry became a science, and the association of them with Architecture formed at once a beautiful form of decoration and a speaking historical record. The wall arcades of the nave aisles, and the tombs of Queen Eleanor and William de Valence, in the Abbey Church of Westminster, furnish the earliest and most charming examples of this combination. Another admirable thirteenth century example is the gatehouse of Kirkham Priory, Yorkshire. In the new nave of York Minster, of about the same period, various benefactors to the

Church are commemorated, after the Westminster fashion, by their shields of arms, thirty-two in all, sculptured, two to a bay, in the spandrels of the pier arches. A somewhat similar arrangement occurs at St. Albans in the beautiful decorated bays of the nave, built after the partial fall of the south side in 1323. In the North of England there were numerous fourteenth century buildings showing heraldic decoration with the Architecture—for instance, Bothal Castle, Alnwick Castle, Hilton Castle, Co. Durham, Lumley Castle, the Lion Tower at Warkworth, and Micklegate Bar, York. The presbytery and quire of York Minster contain in the spandrels of the pier arches a series of sculptured shields similar to those in the nave, and the great arches of the central lantern tower are also adorned with large and fine examples of the sculptured shields of arms of the builders and others. Taken as a whole, the fourteenth century, except perhaps in Yorkshire, was not very prolific in buildings decorated with heraldry; but it produced

#### A MAGNIFICENT SERIES OF MONUMENTS,

many of so elaborate a character as to form distinct features of the Churches wherein they stand. The more notable examples were enumerated and illustrated by the author of the paper. The so-called Perpendicular Style was very prolific in heraldic ornament and decoration, which was especially seen in East Anglia, where almost every large Church of the period is lavishly decorated with heraldry. Several examples were described. Fine displays of heraldry existed in many of the ornate fireplaces of the fifteenth century, notably at Tattershall, in Lincolnshire, and the bishop's palace at Exeter. The fifteenth century, like the fourteenth, was rich in heraldic monuments, and brought into fashion those beautiful stone structures that combine the monument with the chantry chapel, of which examples exist at Tewkesbury, St. Albans, Salisbury, Winchester, and elsewhere; one of the finest in design, as it is most remarkable in construction, being the bridge-like structure in Westminster Abbey Church, in memory of Henry V., whose tomb stands beneath it. Much of the Architectural heraldry of the first part of the sixteenth century is simply a continuation of that which preceded it. In large and costly buildings, however, the increased richness of the Architecture was accompanied by a corresponding

#### OUTBURST OF HERALDIC DISPLAY,

as in Henry VII.'s Chapel at Westminster (in particular the bronze doors); King's College Chapel, Cambridge; St. George's Chapel, Windsor; and Hampton Court. Selecting a few typical Architectural features, such as spandrels, bosses of vaults, &c., Mr. Hope proceeded to show the influence the introduction of heraldry had had upon their ultimate development, citing numerous existing examples. In conclusion, the author discussed, by the light of mediæval examples, the artistic treatment of heraldry in its application to Architecture—shields, crests, supporters, and various other features being dealt with in detail. The lecture was illustrated by a large number of lantern slides and coloured photographs of stall-plates of Knights of the Order of the Garter in St. George's Chapel at Windsor. The discussion was unusually brief. It was opened by Mr. J. A. Gotch, who, in proposing a vote of thanks to Mr. Hope, confessed that the latter-day examples of heraldry which had been presented on the screen pleased him more than those of earlier times, although the latter were of course the purest. Coarseness, and an ill-arrangement of scale were noticeable in detail in one or two examples, and such slight defects they welcomed with pleasure, for they encouraged rather than discouraged latter-day disciples. The series of examples which Mr. Hope had brought forward emphasised one thing—the advantage of studying heraldry in the round as well as in the flat, for by having to model a shield and not merely to draw it, they became better acquainted with its construction and how the various things which the shield bore were logically placed one in another. But apart

altogether from etherial and artistic considerations, heraldry was most valuable on account of the amount of light it threw upon history. Often the only clue one had of the history of a building laid in the shields with which the building was adorned, and heraldry therefore appealed to Architects with especial force.—Mr. J. J. Stevenson seconded the vote of thanks, and maintained that heraldry was merely a picturesque way of writing one's name on buildings; it belonged to the same order of things as public-house signs, which were meant as intelligent tokens to those who were unable to read. He believed that heraldic devices ought to be adhered to by those who had the right to use a crest, and he further believed that it ought to be a modern, practical thing.—Mr. Hugh Stannus thought it was a matter of duty on the part of the descendant of an old family to adhere to the heraldic device of the family, and as to the modern objection on the ground of the disuse of the helmet now-a-days, why the whole thing was merely a conventional method of stating a fact, and if they put the arms on a shield, he saw no reason why they should not put a crest on a helmet. They could look at this subject from two points of view. Firstly, heraldry was intended to tell a story as to who the person was who lived in a house or who the builder of that house was; secondly they could consider heraldry as a decoration. There were certain decorative principles involved, and although they wanted to tell a story, they wanted to do it in an artistic manner. Therefore it seemed to him that heraldry now-a-days, in connection with Architecture, was subject to the same law as Architecture, and required that a shield should have some sense of surface, and so forth. He regretted to hear Mr. Gotch descry modern heraldry, for he (the speaker) believed Mr. John Clayton, Mr. T. R. Smith, and a few others had produced heraldic devices quite as fine as those of earlier times, though it was, of course, from these earlier examples that they had taken their keynote. Nevertheless, if they studied these old examples they might hope to emulate, if not to equal them.—Mr. J. D. Grace remarked that the examples shown by Mr. Hope exhibited a very thorough knowledge of the general principles of heraldry, and of the meaning of the various insignia. Freedom was a very dangerous thing to adopt by those who had not gone through the mill; they saw it exemplified in Art every day, and it was for them to guard against such a fault. The speaker proceeded to favour modern heraldry, and made reference to a very fine example to be found in the Houses of Parliament.—Mr. Aston Webb (who occupied the chair in the absence of Professor G. Aitchison, A.R.A.) said they as Architects were fully alive to the question of heraldry in conjunction with their own Art, and they recognised very fully that the poetry and history of our buildings must always, in points of detail at any rate, largely depend upon the way in which heraldic devices were introduced. They recognised the value of the panel over the gateway of the small almshouses just as well as they recognised the magnificent result in the great castle or Church, and he was happy to think they could point to several very fine modern examples.—The vote of thanks to Mr. Hope was cordially carried and briefly acknowledged.

At Keighley the Board of Guardians are considering the necessity of providing a new Workhouse.

THE St. Olave Board of Guardians has decided to purchase the land and premises known as Slaygrove Farm, Ladywell, consisting of nearly 35 acres, as a site for a new workhouse, the cost of which is estimated at £180,000.

EXTENSIVEREDECORATING work has been carried on at Windsor Castle, both in the private apartments, and in the "State" portion of the Palace, for every available room will be required this summer for the accommodation of Imperial and Royal guests and their suites. The work will be completed while the Queen is abroad.

## Perspective in Every-Day Practice.

By WM. N. CUMMING, A.R.I.B.A.

### PART II.—“DOUBLE VANISH INTERIOR PERSPECTIVE.”

THE term “Double Vanish Interior Perspective” may be a little misleading, as it might imply that the method of dealing with an interior (which I am about to describe) is limited to the use of but two vanishing points, but it seemed the only way by which I could distinguish between two methods of treatment, viz., parallel perspective having one main vanishing point, and that other method in which we have two. Accidental vanishing points may occur in both cases, and I do not wish the student to be misled, and to imagine that in the one case

be in with regard to the object and station point, or point of sight, and if it is desired that we should work to the scale of 4ft. to one inch, the plan must be drawn to that scale, and all heights on the height lines laid down to the same scale.

In Fig. 2 will be seen the method of putting the box into perspective, showing the various height lines, position of vanishing points, &c., and it will be noted that this method gives a more living representation of the interior of the box than the same object drawn in parallel perspective. The plan is to the scale of 8ft. to one inch.

Fig. 3 shows the box with the picture plane placed behind the object in order to increase the size of the picture, and also serves to illustrate the use of the height line more clearly, and also the fact that the heights are set up on these lines to the same scale as that of Fig. 2, though the position of the picture plane is altered, the increased size of the picture being gained by the heights being

as the student will now be in a position to follow the diagram with ease, but I would like to draw his attention to the height lines for the various points in the picture, as I have found where it is necessary to vanish up from the height line to its respective perpendicular that one is apt to get a little confused as to which vanishing point the height should be carried. To make this clear, take the height line H L in the figure, this is the height line for the right-hand side of the room, and the position of the perpendicular for the end corner of the room is found at E on the picture plane. Mark off the height of this corner of the room and vanish up from V P I and you get the height of this corner; but it is also possible to get the height of this corner by using the other vanishing point; in this case, however, it is necessary to use a different height line, namely, that at H L 2 and proceed as before. It will help the student considerably if he keeps in mind that as a general rule all lines that tend to cross the line of direction are vanished to the distant vanishing point, and all lines tending in the same direction as the line of direction to the nearer vanishing point.

We have now got so far in our course of instruction that further progress can only be made by multiplying examples, which, though apparently presenting new difficulties in reality, only require repetition of the same processes with which we are now familiar, and as space will not permit of my giving the many examples that occur to me, I must leave the student to create them for himself. One thing, however, I would caution the student against, and that is proceeding with a perspective in what I would call a slipshod manner; everything depends upon method, and no time will be gained by rushing through any part of the drawing. Spare no pains in a careful delineation of the plan, as any little inaccuracy that may occur on plan will be magnified to a great extent when the perspective view is being set up. Also, when dealing with one portion of the design, take care that your height line for this part is denoted by some special mark on the picture, because you will find that as the perspective proceeds the lines will become multiplied, and frequently two height lines may approach each other so closely that a mistake is very easily made, and once made, is very difficult to rectify. So much so is this the case that I have seen it to be necessary to redraw the greater part of a perspective view in order to regain a hold on the particular height lines for the portion with which one is dealing.

It will be found that in interior perspective, both parallel and double vanish, that one of the vanishing points is invariably somewhere near the centre of the picture; care should be

everything must be vanished to the one vanishing point, and in the other case to either of the two vanishing points.

“Double Vanish Interior Perspective” differs from “Parallel Interior Perspective” principally in respect to the position of the picture plane and line of direction, the one of course being dependent upon the other, i.e., at right angles to the other, as we have seen. A, Fig. 1, is the object assumed to be a box with the nearest end removed as in Part I. of this article, P P the picture plane, P S the point of sight, D L line of direction, and C V centre of vision. The vanishing points are found as in exterior perspective by lines drawn parallel to the sides of the box, cutting the picture plane in the points V P 1, V P 2. It will be noted that neither of these points coincide with the centre of vision, thus differing from parallel perspective in which the vanishing point and centre of vision are one and the same thing. The position of the point of sight must be such that the extreme visual rays drawn from the picture to the point of sight do not make a greater angle than 30deg. with the line of direction; this is very important, as the distortion may be greater in double vanish perspective, should this limit be exceeded, than in parallel perspective. As a rule it will be found that the one vanishing point is at a much greater distance than the other, so much so indeed that it will almost be necessary in every case to employ the centrolineal or guiding lath for lines vanishing to this point. It will be necessary to employ height lines for both sides of the object, as it is evident from the position of the picture plane that we cannot put up a section of the object as we did in parallel perspective, thus losing one of the advantages accruing to that method of treatment of the subject, but we can, with care in using the proper height lines, produce a perspective with almost as great accuracy. Also it will not be possible for us to increase the scale of the picture so that we can apply that increased scale to the required heights, unless the plan is drawn to the large scale; for instance, assuming that our plan is drawn to the scale of 8ft. to one inch, we must adhere to this scale in working off our heights on the several height lines, whatever position the picture plane may

vanished up from instead of down to the several perpendiculars to which they refer. The one objection to this is that as the heights are all drawn to the scale of 8ft. to lin., greater accuracy is required in laying down these heights on the paper, especially if one is dealing with minute detail, such as the members of a cornice, and I believe it to be better, where possible, to draw the plan to the enlarged scale, and placing the picture plane between the object and eye to vanish down, as in so doing one ensures greater accuracy.

Fig. 4 is an example similar to that given in the first part of this article, viz., a small hall, and I have drawn the plan and section to the scale of 8ft. to lin., placing the picture plane behind the object in order that the

student may be able to follow the application of the various height lines, &c. It will not be necessary for me to explain the preliminary processes, such as finding vanishing points, &c.,

taken that this does not become a large and unsightly hole caused by, for instance, a loose or springy needle or pin being used for this point. I would, therefore, advise that a needle

FIGURE 1.

FIGURE 2.

FIGURE 3.

## FRENCH FEUDAL CASTLES.

of medium thickness be used, and that it be driven well down into the board, so that the head projects only sufficient distance to allow of the straight edge catching against it; this will prevent wobbling and also enlargement of the hole, and when the perspective is complete may be withdrawn, leaving but little trace of its existence, any mark left being easily removed by turning the drawing on its face and rubbing the back of the prick hole with the finger nail or some hard instrument such as an ivory sector, this will restore the disturbed tissue of the paper, and the small hole made by the needle will be found to be almost invisible.

Once the student has grasped a knowledge of Theoretical Perspective, he will find that it assists him materially in many branches of the Profession. Difficulties frequently occur when sketching a building due to the tendency to shift the position of the eye in order to see the detail of certain portions of the building more clearly, and a knowledge of the laws that govern perspective will enable the student to automatically direct the perspective of the several portions of the building at which he is looking, thus producing a perspective sketch of the building having the vanishing lines of its various features in harmony. It will also help the student to better understand Design and Construction, enabling him to imagine his work in perspective and also to sketch with ease any portion of his design or construction which may not be clear in the geometrical drawing.

Before closing this article, I would urge the student to first master the general principles of perspective, and, having done so, to devote his attention to the Artistic treatment of the subject, not only for his own edification, but also that a well-drawn perspective goes far towards inducing one's client to be more liberal in his expenditure on the work with which he entrusts his Architect, and that many a good job has been gained by a well-executed perspective of a design catching the eye of a prospective client on the walls of the Academy.

In conclusion, I have not touched on the projection of shadows and reflections in perspective much used by French Architects in the delineation of their buildings, and must leave the treatment of this subject to some future occasion, as I feel that it were better that the student should digest what I have already written before he plunges into the intricacies of sinography, &c.

I hope that the few simple rules that I have given may tend to interest the student and encourage him to further study, and that I have helped to dispel the idea that the study of perspective demands a supernatural amount of brain-power in order to master its intricacies, as one would be led to suppose by the majority of works on the subject.

That of Etampes is in the form of a quatre-foil, Provins is octagonal, Chateau Gaillard and La Roche Guyon are pear-shaped, Beaucaille is triangular, Issoudun semi-circular, while Bonaguil takes the curious, and, as far as we know, unique, shape of a ship or a flat-iron. The most usual form of the early feudal keeps was rectangular, and it was not till the reign of Phillip Augustus, at the end of the twelfth and beginning of the thirteenth centuries, that, as the corners lent themselves too readily to the operations of the sapper and miner, the round form was adopted in preference. The donjon of Beaugency, which is rectangular in shape, dates from the eleventh century, and at the period of its erection must have been intended more for passive than active defence. At Beaugency a

## NOTABLE FEATURE

is a series of strong pilaster-like buttresses running up the face of the walls of the keep. Somewhat similar buttresses exist at Rochester, which in other points presents a considerable resemblance to Beaugency. The interior of the latter is now a mere shell, but the arrangements were probably the same as those of similar edifices of the period of its construction. The entrance was at the level of the first floor, and access to it was got by a ladder or by a small drawbridge communicating with a wooden staircase which could be destroyed in time of war. The interior would be divided by a partition wall which would either be carried up the whole height of the tower with openings at the level of the different floors, as at Rochester, or would be built solid and not taken higher than the second story, as in the Chateau d'Arques near Dieppe. The object of the latter device was,

ACCORDING TO M. VIOLLET-LE-DUC,

to constitute a double system of defence, so that if an entrance was forced into the lower part of either side of the donjon, and the occupants driven up into the third floor, they

FIGURE 4.

could be supported by the other portions of the garrison coming to their aid, and by means of this reinforcement drive back the assailants as they struggled through the narrow passages. The large mullioned window openings are insertions dating from the sixteenth century, but a few of the original narrow Norman windows remain. The keep of Beaugency is sadly fallen from its former high estate, and is now used as a store for firewood, access to it being obtained by a doorway cut through the wall of the ground story. Closely adjacent are the buildings of a later Chateau, erected about 1440 by the famous Dunois. These are

#### GOOD EXAMPLES

of French fifteenth century Architecture. The later Chateau was frequently the residence of Royal personages, and was also for a time occupied by Henriette d'Entragues, one of the mistresses of Henry IV. At present the buildings are used as a *depot de mendicité*. The Architectural interest of Beaugency does not, however, end with the Chateau. In the immediate vicinity of the latter is the fine

its exterior, extremely plain and simple, its most notable features being the west and south porches. As you enter the Church by the western doorway, you cannot fail to be struck by the grandeur of the edifice, which is in the form of a patriarchal cross—that is, it has a double transept, a feature which, though not uncommon among our neighbours south of the Tweed, is almost unknown in France. The Abbey Church of Cluny, now destroyed, possessed two transepts, but, except St. Benoit, no French Church is so provided.

A SERIOUS fire recently occurred at the Cathedral of Verona. A number of sacred relics and several pictures were destroyed. The damage is estimated at about 15,000 francs.

The statue of Alexandre Dumas is to be erected in Paris on the square near that of his father. The statue of another Dumas, that of the brave General of that name, is to be added, and the open space will be named Place des Trois Dumas.

#### KEYSTONES.

ABOUT 2000 houses have been destroyed by fire at Manila.

It has been found necessary to enlarge the National Schools at East Cowes at an estimated cost of £1500.

SUBSCRIPTIONS are being collected from old Etonian members of Parliament for a bust of Mr. Gladstone to be placed in the Upper School.

THE Theological College of the Presbyterian Church of England has arranged to lay the foundation stone of the buildings at Cambridge in May, to which, when completed, the College will be removed from the present premises in Bloomsbury, held on lease from the Foundling Hospital.

THE Governors of the proposed new technical school for girls at Shrewsbury have had before them an offer made by the Corporation of Shrewsbury for the sale of a site for the school of ten acres for £900. The new school is estimated to cost altogether between £6000 and £7000.

Church of Notre Dame, dating from the eleventh century, the interior of which has been spoiled by being daubed with wretched modern frescoes. It was formerly abbatial, and was burned by the Huguenots in 1567. The only other remains of the Abbey are part of the buildings of the *hospitium* and a round tower on the river bank. The curious Church of St. Etienne, built in the tenth century with a

#### TOTAL ABSENCE OF ORNAMENTATION,

and consisting of a long, narrow, aisleless nave, an apsidal choir, and a transept surrounded by a square tower, is now used as a municipal store. The Hotel de Ville dates from 1523, and is considered a *chef-d'œuvre* of elegance and harmony. The façade is profusely decorated, the mullioned windows having under them a row of sculptured panels, while over them is an ornamental balustrade. At the angles of the steep roof are *tourelles* with conical tops. In all probability the cost of the work was chiefly undertaken by the younger Dunois and his brother, the Cardinal de Longueville, and their arms appear over the doorway. The building is at present in course of restoration. The Church of St. Benoit-sur-Loire, the only remaining portion of the great Abbey of Fleury, is, in regard to

We are authorised to state that there is no foundation for the report which has lately appeared in certain newspapers that the London and North-Western Railway Company have purchased, or intend to buy, American steel, or steel rails, for use upon their line.

THE proposal to erect Corporation baths in Aberdeen at an estimated cost of £23,000 has been deferred. A considerable amount of opposition has been offered to the scheme, especially in view of the proposal to extend the bathing station at the sea beach.

PLANS for the new Post Office buildings to be erected in Dock View Road, Barry Dock, have been submitted to the Public Works Committee of the Barry District Council; and as they have now been altered so as to comply with the bye-laws, have been passed. Building operations will therefore commence immediately.

IN the matter of scaffolding, says a Paris correspondent, the Arc de Triomphe is likely to beat the record. A great portion of this which was taken down to do honour to the Tsar had been up for nearly eighty years. After six months' hesitation, the authorities have again begun to cover the beautiful groups Départ, Paix, and Triomphe, and the next century will probably see these poles and planks as fixtures.

MRS. WORTHINGTON has left her residence, Derwent Bank, Derby, to the Derbyshire Infirmary, for the purpose of a convalescent home. Should the Infirmary authorities deem the mansion unsuitable, they are empowered to sell it and benefit the institution to the amount of £10,000.

THE directors of the new line to London have decided to have their carriage works at Leicester and at Woodford, ten miles from Banbury. They have purchased 60 acres of land for the erection of locomotive sheds, sorting sidings, and other works, which are now in progress.

THE new block of offices adjoining the Westminster Palace Hotel in Tothill Street, Westminster, which is to be called Broad Sanctuary Chambers, is to be provided with an electric lift, to carry seven persons. The contract has been placed with Messrs. Easton, Anderson, and Goolden, Limited, London and Erith.

THE work of decoration at the Yarmouth Town Hall is completed. The plans were drawn in the Town Surveyor's offices, and the carrying out of the designs was entrusted to Mr. J. E. Dyson and Mr. J. T. Goffin, two local tradesmen. The whole scheme of the decorations has been worked out in shades of grey, terra-cotta, and cream, with gold enrichments.

## GREEK SCULPTURE AND GREEK LEGEND.\*

BY F. S. GRANGER.

(Continued from page 68.)

LET us proceed to note that the modern schools of Sculpture, which professedly derive from the antique, are separated from their originals by a similar interval. I do not mean to assert, of course, that such buildings and such sculpture cannot be of the first order without the use of colour, but I venture to maintain that they are parodies rather than imitations, if we view them with respect to their originals. We have no less an authority than that of Praxiteles, the sculptor of the Hermes of Olympia, for saying that Sculpture is benefited by

## THE APPLICATION OF COLOUR.

The recent discovery of the beautiful sarco-phagi at Sidon, with their beautiful colouring, has furnished us with a standard by which we may appreciate other works of Art. that have been less fortunate. "The colour thus applied," says Professor Gardner, "does not obscure the texture of the marble nor the delicacy of the moulding; on the contrary, it makes both more visible by giving a variety to the monotonous whiteness of the surface; it relieves the fatigue otherwise caused by the study of colourless form, and assists the eye to observe many subtleties of modelling which it might otherwise be unable to appreciate." I am quoting from the excellent handbook of Greek sculpture recently published by Macmillan. The author was, until recently, the director of the British School of Archaeology at Athens, and in that capacity has laid many English travellers to Athens under very deep obligations. I had the advantage of Mr. Gardner's company during one or two visits to the Acropolis, and I gladly avail myself of this opportunity of acknowledging my indebtedness. I am supposing that we have now passed by the great bronze statue of Athena, and that we have the Erechtheum on our left. While the modern Architect is struck by the irregular disposition of the building and the refined delicacy of its detail, the Athenian would think of the venerable image of the goddess, of her sacred olive tree, and of the salt water spring of the sea god.

## THE BEAUTIFUL FIGURES

of the southern porch have also a sacred office; they are really representative of the young girls who carried certain sacred baskets in the triumphal procession. Does it not seem as if they, too, were about to fall in with the company, as they stand there with one foot moving forward? If the maidens of the Erechtheum seem to be moving towards us, the figures on the frieze of the Parthenon are keeping pace with us. For between the columns of the Parthenon we catch continually fresh glimpses of a band of sculpture, the marble counterpart of the procession of the Athenian people for ever travelling towards the eastern door. The example is taken from the western frieze, and represents some of the Athenian cavalry. It is specially interesting for the beauty of one of the heads. This type seems to have been imitated widely upon contemporary coinage. But we must not stray very far into the by-paths that open on either side; the procession is still moving on towards the eastern entrance. In the centre of the eastern frieze the chief person in the Athenian hierarchy, the Archon Basileus, receives from a boy the new robe that has just been brought for the divine guardian of the city. When the spectator reached the eastern end of the temple he found overhanging him the great cavernous pediment in which the more than life-size sculpture stood out from the background with almost oppressive reality. Surely there, on the annual festival, as the horizontal rays lit up the sculpture in the early morning, it would seem as if the mysterious birth of Athena were happening. The crude realism of the vase

painting which we studied a short time since could not satisfy the great Artists who worked upon the Parthenon. Fortunately there is a relief, now in Madrid, which enables us to imagine with some likelihood what the central portion of the group must have been. We may suppose the Sculptor to have dwelt rather upon the mystical signification of the old legend; the coming forth of a spirit of wisdom from the mind of the supreme god, wisdom strong in the possession of spear and helmet and buckler—with the spirit of victory reaching forth the olive crown in the sure confidence that it would be earned. It would be difficult to exaggerate the influence which this vivid presentation of their patroness exercised upon the Athenian mind; even the most foolish of the Athenian orators must have been sobered, and the most stupid have had some glimmering of intellect, when from the assemblies of the citizens in the plain below they looked up to the Acropolis and thought of all that it meant. When Constantine in his new capital dedicated his great Church to the Holy Wisdom—Santa Sophia—the dedication was in striking harmony with the ideal embodied in Athena. If the influence of the goddess floated down from the Acropolis upon the city below, it found its concentrated expression in the great statue of Phidias. Of the statue itself

## EVERY TRACE HAS PERISHED,

and we must seek a substitute in the copies that have survived the wreck of the classical civilisation. Of these the most useful is the little statuette found near the Varvakeion Gymnasium in Athens, and named from the place of its discovery. "The statue," says Pausanias, who saw it in the second century of the Christian era, "is made of ivory and gold. In the middle of the helmet is a sphinx, and on either side there are griffins. The goddess stands erect, clad in a robe which reaches to her feet. On her breast is the head of Medusa wrought in ivory. With one hand she supports a victory of about four cubits in height, and in the other she holds a spear. A shield is placed against her feet, and near the spear is a dragon. On the pedestal the birth of Pandora is represented." The little statuette is concordant enough with the description of Pausanias to make us think it to be a fairly accurate representation of the general composition of Phidias' great work. There are still remaining traces of colour, of red and blue upon the sphinx, and of red upon the aegis. But the statuette falls far short of the style of the original. Let us correct it by reference to a head

## FOUND NEAR THE ACROPOLIS.

It is supposed to be copied from the work of Phidias. The eyes have been represented by a bony material inserted in the sockets, and the hollows of the pupils were once filled in with some gem or enamel. The hair was gilt, as we may see from some traces, and the head was covered with a helmet. I know scarcely any other object which enables the modern better to realise the vivid effect of Greek sculpture; its power "to bring the living features out of marble," a power so poetically figured in the legend of Pygmalion. With these introductions, let us enter the presence of the great statue as Fergusson, I think, has restored it. The details of the restoration are more or less open to question, and although I trust the drawing fails to do justice to our conception of the goddess, it may serve to concentrate the ideas with which we have been occupied. Let us sum up our conclusions. We began by observing that the Architectural surroundings of Greek sculpture were rendered much more vivid by the help of colour than modern Architecture designed in Greek styles would lead us to expect. We noticed, further, that the use of colour in sculpture must have produced an effect somewhat unfamiliar to our modern taste. These two considerations warned us against supposing that we have really fathomed all the

## MEANING OF GREEK ART.

We noticed also, that the real source of the Artistic unity of the works of Art upon the Acropolis was to be found in certain beliefs of

a religious character, beliefs which offer some striking points of resemblance to the mediæval beliefs which, in their turn, found a similar expression in Sculpture. Let us contrast these conditions with the conditions of the present. There now in England is no general and vivid imagination of sacred personages and events to which the Artist can appeal, or to which he can minister. I am not concerned to discuss whether such an imagination does or does not deserve cultivation. I am merely stating a fact which is of transcendent importance for the public interest in Sculpture. Secondly, and lastly, by foregoing the use of colour, the Architect and the Sculptor resign the most powerful charm at their disposal. I will ask you to think of the drab stonework, and the dull Sculpture of the British Museum façade, and, when you have done so, to agree with me that Greek Architecture and Greek Sculpture have never been really revived in England.

The discussion was opened by Professor Gardner, who wished to emphasize, even more than Dr. Granger had done, the loss we suffered through the absence of colour in our Sculpture and our Architecture. Of course they must remember that the conditions in England were very different from what they were in Greece, and he was afraid that if we were to build a Parthenon in London it would not at the end of ten years look at all like the one in Athens; the soot would obscure it. We had conceived the notion that colour was applied to obscure inferior material, but we should find in the Greek statues and temples that the colour was applied with the greatest moderation only to the smaller lines, and never in such a way as to obscure the whole front. We must, of course, admit that the Greeks had used colour to cover up the inferior buildings, but still he could not help thinking that the forms of classic Architecture would seem more living if we could only see them in the fulness of colour given to them by the Artist.—Mr. Grey Skipworth followed. Granting that colour was to be used in Architecture, what modification was to be made? How would we use colour in London? He had been very much struck by the want of something to relieve the dullness of London buildings, and he asked if it would not be possible to do something to improve the material and consequently the appearance of the numerous brick buildings in the Metropolis.—Mr. G. H. Fellowes Pryne thought the religious feeling which the Sculptors of Athens brought to bear upon their work, and evidence of which was also discernible in Mediæval Architecture, was deplorably deficient in modern Sculptors. Another lesson they could learn was that the Artist and draughtsman ought to be more in touch with the Architect, and the Architect more in touch with the Craftsman. They were "floundering in the dark" as regards London material, and until they found a material which would show off their decorative work, he was afraid no improvement would be brought about.—Mr. Banister Fletcher did not think we in England should ever see the introduction of colour on sculpture, and he really did not see the necessity for it. The use of coarse stone—necessary when colour was to be used—was one of the greatest drawbacks.—The Chairman wound up the discussion, remarking they all felt that it was impossible to conform to the condition that if Greek Art was to be imported into England it must be imported with its sculpture and its colour. In England there was no religious inspiration to lead us to concentrate our efforts upon great monuments, but at any rate there was some municipal inspiration, and he looked forward to the time when in England even second and third-rate towns would have a very fine building in which the history of the town was embodied.—A vote of thanks to Dr. Granger was carried, and briefly acknowledged.

PLANS have been passed for a new railway station at Lancaster to cost £50,000.

A SUM of £16,000 has been offered by the authorities of the New York Museum to an artisan in the Johnstone ironworks for an old painting in his possession, which has been found, on examination, to be a valuable Rubens.

## THE EDUCATIONAL TRAINING OF ARCHITECTS.\*

BY LEOPOLD EIDLITZ.

(Continued from page 70.)

MR. JOHN SLATER, before reading the paper, explained that he had been invited to undertake that task by the Vice-President. The paper was characteristically and essentially American. They knew the Americans were strictly utilitarian people, with rather a contempt for tradition and traditional usage; they adopted methods of their own with regard to building, and he was bound to say that with a good deal in the paper he could not personally agree. Mr. Eidlitz was an Architect practising in New York, and was the author of a book, published a short time ago, on the nature and functions of Art. But when an Architect asked people to throw over study of the work of the past as being of very little benefit to the student, he was afraid very few supporters would be found in this country. The main point in Mr. Eidlitz's paper was that form in Architecture was always to be in proper relation to the strains and weights which they had to carry. No doubt a great truth underlaid the paper, and, in the speaker's opinion, the present phase of American Architecture was due to the fact that the huge, lofty buildings in the States had iron supports—encased in stone in order to look like stone piers—which were not strong enough to carry them. He held that the supports of buildings ought to be proportional to the weights they had to carry, or they would derive no pleasure from the aspect of the building. But he was afraid that if they were to adopt as the text book of their Architectural studies or Architectural education the mere mechanical formula of the proportion of weights and strains, they would not clothe

## THE DRY BONES OF BUILDINGS

with any life at all.—The discussion which followed was opened by Mr. H. H. Statham, who, proposed the usual vote of thanks.—The vote of thanks was seconded by Mr. Emerson, the hon. sec., who read the following commentary by Mr. Arthur Cates, that member being absent:—"The educational training of Architects, with which the Institute is concerned, is clearly not one in which 'they shall be taught to know everything,' nor is it one the aim and object of which is to produce the evolution of 'a new style,' whatever that once much-used phrase may mean. The educational training which is now organised aims at fitting the student for the acquisition of the knowledge necessary for the satisfactory practice of his profession in developing his natural artistic and scientific ability, so that he may apply both to the expression of his ideas in design and in the realisation of his conceptions. In the complex conditions of the practice of the day, the Architect must aim at acquiring the power to attain success in designing buildings which shall be convenient and appropriate in arrangement; shall be of stable construction; and shall be of suitable and beautiful design, both as regards masses, form, and detail. The first studies of the aspirant should be devoted to a mastery of Classic and Mediæval work—intelligently studied, with a thorough acquaintance with form and detail—leaving the Renaissance and later developments to a subsequent period when he can bring to bear on their consideration the knowledge acquired in the first years of his studies. In both periods the sedulous cultivation of the Art of accurate and effective delineation, and of sketching detail and ornament from buildings and from memory, thus bringing eye and hand and brain into harmonious and mutual action, is of the highest importance. Concurrently with this, the study of the history of

## THE SEVERAL PERIODS OF ARCHITECTURAL ART

is of the greatest value, not as a mere matter of dates and names, but as giving life and

\* A paper written by Leopold Eidlitz, of New York, and—in his absence—read by Mr. John Slater at the Royal Institute of British Architects.

interest to the subjects studied, connecting them with the actual social life of the people by whom they were evolved, and with the political, social, and religious influences which controlled their design. The Institute has an excellent opportunity to afford encouragement to the study of the means of satisfying new wants, by the use of new materials and new methods of construction, and the more extended application of those materials with the existence of which we are familiar, but of whose capabilities in, perhaps, unexpected directions we have no appreciation. The Soane Medallion and its accompanying travelling studentship is in the free and uncontrolled disposition of the Institute. At present the only qualification of competitors is that they shall be 'British subjects under the age of thirty years,' with the result that there is each year a great amount of misdirected and wasted energy on the part of untrained competitors who have entered on Design before they have mastered the essential principles which should govern it. By altering the conditions to secure that these principles should have been mastered, and even by securing that the competitors should have had some reasonable training, by making Associateship or qualification there for an express condition, the results would certainly be more satisfactory, the cause of the educational training of Architects be greatly advanced, while some new developments of design arising out of the

## APPLICATION OF NEW MATERIALS

might possibly arise. The questions raised by 'The Text-book' suggestion were considered a short time ago from a different standpoint by the Committee of Education of the American Institute of Architects, and Professor W. R. Ware says in relation thereto—"The Committee on Education expressed the hope that if the study of the historic styles was systematized and co-ordinated in the schools, such an effective concentration of intelligent effort might aid in developing a system of Architectural form that should be nationally characteristic, and should be more accurately adjusted to the expression of modern American life than those now in vogue." All reasonable men must agree with the conclusions so well expressed by Professor Ware, and be content to await the development which must follow carefully conducted educational training, kept free from mere academic influences, and this Institute need not look further ahead than to continue steadfastly in the course already adopted, and thus eventually secure that all its members shall have had that thorough and systematic artistic, scientific, and practical training, based on

## A SOUND GENERAL EDUCATION,

which will ensure that the title of Architect and membership of the Institute shall imply that its possessor may reasonably be expected to be a reliable and trustworthy adviser on all Artistic and practical details, and also a well-educated man, standing at least on a level with the average of his clients in knowledge of all ordinary topics of Art and general history, and superior to them in his special and technical knowledge. An Architect will then, so far as personal characteristics may permit, in some degree combine the imagination of the artist, the intellectual clearness and precision of the mathematician, and the experience and readiness of the practical man with the culture and refinement of the educated gentleman."—The debate was continued by Mr. Woodward, who maintained that it was perfectly defensible for an Architect to take advantage of a cast-iron stanchion by encasing it in stone or other material.—The Chairman (Professor G. Aitchison, A.R.A.) said Mr. Eidlitz was the only person he had ever come across who had a due belief in the importance of Art to mankind. For this reason a great charm was added to Mr. Eidlitz's book, but he could not agree with him in all his ideas of Architecture. The theories and practice of Architecture could not be changed in a generation, or anything like it.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,

March 17th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

A CURIOUS anomaly in the law as to the provision of the means of egress from buildings is receiving the attention of the London County Council with a view to its rectification. Whereas theatres and factories fall within the purview of the Council, which is empowered to insist upon adequate facilities for escape being provided, Board schools enjoy exemption, and no one has authority to act in respect to those already built. The matter is to be brought to the notice of the Education Department with a view to powers being granted so that the Council may exercise the same jurisdiction that exists for other buildings.

ADDINGTON Park is to be sold, and the proceeds are to be put to more practical uses for the Primate and the Church. Part of the money will provide the Archbishop with a residence of modest dimensions at Canterbury, the rest will be devoted to Church work. Addington Park is one of those possessions of which thoughtless persons envy the Primate. The views are superb, and the huge mansion, built over a century ago by a London Alderman, and improved by Sydney Smith's "Howley," is a monument of old-fashioned comfort. The cost of maintenance is ruinous. This is but one of the country seats that eat up the revenues of the See to no purpose, and its abolition was urged at the late change of incumbency.

THE annual exhibition of the Water-Colour Society of Ireland opened on the 8th inst. in the Leinster Hall, Dublin. As compared with the display of last year, it is questionable if the present exhibition shows an all-round advance, but last year's drew together an exceptionally fine collection of studies, and a maintenance of the degree of merit then attained would be a sufficiently noteworthy result. A great many of the coast views exhibited this year have undeniable features of merit, and other odds and ends picked up from a variety of sources are wonderfully well executed. But there is, on the other hand, a good deal that is mediocre, and a large proportion of studies lacking in originality of conception.

WE understand that the object of the First Commissioner of Works in hanging the three historical paintings, which were formerly in the Members' old smoking-room at the House of Commons—now the third dining-room—in Committee Room 10 is in order that they may be fully inspected, with a view possibly to their removal to some picture gallery in London or the country. The larger of the three canvases, which is by G. F. Watts, R.A., measures 19ft. 11in. by 12ft. 2½in., and represents Alfred inciting the Britons to resist the Danes. The others are the "Pardon of Bertrand by Richard Cœur de Lion," by Cross, and "The Burial of Harold," from the brush of Mr. Pickersgill. They were all executed about fifty years ago, at the request of the Fine Arts Commission—of which the late

Prince Consort was chairman—for the decoration of the panels of the House. Since 1895 until the present time they have been stowed away, there being no space available in which they could be displayed to advantage.

GESSO work just now is attracting attention at various Art and Crafts exhibitions. Gesso is described by Mr. Mathew Webb, the best authority on the subject, as one of the minor byways of Art and a means of embellishment, touching, on one hand, painting decoratively combined with a treated surface, and, on the other, modelled relief decoratively combined with colour. In the surface work of Egyptian Sarcophagi traces of the use of gesso has been discovered, and it was combined with canvas for the purpose of embalming. From time immemorial it has been used as a priming to cover wood, as can be seen in many carved statuettes at South Kensington, and it was employed to give surface finish before colouring to stone carved effigies, as clearly shown by various effigies in Westminster Abbey and the Temple Church. The dry gesso work of the early Florentines was especially beautiful, and when engraved and gilded delightful effects were produced. Fra Angelico and Lippo di Dalmasio have left some lovely examples of this combination of gesso engraving and gilding. Another application was "brush modelled gesso," which was hardly suitable for design intended to cover any large area. Beautiful specimens of this kind are to be seen on Italian marriage coffers, of which there are many fine examples at South Kensington.

MR. ALEXANDER REID, the senior partner of the firm of A. and W. Reid and Willet, Architects, Elgin, recently died at Elgin, at the age of seventy-six. Deceased was a native of Lomnay, Aberdeenshire. It may be said that his sphere of work extended from the Deveron to the Ness, and even beyond. He had a good business connection with Banffshire, and, indeed, one of his first engagements as an inspector of works was in connection with the building of the Free Church of Banff soon after the Disruption. In Elgin he leaves several memorials of his work, amongst them being the new Academy. He planned most of the principal dwellings in Elgin, and also a considerable number in the county.

FOR some time past the public has been in possession of an offer of great importance to London. The Ecclesiastical Commissioners are the owners, in right of the see of London, of a large estate at Highgate. It was understood that Churchyard Bottom Wood should, if possible, be purchased, and the Commissioners, after consideration, fixed its price at £25,000. Anyone acquainted with Highgate, and aware of the rapidity with which new roads are being laid out and new houses springing up in that neighbourhood, will be of opinion that the sum asked is a moderate one, probably much less than the Commissioners would realize were they to throw the land into the market. It is certain that far higher sums have been paid for other open spaces acquired for the public in recent years—for Parliament Hill and the adjacent fields, for example, or for the Hilly Fields at Brockley. Circumstances have led to some delay in meeting the Commissioners' offer. But within the last six months a vigorous effort to raise the necessary money has been set on foot in the locality. The Urban District Council has voted £10,000 towards the sum required by the Ecclesiastical Commissioners, and has expressed its willingness to accept and take charge of the wood. The example thus wisely set has been emulated by a local committee, which, under the guidance of Mr. Cory Wright, has succeeded in raising between £2000 and £3000 by local subscriptions. There remains some £12,000 to be made up. To secure this sum a joint committee has been formed of the rural open space societies and the local organization, and appeals have been made to the County Councils of London and Middlesex, the Vestry of Islington, and other bodies and persons.

THE third lecture of the course on "Hellenic Architecture," by Mr. W. J. Anderson, A.R.I.B.A., was delivered on Wednesday, the 3rd inst., at the Glasgow School of Art, and aimed at presenting a view of the structural development of the archaic Doric style in Sicily and Magna Græcia. After a survey of the historical displacements which resulted in the settlement of the coasts of Southern Greece and Italy, Crete, and Sicily by Greek tribes under the influence of Dorian manners and religion, the growth of the Greek city was sketched from its citadel Acropolis to the temple-crowned hill of the succeeding period, surrounded by its agora, stoa theatre, gymnasium, &c. Attention was drawn to the evidences of enlightened design in the setting of the buildings, and the skilfully-prepared transition from the natural surroundings to the building itself, and the point was illustrated by views of Agrigento and its range of great temples. The Doric order was traced in its progress from the archaic reliefs of Selinus to the period following the Persian and Carthaginian wars, and photographs, details of restorations, shown of the temples of Paestum, Segesta, and the Heracon at Olympia. Summing up, the lecturer concluded that, although grandly proportioned and highly impressive, the Doric temple model was a work of Architecture only in the second rank, and there was nothing in these buildings quite comparable to the refinement, the freedom, and certainty of drawing which characterised the corresponding phase of Ionian Architecture. In place of this the Dorians supplied a ponderous and logical stone construction, naively expressive of its wooden origin, and forming a noble frame for figure sculpture, without which it was incomplete. The perfection of the following period in the Parthenon and Propylea was due largely to the fact that the model was adopted by the Ionians of Athens, who, apart from sculpture, combined it with Ionic features, and conferred upon it all the graces of drawing and refinements of line and proportion which distinguished the Ionian Art.

STREET decorations in London are seldom satisfactory. Venetian masts, a few flags that have borne the battle and the breeze for years, tawdry festoons of paper roses, and red drapery, with common-place mottoes, pretty nearly exhaust our resources in that direction, and the result is anything but satisfactory as a spectacle, or creditable judged from an artistic standpoint. A genuine effort is to be made to introduce something really worth seeing in connection with the Diamond Jubilee celebrations. Already a representative committee has been organised, and plans suggested by Artists of note are now being prepared with a view to the arrangement of a scheme worthy of the occasion.

THE naval authorities have recommended a scheme for the extension of the naval yard in Hong-Kong. Details of the scheme are not yet available, but a sum of between £250,000 and £300,000 will be spent by the Admiralty with a view to transforming the Hong-Kong establishment into a first-class naval base. The decision arrived at is in favour of a reconstructed naval establishment. To provide a site for this, the foreshore in the City of Victoria will be reclaimed for a distance of 600ft. into the harbour in front of the present military and naval enclosures. Certain objections by the Colonial authorities have been overcome, and a working arrangement arrived at between the naval and military authorities for the exchange of ground, whereby the naval yard will have the whole of the sea-frontage on what is undoubtedly the best site, regarding the matter from the strategical standpoint. The plans are in London, and the staff in Hong-Kong is awaiting orders to make a start with the work. Already a large quantity of valuable machinery has arrived, and it is stored away in readiness for the extension.

THE Bishop of London presided at the Paddington Vestry Hall, over a meeting in support of the movement for building a new Church and separating the parish of St. Simon

from those of St. Jude, Kensal Green, and St. John, Kilburn. According to a statement made, a suitable site, with a donation of £500, has been given by the Ecclesiastical Commissioners, and the Bishop of London's Fund guarantees £1400. The total promised amounts to £3700, leaving about £2000 more to be raised before the Architect's plans can be carried out.

THE highest bridge of any kind in the world is said to be the Leo River Viaduct on the Antofagasta Railway in Bolivia, South America. The place where this highest railway structure has been erected is over the Melo rapids in the Upper Andes, and is between the two sides of a canyon which is situated 10,000ft. from the level of the Pacific. From the surface of the stream to the level of the rails this celebrated bridge is exactly 636½ft. in height, the length of the principal span is 80ft., and the distance between the abutments is 802ft. The gauge of the road is 2ft. 6in., and the trains cross the bridge at a speed of 30 miles an hour.

THE great catalogue of Assyrian tablets preserved in the British Museum is now complete, and will afford students valuable material for the study, not only of the Assyrian language, but also the literature, sacred and profane, of Assyria and Babylonia. The catalogue, which was compiled by Dr. C. Bezold, gives measurements of every tablet and cylinder whether complete or only a mere fragment, and in many cases furnishes extracts in Assyrian of important portions of tablets. There is also a bibliography of the most important Assyriological publications up to date.

THE Rev. Canon Benham delivered the last lecture of the season at the London Institution, on "Cheapside." He began by describing the old Watling Street, which ran from the site of the Cannon Street station straight as an arrow to what is now Newgate Street, and then away on the line of the present London and North-Western Railway. At the top of what we call Cheapside was formerly a large open space, the meeting-place of the folk-mote. Then the lecturer spoke of St. Paul's, and afterwards of St. Martin-le-Grand. Each point was illustrated with limelight views. Cheapside, which meant literally "Market-place," held, it was pointed out, the same relation to the City as the market-places of our country towns hold still to those towns. Having given anecdotes of the Churches in Cheapside, and of the jousts and tournaments which had their place in the open space in front of St. Mary-le-Bow, a space which went back as far as Honey Lane Market, the lecturer turned his attention to the old cross which stood a few yards to the east of the churchyard of St. Peter's, Wood Street. He recalled many historic scenes which had gathered round this cross, and described its destruction by the Puritans on May 2nd, 1643.

At a recent meeting of the Belfast Literary Society, Mr. W. S. Johnson, M.A., gave a lecture on the "History of Architecture." In opening the meeting the chairman said they were often told that there was a great want of sympathy with the beautiful in Art in Great Britain, and more especially in the North of Ireland. He thought that view was rather exaggerated. With regard to poetry, the people of Great Britain had a bright and fertile vein of imagination, and as regarded Architecture, there was nothing more beautiful than some of their great English Cathedrals. Mr. Johnson, after defining Architecture, and indicating its place among the fine Arts, commenced with the Architecture of Greece, and showed York Street, May Street, and Donegall Square Churches as examples of the Doric, the Ionic, and the Corinthian styles, though none of these buildings are faultless. In the last-mentioned there are also Roman arches: then in Townsend Street there is good Romanesque work; also in St. Patrick's, Jordanstown; while in St. Thomas's and Carlisle Memorial are really fine specimens of early Gothic; in Fitzroy and Newtownbreda of geometrical and

decorated Gothic; and in All Souls' of perpendicular English Gothic. Elmwood is an example of a very original treatment of Italian Romanesque, while St. Ann's is almost the only Renaissance Church in Belfast. It is worthy of note that in 1844 this was the only Belfast Church which possessed a spire.

THE Building Trades' Exhibition at the Royal Agricultural Hall, which will extend over six days, opens on the 20th inst. The opening ceremony will take place at noon, and will be performed by the Lord Mayor (accompanied by the Sheriffs of London). The Architectural Association will pay a visit to the exhibition on the afternoon of the opening day, and amongst the other societies which have arranged an official visit are the Association of Medical and County Engineers on the 22nd, and the Builders' Mechanics Association of London on the 24th, whilst on the 23rd the annual meeting of the Institute of Clayworkers will take place, and on the 25th a Conference of House Painters and Decorators will be held. Architects' drawings are on exhibition, and other exhibits will include loans from the South Kensington Museum, the Corporation of London, the City Companies, etc.

A most interesting discovery has been made at Leap Castle. This beautiful old keep is in a state of preservation scarcely to be surpassed by any baronial residence in Ireland, and in extent and historic interest has few equals. The principal discovery was that of the existence of a fine old guard-room at the south-west angle of the hall. Its occupied space was previously regarded as a mass of solid masonry. It is built in the wall of the great tower, these walls being from eight feet to ten feet thick, and leads to a series of dungeons beneath, capable of holding from 500 to 600 people. The dungeons are hewn out of the solid rock on which the castle stands. In another part of the ancient structure, known as the Priests' House, a large number of human bones mixed with those of a dog were found, and some coins of the reign of Edward the Confessor in the first half of the eleventh century. These have a rare numismatic value from their great age and fine condition. Elsewhere coins of Elizabeth and Charles II., etc., were brought to light, but, though of interest, are less scarce than the Confessor's. This priests' house was formerly connected with the great tower by a drawbridge, traces of which can be seen, and the clerics in time of war took refuge in the keep. The house was occupied by O'Banan, Abbot of Roscrea, who died in 1128, and it is assumed that the Confessor's coins now found must have been deposited about that time where they were discovered, and have lain undisturbed for nearly eight centuries.

PROFESSOR BALDWIN BROWN, Edinburgh, lectured in Moffat on Italian painting a few days ago. He said that from the fresco painters of the fifteenth century, the Art of painting had progressed in Italy, until in the seventeenth century it had reached its culminating period. By that time the secret resources of Art in painting had been fully explored. Part of this work was accomplished in Italy, and part in Spain, Flanders, and Holland. The Artists had mastered the human form nude and draped in all its details, learning to draw the figures in all positions with grace, dramatic power, and sympathetic style. The effects of light and shade in all their strength and beauty had also been mastered, and the knowledge gained and impressions of distance depended on certain differences of light and shade. In the matter of colour the Artist had mastered the delicate interpenetration of colour which the fresco painters were unable to use in wall painting. The latter-day painters by the use of sympathetic colours gave a play or view with a more delicate and subtle effect than a fresco, while the process was more elaborate and capable of more variety in manipulation, and all sorts of refinement could be given to the subject. This was worked to perfection by the Venetian school.

Then in the seventeenth century the picture, formerly a wall decoration, acquired beauty and charm of its own, became independent, and the modern picture was perfected.

SPEAKING at the annual prize distribution in connection with the Art and Technical Schools and the Boys' and Girls' Modern Schools, branches of the Leeds Institute of Science, Art, and Literature, Mr. George C. Haité, R.B.A., who presided, said that he had had twenty-five years' experience as an Artist and a Designer. In directing students what to do, people often neglected to give information as to the means by which their advice should be followed. He would rather that Schools of Art had been called Schools of Technique. The most such a school as theirs could do was to give students that technical knowledge which would enable them to realise their own ideas and feelings. It was absurd to imagine that a school could make Artists. To do that was not within any one's power. A school could only produce skilled artisans. If natural talents were to be of the slightest avail, means of expression must be acquired, and that was the mission of the so-called Art school. He wished strongly to impress upon Art students the importance of cultivating the faculty of observation. Few knew to what a slight extent the faculty of observation was developed in the ordinary individual. To seek to understand the secrets of nature through Art was foolish. The mind was the medium through which nature should be studied. Above all things they must be true to themselves. They would be unwise to seek after what was called originality, and which oftentimes was only acquired eccentricity. The hand was subservient to the brain, and if the hand was unskilful, imagination was of little use. Too many people thought Painting alone constituted Art. Art had made herself manifest in Sculpture, Architecture, and in articles of every material. An Artist should recognise and appreciate every phrase of Art. Mr. Haité, in conclusion, gave valuable hints as to the study of Decorative Art, saying that the time was not far distant when articles of everyday use would bear traces of the skill of the Artist.

MUCH has been written about the Parthenon, but the most exhaustive work is that of M. Magne, which has been published under the auspices of the French Ministry of Fine Arts. M. Magne was one of the Architects consulted as to the best means of saving the building from falling, and his book is the fruit of his examination. His verdict is preserve, not restore, for he rightly says any attempt at the latter would be sacrilege. But, apart from his plans, his observations throw new light on the mode of construction, of lighting, and the decorative use of colour. Colour was largely employed to accentuate the portions of the structure which received least light, as in the ceilings, the mouldings of the frieze, and the cornices. The colour, though, was like that of the statues, only enough to temper the whiteness of the marble. Metal also was employed in the form of bracelets, crowns, spears, shields, bits, and harness, but this is evident from the cylindrical holes in some of the Parthenon sculptures in the British Museum.

"If it be in any way possible for the nation to acquire Hertford House," says a Times correspondent, "surely that would be the best and most appropriate permanent abode for the magnificent collection bequeathed by Lady Wallace. It meets the conditions attached to the bequest; it is in a central situation; it is a building worthy of the treasures it contains, and it has been specially laid out for their display. We cannot more gracefully express our gratitude for this splendid gift, or more loyally carry out the evident wishes of the giver, than by permanently connecting the collection with the historic home of those who formed it. As a minor but far from insignificant advantage, it may be noted that the acquisition of Hertford House would obviate many inconveniences and risks which are otherwise too likely to

be encountered before a new home can be found or built for the superb collection."

WITH reference to the question of the long-deferred completion of South Kensington Museum, proposed by Lord Playfair in connection with the Royal Commemoration, we take a passage from an eloquent appeal of M. Charles Yriarte, the Inspector-General of Fine Arts, published *in extenso* in the Times Paris letter a few days ago: "To-day for all of us foreigners South Kensington is a Mecca. England there possesses the entire Art of Europe and the East, their spiritual manifestations under all forms, and Europe has been swept into the stream in imitation of England. Berlin, Budapest, Vienna, Nuremberg, Basle, Madrid, St. Petersburg, Moscow, the large towns of America itself have now their South Kensingtons; but in the original one of England, still unfinished, where the splendour of the start (excessive, as it seems to me) contrasts with the inertia of the last fifteen years, the inconceivable treasures are becoming so much heaped up as to be a veritable obstacle to study. How is it possible to study this extraordinary series of textiles of all times and countries, ranged one upon another, overlapping and hiding one another, without proper perspective and proper light? And the draperies, the embossed Italian and Spanish leathers, the carved wood, the iron work, the *cassoni*, the lacquer, placed at such an elevation that one is obliged to mount steps to study their form and colours. . . . It is not for me to give an opinion on the Architectural part of the work to be accomplished. South Kensington is especially a museum for study, and for study a mere box is sufficient, spacious, well-lighted, with as few projections as possible, of no exaggerated height, easy of access, but, above all, with space and light, and lastly, from due respect for Art, with decent surroundings, a fine entrance, and no unsafe neighbouring buildings. The Architects will be unable to protest. They know that in Architecture the external expression of a requirement fulfilled, a form appropriate to the object aimed at, inevitably gives a monument its character. Ornament is neither in the material employed nor on the wall, where it sometimes distracts attention; it is especially in the Art object itself, and imagination can find ample scope outside. I desire, therefore, for the entire nation the realisation of Lord Playfair's proposal, the completion of the Victoria Museum for the advantage of Art studies, and the development of public taste, and this out of gratitude for the facilities of every kind found by foreigners of all nations in the great English public depôts."

THE movement for the erection of a memorial to Mrs. E. B. Browning in Kelloe Church is about to be accomplished. We understand that Messrs. J. McMillan and Son, Sculptors, of that town, have been instructed by the committee to prepare a marble tablet to be placed in the Church. It had long been a disputed question as to the birthplace and date of birth of the great poetess. The Rev. Canon Burnett discovered in the registers of Kelloe Church that Mrs. Browning was born at Coxhoe Hall on March 6th, 1806. The parentage of the poetess was afterwards discovered by Mr. John Robinson, their marriage having taken place at Gosforth, her mother being of a well-known Newcastle family. It is fitting, therefore, that the first memorial in England to Mrs. Browning should be in her native parish.

FLEET STREET will soon be improved beyond recognition. Already a portion of the southern side near Ludgate Circus has been widened, with beneficial results, and it is now desired to extend the process further westwards. Between Bride Lane and Salisbury Court the width of the thoroughfare is 45ft., and it is proposed to increase this to 60ft. The cost of the widening is estimated at £170,780, and the Improvement Committee of the County Council recommend that body to divide the expenditure equally with the City Commissioners of Sewers.

## Professional Items.

**ABERDEEN.**—Nine competitive plans have been lodged for the new Fire Brigade Station at Aberdeen. Mr. Munce, Belfast, has been appointed adjudicator. Some of the plans show buildings of striking appearance, with extensive accommodation for the engines and firemen. The front elevations generally exhibit a three-storey granite building, surmounted by a tower to be used for drying hose pipes and for drill purposes. On the first floor is the engine-room, entrance to which is obtained by three, and, in some cases, four large folding doors, which can be opened automatically, or by some other convenient arrangement. Within the engine-room is accommodation for two steamers, a hose tender, and a fire-escape. Immediately to the rear of the engine-room and communicating directly with it are the stables, with stalls for six horses. The interior arrangements of both engine-room and stables are of the most modern type. To the right of the engine-room and on the ground-floor is the firemen's watch-house, and still further to the right is the firemaster's office. On the first and second floors there is accommodation for firemen. The average estimated price would be from £9000 to £10,000.

**BEER, EAST DEVON.**—Professor Herkomer has opened a memorial to the late Hamilton McCallum, the well-known artist, who resided in the village for many years. The memorial takes the form of a Portland stone erection, with a bronze relief portrait of the late Artist. Around the structure are seats for the use of the public. The memorial was designed by Mr. Onslow Ford, R.A.

**BRADFORD-ON-AVON.**—A new Technical Institute has been formally opened at Bradford-on-Avon. The building is situate in Junction Road, and will give every facility for carrying out the work of technical education. The total cost is about £3900. The style is a form of English Renaissance.

**BRISTOL.**—The Parish Church of Nempnett has just been re-opened after important improvements, which both increase its size and adds to its appearance architecturally. The scheme completed, removed the chancel altogether with the arch, and has resulted in the erection of a much larger and finer chancel, carried up to the height of the nave, but separated from it by a beautifully-carved rood-screen. Besides this, on the north of the new chancel, has been built a sort of side chapel or vestry. Dundry stone has been used as dressings. The floor of the chancel is laid in patterns formed by pennant and a material of lighter colour, and the barrel roof is of unpolished oak. The alterations, carried out from Mr. Buckle's design by Mr. John Flower, harmonise well with the older parts of the structure. The undertaking has involved an outlay of about £1600.

**COLERNE.**—The Parish Church of Colerne, the original fabric of which dates back to the twelfth century, has recently had a valuable effigy of the late Mr. R. Walmsley, of Lucknam, placed within its precincts. The effigy has been modelled and carved in the finest statuary marble from Carrara by Mr. Henry Hugh Armstead, R.A. The tomb supporting the effigy, better known as "Altar Tomb," is in the style of Early Renaissance. There is a wrought-iron guard which surmounts the marble slab. The whole of the tomb was designed by Mr. C. E. Ponting, F.S.A., Diocesan Surveyor, of Marlborough, and the work executed by Messrs. Harry Hems and Son, of Exeter.

**DARFIELD.**—At a recent meeting of the parishioners of Darfield, the rector, the Rev. A. E. Sorby, explained that Trinity College, Cambridge, had agreed upon the details of the restoration of the chancel of the Parish Church. The plan was considered a good one. A discussion took place upon the

advisability of removing the plaster from the chancel walls, and the nature of the stone likely to be found underneath. The Chairman said that at first, only portions of the plaster would be removed, and if the stone underneath was found to be unsuitable for pointing, that the plaster would be left. In answer to other questions, he said that whatever brasses were now on the chancel floor would be carefully removed and replaced on the marble floor in exactly the same position.

**DEWSBURY.**—The Board of Management of the Dewsbury Technical School has approved of plans submitted by Mr. J. L. Fox, the Architect of the original buildings, for an addition to the accommodation, which has for some time been inadequate. The proposal is to erect a wing of three stories, having a frontage to Carlton Road. The cost is estimated at about £3500, and the Board of Management decided to recommend the execution of the work.

**DONCASTER.**—The great north transept window in the Doncaster Parish Church, which was destroyed by a gas explosion some time ago, has been filled with new stained glass illustrative of the "Te Deum." The six main lights are filled with three tiers of figures representing Cherubim and Seraphim, apostles, prophets, and martyrs, as well as Saints Ambrose and Augustine, the joint authors of the "Te Deum." The figures are surmounted by canopies of broad and simple design. The Mowbray window on the south side has been replaced by three lights, containing figures of three matrons. The whole of the work has been designed and carried out under the direction of the Architects, Messrs. Demain and Brierley, York, by Messrs. Shrigley and Hunt, of Lancaster and London.

**DUMFRIES.**—Dumfries School Board had before it, on the 8th inst., competitive plans by four local Architects for a new elementary school to be erected on a site off George Street, and to take the place of the present Greensands School. The plan of Mr. A. B. Crombie was unanimously adopted. It provides accommodation for 600 pupils, and is estimated to cost £6000. It includes an ornamental campanile, which the Architect suggests might be erected as a memorial to the Queen's diamond jubilee.

**DUNDEE.**—It will be remembered that towards the end of last year, Mr. Alexander, the City Architect of Dundee, was requested to report upon the condition of the foundations of the north and east walls of the Albert Institute Buildings, with a view to discovering whether it would be necessary to under-build them, as had been done with the south and west walls. When an opening was made a few days ago near the north-west corner, the cross-beams on the top of the piles were laid bare and found to be in a rotten and pulpy condition, similar to what had been found at the other parts of the foundations.

**EDINBURGH.**—At a meeting of the Works Committee of the Edinburgh and District Water Trust recently, the principal item was the consideration of the specifications and schedules of measurements for the Talla reservoir. The engineer (Mr. Wilson) was instructed on various matters concerning conditions which are to be inserted in the contract, in order to report to the Trustees. The probable estimate for the reservoir and consequent works is about £150,000. Approval was at the same time given to the plans of the building proposed to be erected for the accommodation of the Trustees on the banks of the Talla. The building is of a substantial appearance. The committee also decided to include in the estimates a sum of £250 for the erection of a hall for the accommodation of the navvies engaged upon the reservoir works.

At a meeting of the Plans and Works Committee of Edinburgh Town Council, Mr. Morham, the City Architect, submitted plans for the new central fire-station to be erected at the south-west corner of the

Cattle Market. These show a range of buildings, three storeys in height, in the Renaissance style of Architecture, with a high tower in the rear. The engine-house occupies the east part of the block, which is on a level with Lauriston. Mr. Morham also submitted plans showing the suggested re-arrangement of the Cattle Market in consequence of the erection of the new fire-station. A plan has likewise been prepared showing how, in the event of the Cattle Market being removed altogether from its present site, the ground might be made available for letting, with an access from Lauriston. It is suggested that tenements of houses might be erected on the north and east sides, leaving the remainder of the space for recreation and drill purposes. The estimated cost of the buildings, exclusive of the site, is £23,500. The Committee instructed Mr. Morham to have the plans exhibited to members of Council.

**EDWINSTOWE.**—The Lord Bishop of Southwell has just re-opened the Parish Church of Edwinstowe. The Church is, like the majority of village churches of the middle ages, a piece-work of late Norman and Early English, having Norman pillars in the north and south aisles and windows, while the arches are of the Early English style. The restoration work, which has been for a period of eleven months in the hands of Messrs. Hy. Green and Sons, Nottingham, comprised the entire re-roofing of the nave, aisles, and chancel—the nave and south aisle being raised a few inches—and the removal from the interior walls of the plaster which disfigured them, and concealed the peculiar beauty of their structure. The roofs are now of a substantial and beautiful type, and the walls betray a rugged beauty which many consider ought never to have been concealed beneath plaster. The work has entailed a cost of about £1800.

**GLASGOW.**—On Saturday afternoon the first Spring visit of the students attending the Architecture and Building Construction Classes of the Technical College took place to the new brickwork at Leedhill, near Paisley. The manager conducted the large party of students, who were first shown the clay-pit, where the nature and characteristics of the clay were explained; then the works were put in operation, and the various processes of mixing, wire-cutting, &c., were seen. Then the drying stoke was visited, and, lastly, the kiln was studied from the point of view of its construction, as well as the burning of the bricks. Professor Gourlay, in proposing a vote of thanks at the close, referred to the keen interest the students had taken in the visit and to the valuable instruction they had received.

**HARPENDEN.**—The new Congregational Chapel just opened has cost about £2600. The nave and side aisles are divided by octagonal stone piers, with low pointed brick and stone arches over. The nave is lighted by pointed arch windows in the clerestory, and the side aisles by small mullioned rectangular windows. There is a recess or apse at the upper end of the building where the organ is placed, and communicating therewith on each side are vestries. The internal walls are faced with red brick and stone dressings, the dado being a pressed brick of a darker tint. The roof is framed with solid-looking principals with curved ribs resting on stone corbels, and is ceiled at the level of the collar beam. The floor is laid with wood blocks except the lobbies and apse, which are tiled. The ventilation is effected by inlet air flues in the side walls, and Boyle's exhaust ventilator in the turret. The heating is by hot water. The exterior is of red brick and stone dressings, with a tile roof, the ventilating turret with copper roof forming a feature over the entrance vestibule. The Architect is Mr. A. E. Ansdcombe, of Harpenden, and the contractor Mr. T. Ringerlee, of Oxford.

**HARROGATE.**—A new school erected by the Pannal School Board at Oatlands Mount, near Harrogate, was opened on the 8th inst. by the Vice-Chairman of the Board. The school,

including site and furnishing, has cost about £6000. The Architect was Mr. Buttery, of Morley. The school is well lighted and ventilated, and is built for the accommodation of between 400 and 500 children.

**INKPEN.**—The ancient Parish Church of St. Michael and All Angels, Inkpen, after being in the hands of the restorers for over twelve months, has just been re-opened. The plans for the restoration were prepared by Mr. Clapton C. Rolfe, Diocesan Architect, of Oxford, and these have been carried out under his supervision by Messrs. George Elms and Son, contractors, of Benham, Newbury. Little more than the bare walls, the west window, and tiles from roof and floors have been left of the actual old Church.

**LIVERPOOL.**—The new Cotton Exchange in Brown's Buildings, Liverpool, has now been further extended by the addition of a café restaurant. A Mosaic floor is a notable feature, while the decorative and colour designs give quite an Oriental appearance to the apartments. The structural alterations were made in the building under the superintendence of Mr. J. F. Doyle, who is also the Architect of the building.

**LOWESTOFT.**—The stone-laying ceremony in connection with the new Y.W.C.A. at Lowestoft took place some days ago. The building is to serve as an Institute and Home. The present premises being found too small, the committee instructed Mr. Alfred Clarke, C.E., Architect, of Lowestoft, to prepare designs for a building which should combine both an institute and a home, part of which is now being carried out. The new building is situated at the corner of Regent and Alexander Roads, and is plainly but substantially constructed of red bricks with string courses and red stone dressings. The roofs will be tiled and there will be a tower at Regent Road corner. The contractors for the works are Messrs. J. and B. Swatman, of Lowestoft.

**MERTHYR.**—The Urban District Council has rejected the report recently presented by the committee appointed to consider the Housing of the Working Classes Act, in which it was recommended that the Council should obtain a loan of £10,500 for the purpose of erecting eighty-four workmen's cottages, at an estimated cost of £125 each.

**MORLEY.**—New premises known as the Aekroyd Street Reading Room, Morley, were opened on Saturday week by the Mayor. The premises, which comprise a committee-room, reading-room, and a large room for social gatherings, have been built by Mr. J. W. Binks.

**MOUNTSORREL.**—The memorial stones of a new chapel and school rooms were laid at Mountsorrel, near Loughborough, on the 10th inst. The new chapel is to take the place of an old building. The site is near the centre of the village, and the line of building has been fixed 30ft. from the roadway. The material for the building is brick, the front being faced with granite stone. Early Gothic is the style of Architecture chosen, and the work will be carried out by Messrs. Scurr and Jowett, of Barrow-on-Soar, from plans by Mr. John Wills, of Derby. The front gable of the chapel will have a circular window with tracery, the gable being flanked with octagonal buttresses that run up and finish with pinnacles and carved finials. Two single light windows to the front are to have cusped heads, but all other windows will be pointed; the glazing throughout being with cathedral rolled glass in lead squares and diamonds. The roof is to be partially open, relieved with arch and panel work. The woodwork for both ceiling and seating of the chapel will be pitch pine. A school room at the rear of the chapel will be 40ft. by 26ft., to accommodate 200 children. There are also to be class rooms, infants' room, and provision for extension by the addition of nine other apartments. The total cost, exclusive of Architect's fee, is stated at £1800.

**PETERHEAD.**—The Street Committee of the Town Council has approved of the following plans:—Proposed alterations by Mr. Thomas Forrest in Maiden Street; two new cottages by Messrs. G. Scott and Sons in Queen Street; of shed, proposed to be erected by the Harbour Trustees in the yard of Messrs. W. and J. Stephen; of alterations by Mr. J. Mason on his property in Queen Street; and an extra exit from the Music Hall.

**SCARBOROUGH.**—Mr. Robson, F.S.A., Architect to the Education Department, who was asked by the Scarborough School Board to judge the plans sent in for the erection of the new Higher Grade School, has made his awards. The first place is taken by Messrs. Hall, Cooper, and Davis, Westborough, Scarborough; the second place by Messrs. Demaine and Brierley, York; and the third by Messrs. Marshall and Dick, Newcastle. Forty sets of plans were submitted. Five sets of plans were sent in by local Architects for the premiums offered—viz., £50 and £25, in connection with the proposed Wesleyan College on the Weaponess Estate, South Cliff. The award has been made, the first premium being awarded to Messrs. Hall, Cooper, and Davis, Westborough, Scarborough, and the second to Messrs. Tugwell and Barry, Westborough, Scarborough.

**SWINDON.**—A chemical laboratory and a secondary day school have been opened at Malmesbury. New technical school buildings are now completed. The cost of their erection and furnishing amount to £12,000. The County Council has contributed £3500, the Science and Art Department £1000, and the Urban District of New Swindon about £7500.

**TROWBRIDGE.**—A grant of £1500 has been made by the County Council in aid of a technical institute for Trowbridge. It is estimated that the cost of building and furnishing the Institute will amount to at least £5000. The local committee have had under consideration the question of a site, but no definite conclusion has yet been arrived at. Negotiations are now being conducted with a view to the acquisition of a site nearly opposite the Town Hall. The present buildings are inadequate, and have been condemned.

**WAKEFIELD.**—A statement presented to the West Riding County Council gives the total estimated cost of the new County Offices at Wakefield, including furniture and fittings, at £108,543. For furniture and fittings the Council will be asked to sanction expenditure amounting to £12,500. The Architects have reported that it will be practicable to open the new offices in November next, although the works will not then be entirely completed.

**WINCHESTER.**—The barracks at Winchester, which were the Rifles' dépôt, are to be rebuilt at a cost of £72,000. The style of the former building, which was copied from that of Versailles, is to be preserved as far as possible, and the adjacent old County Hall is not to be interfered with. The former building was originally built as a palace for Charles II., at a time when he thought of transferring the capital from London to Winchester.

The proposed new offices for the Aberdeen Parish Council are estimated to cost £6000.

The Warwick Board of Guardians has passed a resolution in favour of applying for a loan for £3000 to provide new tramp wards.

The Bournemouth Town Council has decided to abandon the proposal to build a pavilion on the shore end of the pier, and has also instructed their Surveyor to prepare plans for the conversion of the present shelters into a pavilion, at a cost not exceeding £10,000.

The Technical Committee of the West Bromwich Technical Schools has decided to extend the present premises, and to incur an outlay of £1000. The extension is to include the erection of a workshop where students may carry out their own designs in practice.

## Trade and Craft.

### ELECTRIC LIGHTING AT WEST HAM.

The question of electric lighting for West Ham, at a cost of some £20,000, came before the West Ham Council recently. The tender of the Electric Construction Company, Limited, was rejected, and a higher tender was accepted. The company then alleged that they had been previously approached by the representative of one of the members of the Council, and that certain private offers were made by this representative. The company stated that they declined to listen to these overtures. They demanded an investigation. The Council pointed out that the company had not named the persons against whom they brought this serious charge, but ultimately it was arranged that the Council should apply for a Local Government Board inquiry, and the company thereupon undertook to reveal all the facts at this inquiry.—In the House of Commons Mr. Chaplin last week stated that the Local Government Board had no power to order an inquiry into this matter, but the firm might prosecute or communicate with the Public Prosecutor.—Mr. Henry F. Joel (of the firm of Messrs. Henry F. Joel and Co.) has now written to the local press stating that his company also are not satisfied as to the fairness of the West Ham Council in the matter of electric lighting contracts, and stating that in 1893, and again in 1894, Messrs. Joel tendered at £1045 for electrically lighting the public hall and free library at Canning Town, but a higher tender was accepted. There is a strong local feeling that the whole matter should not be allowed to rest in this unsatisfactory state.

### A NEW PAVING STONE.

A new paving stone, said to be of better wearing quality than any of British origin, is attracting notice. It comes from Quenast, in Belgium, and Prof. A. B. W. Kennedy reports the results of compression tests of four small blocks of Aberdeen, Guernsey, Leicester, and Quenast paving stone as very markedly in favour of the last-named. Prof. James Geikie, of Edinburgh, too, gave a report, and thinks that Quenast stone is both harder and tougher than Scottish granites or North Country whinstones, and likely to be more durable for street service.

### EASTBOURNE BUILDING BYE-LAWS.

John Vinall, jun., builder, of Eastbourne, appeared in answer to three summonses taken out at the instance of the Eastbourne Corporation, charging him with having contravened the bye-laws of the Town Council by unlawfully allowing No. 1, North End, Western Road, Eastbourne, to be occupied as a dwelling-house, the same not having been certified as fit for habitation by the Local Authority; by erecting a scullery of a lesser height than 9ft.; and by failing to provide a ventilating shaft and window in the water-closet. The third of these summonses was withdrawn on the payment of costs, the work required to be done having been executed.—William Chapman Field, Building Surveyor to the Eastbourne Town Council, stated that in May last plans were submitted by the defendant for six cottages in Western Road. In these plans the scullery referred to in the summons was shown to be 9ft. in height, the floor being 9in. above the level of the yard. When, however, the houses were completed he found the scullery to have been erected 7ft. 6in. in height, and that the flooring was 4in. below the level of the yard and below the level of the intercepting trap of the drain. He had not certified the houses as fit for human habitation, but nevertheless the defendant had permitted two of them to be occupied. On the application of the defendant the Building Committee had agreed to allow the defect as to the scullery to be remedied by lowering the level of the floor; but on finding that the floor level was already below that of the yard, the Committee withdrew this permission.—It was stated that to remedy the defect as to the scullery it would be necessary to reconstruct the rear portion of the house at a cost of between £50

or £60 in each instance.—The magistrates having viewed the property, adjourned the matter for a fortnight to give the Building Committee an opportunity of meeting and considering any suggestion from the defendant whereby the defects might be overcome.

#### A GUNPOWDER MOTOR.

According to the New York Herald, the latest idea in motor cars is the gunpowder motor. It is to be run by a motor which, with a weight of 8½lb. and a length of 8in., will, when charged with ordinary gunpowder, carry a machine and rider 100 miles. The small cylinder of the motor is 3in. long and 1in. in diameter. At the forward end is the exploding chamber. This is 2in. long, 1½in. high, and 1½in. wide. From the rear end projects the driving rod. Above the cylinder is the powder magazine, 4in. in diameter and 2in. deep. It is from this magazine that the explosive is supplied, by means of a feeder, to the exploding chamber below. As the explosion occurs a gaseous smoke is generated, which acts much the same as steam, in that it operates the piston head of the driving rod within the cylinder, one end of which is connected with the exploding chamber. To avoid any possibility of the explosion of the gases generated by the powder, there is a valve at the top of the exploding chamber, through which the excess of gas is automatically allowed to escape. The speed of the machine to a certain extent regulates the action of the valves in the supply chute. When starting, the powder is exploded first by concussion. The rod is forced down, the valves in the chutes are opened, and a cap within the chamber is exploded, causing the machine to start. Just the reverse operation brings the machinery to a stop. The drawing upward of the rod closes the valve, causing the flow of powder to cease, and as no more gaseous smoke can be generated, the machine comes to a gradual stop.

#### A DIAMOND JUBILEE PANEL.

We understand that Messrs. Stanley Bros., Limited, of Nuneaton, are manufacturing a special panel in commemoration of Her Majesty's record reign. The panel is being made in buff and red terra-cotta and in glazed ware. The design, which bears a representation of Her Majesty and the words "Victoria, sixty years Queen of Great Britain and Ireland," with other suitable lettering, is very neat, and will, Messrs. Stanley think, largely recommend itself for introduction into Jubilee Memorial Buildings, which are being so numerous erected throughout the country. The panel has the recommendation of cheapness. In buff and red it is obtainable for 20s., and in glazed ware for 40s.

#### CLAIM FOR DAMAGE.

The plaintiff in the action of Maynard v. Thompson and Others, which recently came before Mr. Justice Hawkins and a special jury, was a dining-room proprietor, at 27, Holloway Road. The defendants were his landlords and also the owners of the adjoining house, No. 29. The plaintiff's claim was for damage which he alleged had been caused to No. 27 by defendants' negligence in pulling down and rebuilding the house adjoining. The defendants said that they had been guilty of no negligence, and had acted under the orders of the County Council. They counter-claimed for damages for breach of covenant to repair and for £11 2s. for rent and insurance. Messrs. Sabey and Sons, the builders who had actually carried out the work, had been added as third parties.—Mr. James Maynard, the plaintiff, was called, and said that on Sept. 29th, 1884, he took an assignment of a lease of 27, Holloway Road. No. 27 was bounded on the north by No. 29. Both houses were old. In 1894 No. 29 was pulled down. This caused a number of large cracks in the plaintiff's wall. Afterwards a new house was built at No. 29, there being a narrow space left between it and No. 27. Struts were placed between the two houses. Then a large hole made its appearance in plaintiff's wall. Plain-

tiff said he had suffered loss in his business owing to the state into which the premises had fallen, and that finally he had to leave them owing to their unsafe condition.—Counsel's contention was that the house had fallen into disrepair by reason of age and plaintiff's breach of his covenant to repair, and that this was the cause of the business being carried on at a loss.—Evidence was given at considerable length on behalf of the third parties in order to disprove the plaintiff's claim.—In the result the jury found that the plaintiff had suffered no loss in consequence of the premises being pulled down, and that the defendants were entitled to £11 2s. rent and £10 for dilapidations.—On this his Lordship gave judgment for the defendants on the claim and counter-claim.

## Correspondence.

#### LONGTON TECHNICAL SCHOOLS AND FREE LIBRARY.

[To the Editor of THE BUILDERS' JOURNAL.]

SIR,—We have read your article on the above with amazement, and cannot imagine how a professional journal can try to bring discredit upon the Longton Town Council when it is plain to see that everything was done that could be, to make the competition fair and above board. What are the facts?

1st. The conditions were clear and defined. All designs to be sent in under motto.

2nd. The designs were adjudicated upon by an able London Architect, a F.R.I.B.A.

3rd. His report was submitted and approved by the Town Council without the identity of the authors being known.

4th. The Council then decided to confer with the successful Architect and the County Director of Technical Instructions.

This seems all clear and square; then why call the "competition unsatisfactory." No doubt it would have been very satisfactory if the Council had set aside the assessor's report and adopted some other design!

Locally, we may tell you, the competition is considered eminently satisfactory, and we have had the congratulations of a leading Architect, a F.R.I.B.A., who, after viewing the designs, distinctly said we had "won on our merits," and an examination of the designs when on public view plainly proved this.

No doubt every effort will be made locally to oust us from the work, as is indicated in a letter to the local press, evidently the contribution of one interested and disappointed, but we certainly expected fairer treatment from a professional paper, and we think there is something due to the assessor, Mr. Scott.

We cannot attempt to follow your criticism of our designs, as it is so obviously misleading and absurd. We can only say this is not the first technical building we have designed and erected, and we know our subject well, and have no fear of the result. We are also conscious of points in our design which we could improve, but the conditions of the competition prevented an alteration, and we trusted to having an opportunity, if successful, of dealing with them when we are in touch with the Building Committee.

One point we may just refer to. The object of your article is to rob us of the merit of our success, and to attribute it solely to cost. This is entirely wrong. We have not seen the Assessor's report, but we are assured by the Town Clerk that this is not so. On merit alone have our designs been selected, with the additional advantage that they are much nearer the stipulated cost than any others.

We are aware that having carried off both premiums, there has been weeping and wailing and gnashing of teeth, but we trust the BUILDERS' JOURNAL will rise above petty local jealousy and support a Town Council in doing the right thing "in these degenerate days of 'unfair competitions.'"

We are sorry to trouble you, but your article casts such a reflection upon us, the Town Council, and the Assessor, that we felt it necessary to put the plain facts before you.

Yours truly,

WOOD & HUTCHINGS.

## SOCIETY MEETINGS.

**British Archaeological Association.**—At the seventh meeting of the session, held at Sackville Street, Piccadilly, Mr. Compton, vice-president, in the chair, a paper was read by Mr. Thomas Blashill on "Some Certificates as to Recusants in Holderness." The inconvenience and discomforts our forefathers in the early years of the seventeenth century were subjected to when they refused to attend religious worship in the Churches was curiously exemplified in the many original documents exhibited in illustration of the paper, all of which were about the same date, A.D. 1616. These certificates shed considerable light upon the operation of the law in the centre of Holderness, which at that time was by its remoteness and by the absence of good roads more than usually secluded from the outside world.—In the discussion following the paper, the Chairman, Mr. Rayson, Mrs. Collier, Mr. Patrich, and others took part.

**London and Middlesex Archaeological Society.**—The members of the London and Middlesex Archaeological Society met at the London Institution on the 10th inst., under the chairmanship of Dr. Freshfield. The proceedings of the evening were opened by the inspection of the recent finds in Threadneedle Street in the course of excavations for the Central London Railway. In addition to the specimens of ancient ware that were the subject of a lecture a few weeks ago by Mr. Welch, Guildhall librarian, several fine examples of the potter's art, it appears, have been unearthed, and have found a home in the Guildhall Museum. The principal find, and one that is regarded as extremely valuable, is that of a graceful and delicate goblet of Venetian glass. It was unearthed in an old well about 16ft. below the surface. Accompanying it were a little money-box of glazed buff ware and a Delft plaque, the latter being ornately painted in a design of blue, green, orange, and yellow. A somewhat imperfect specimen of the Bellarmine, in glazed stone ware, was also turned up. It has lost the neck, which formerly bore a reproduction of the features of Cardinal Bellarmine, after whom the jug was named. The body of the jug bears an armorial medallion, a shield, and other devices. Another very interesting exhibit was an old beadle's staff head in silver, which had been sent to Mr. E. H. Freshfield from the Birmingham Assay Office, whither it had found its way.

**The Builders' Association.**—The annual dinner of the Dublin Master Builders' Association took place recently. The Right Hon. Alderman Meade presided.—Sir Charles Cameron, in proposing the toast of "The Master Builders' Association," said from what he knew of the Association of Master Builders he could say it was composed of Craftsmen of the highest order. Just as the great profession of Law was divided into the classes of solicitors and barristers, so this great profession of the building Art was divided into the profession of Architects and builders.—Alderman Meade responded. He said that as an association they were face to face with a very serious condition of affairs in the spring of last year, and during that time the work of the association had been well and satisfactorily done. They had drawn up a satisfactory system of working, and the men were now working with a better heart than before the strike, and under such rules as would, in his opinion, make it unlikely that they would hear of a strike again for many a long year. They also hoped to have rules adopted between the builders and Architects, which would probably put an end to those little differences which sometimes culminated in the law courts; and he was sure when that was done there would be a court of appeal between the builders and the Architects that would be able to settle all differences.

**Sheffield Society of Architects and Surveyors.**—The monthly meeting of the Sheffield Society of Architects and Surveyors was held on the 11th inst., the president, Mr. C. Hadfield, F.R.I.B.A., in the chair. A lecture

was given by Mr. J. B. Mitchell-Withers, A.R.I.B.A., on "A Tour in Holland," which we shall have the pleasure of publishing in an early issue.

**Dundee Master Builders' Association.**—The annual dinner of the Dundee Master Builders' Association was held on the 4th inst. Mr. John F. Shaw, the president, occupied the chair. In proposing "The Building Trade," Mr. Paul said the building trades of the city had for some time been very prosperous, and it was a pleasure to think that, for a considerable time to come, there was likely to be as prosperous times for these trades. Within the past fortnight applications had been made to the Town Council for the opening up of four or five new streets in Dundee, which showed there was to be a considerable boom in the building trade for a year or two. The Chairman, in responding, acknowledged that the building trade had been very prosperous during the past year, and said if the labouring classes were not making money just now they ought to be. When he came to Dundee about forty years ago he worked sixty hours per week for 16s., and he was now paying men £1 16s. for fifty-one hours. Provisions

were as cheap now as they were then, but house rents were dearer. About forty years ago they would have got two rooms in Dundee for £5 or £5 10s., but they would now have to pay £8 or £9 for that accommodation. There was no doubt that the high wages paid to the men in the building trade raised the prices of property, but there were many trades in the city in which the wages had not risen in the same proportion. However, he hoped that good trade would continue, for there was nothing more satisfactory to masters and men than that there should be plenty of work.

**South Staffordshire Institute of Iron and Steel Work Managers.**—Mr. F. W. Burstall, M.A., A.M.I.C.E. (Professor of Engineering, Mason College, Birmingham), recently read a paper on "The Mechanical Testing of Iron and Steel" to the members of the South Staffordshire Institute of Iron and Steel Works Managers at Dudley. Mr. W. Yeomans presided. The paper dwelt mainly with the practical side of testing, and stated that the first testing machine was for testing chain cables, and capable of pulling 100 tons. The Admiralty, in 1831, not willing to trust to chainmakers' tests, put down one of their own. This was the parent of all English modern testing machines, and all the older

machines contained all the essential points of modern firms.

**Liverpool Engineering Society.**—At a meeting of the Liverpool Engineering Society, held on the 3rd inst. at the Royal Institution, Mr. S. B. Cottrell, president, in the chair, a paper was read by Mr. William Brodie on "Dock Gates." The lecturer mentioned that the old Liverpool dock was constructed in 1709, but that dock gates might have been constructed much earlier if required, as gates were used for canal locks in Europe as early as the fourteenth century. A novel and very special form of gate was that in use at Messrs. Clover, Clayton, and Co.'s yard, Birkenhead, consisting of an iron frame approximately rectangular, covered with sheet iron, and turning on a horizontal hinge in the bottom of the entrance. The clapping faces of the gates were formed of pitch-pine baulks, with india-rubber sheeting to ensure watertightness, and the gates were opened by being lowered by wire ropes into a horizontal position outside the sill, and below its level. The gates of the Canada 100ft. lock were instanced as a notable example of gate construction, they being the widest ever constructed.

**Institution of Junior Engineers.**—The third annual conversazione of the Institution of Junior Engineers was held on Saturday

Free from shakes, equal in colour and appearance to Portland, Mansfield, other stone. Weathers perfectly.

Catalogues, Estimates, and further particulars for the consideration of Architects and others

week at the Westminster Palace Hotel. In the great hall there were models of a transverse section of the Blackwall Tunnel, with an excavating shield, also a diagram of longitudinal section; of excavators, gun-carriages, loading gear, electric motor rudder, a South-Western Railway locomotive, and of the screw steamer "Hawarden Castle." Through the courtesy of the Electrophone and the National Telephone Companies, the members and their friends were enabled to hear what was going on at various theatres. Mr. R. W. Paul gave an excellent display of animated photographs, which, it was stated, passed over the screen at the rate of 2000 per minute. Mr. W. J. Tennant took the engineers a journey in fancy, by means of a magic-lantern, through Ireland; and Mr. D. T. Keymer, with larger enterprise, conducted the assembly round the world in twenty minutes.

### CONTRACTS OPEN.

#### COUNTY BOROUGH of MIDDLESBROUGH.

**NEW CEMETERY LODGE.**  
The Cemeteries Committee invite TENDERS for the ERECTION and COMPLETION of an ENTRANCE LODGE at the New Cemetery, Linthorpe.

Plans and specifications may be seen, and quantities obtained, at the Office of Mr. FRANK BAKER, C.E., Borough Engineer, Municipal Buildings, Middlesbrough, on payment of One Guinea, which will be returned on receipt of a bona-fide Tender with the bills of quantities fully priced out and schedule prices duly filled up.

Sealed Tenders are to be delivered at the Town Clerk's Office not later than FIVE p.m. on MONDAY, MARCH 22nd, endorsed "Tender for Cemetery Lodge."

The Corporation do not bind themselves to accept the lowest or any Tender.

By order,  
FRANK BAKER, C.E., F.G.S.,  
Borough Engineer.

Municipal Buildings,  
March 8th, 1897.

#### COUNTY BOROUGH of WEST HAM.

**TO BUILDERS AND CONTRACTORS.**  
The Council hereby invite TENDERS for the ERECTION of SEWAGE PUMPING ENGINE and BOILER HOUSES and ELECTRIC LIGHTING BUILDINGS, at the Abbey Wharf, Stratford, London, E.

Plans may be seen, and specifications, form of Tender, and further particulars obtained, on and after the 24th inst., at the Office of Mr. LEWIS ANGELL, Engineer to the Corporation, Town Hall, Stratford, E., on the deposit of a £5 Bank of England Note, which will be returned on the receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Buildings," to be sent to my Office not later than FOUR o'clock on TUESDAY, APRIL 13th, 1897.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract.

In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,  
FRED. E. HILLEARY,  
Town Clerk.

Town Hall,  
West Ham, E.  
March 9th, 1897.

#### EGYPTIAN GOVERNMENT.

**MINISTRY OF PUBLIC WORKS.**  
ADJUDICATION for the CONSTRUCTION of TWO BUILDINGS for the Native Tribunals, the Prison, and the Police Barracks, on the site of the old Mansour Pacha's Palace in Cairo.

TENDERS will be received at the Offices of the "Service Administratif," Ministry of Public Works, Cairo, up to TWELVE noon on the 3rd of MAY next, for the CONSTRUCTION of the above BUILDINGS.

Persons wishing to Tender for this work can consult the specifications and the conditions of the Adjudication on all days, except Fridays and general holidays, from EIGHT a.m. to ONE p.m. at the Offices of the "Service Administratif."

Tenders received at the Ministry later than the date mentioned above, as well as those that are not in conformity with the form prescribed by the specifications, will be rejected.

Each Tender must be accompanied by a provisional

security deposit of £E500\*, which will be kept in the Egyptian Government Treasury until a decision has been arrived at with regard to the Adjudication. These deposits will then be returned to the persons whose Tenders are not accepted, while the party to whom the work is awarded will, on the signature of the contract, increase the above deposit up to the amount of the permanent deposit fixed by the specifications.

The provisional deposit shall be paid either in cash or in Egyptian Bonds, calculated at 10 per cent. below their current price. No interest will be paid on cash deposits, but the depositing party has a right to the coupons due, when the deposit is in Egyptian Bonds.

The Ministry of Public Works reserves to itself the right of not accepting any Tender whatever, and can accept any Tender, though it may not be the lowest made.

\*The sterling pound is worth £E0.975, and the French piece of 20 francs £E0.770.

### TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**ARKLEY.**—For new chancel, St. Peter's Church, Arkley, near Barnet. Mr. J. C. Traylen, Architect, 16, Broad-street, Stamford:—

COMPLETE LIST OF CONTRACTS OPEN—continued.

DATE OF DELIVERY.	WORK TO BE EXECUTED.	FOR WHOM.	FROM WHOM FORMS OF TENDER MAY BE OBTAINED.
<b>ROADS—continued.</b>			
March 20	Cartage of Stone, Leicester	County Council	J. W. Shaw, Surveyor, Oadby.
" 20	Broken Granite, Limestone, &c., Repton (Derbyshire)	Rural District Council	C. F. Chamberlin, Union Office, Burton-on-Trent.
" 20	Street Works, Stone (Staffs.)	Urban District Council	S. Watson, Westbridge-road, Stone.
" 20	Hauling Materials, Wootton Bassett (Wilts.)	Rural District Council	Mr. Avenell, Surveyor, Parton.
" 20	Carting of Material, Huntingdon	Rural District Council	M. L. Lewin, District Surveyor, Newtown, Huntingdon.
" 20	Materials, 1 Year, to March 31, 1898, Middlesbrough	Rural District Council	W. H. Dixon, Surveyor, Kirby Carlton, Northallerton.
" 20	Making-up Carriage-way, &c., Surbiton	Urban District Council	S. Mather, Victoria-road, Surbiton.
" 20	Street Works, Bury (Lancs.)	Corporation	Borough Engineer, Bank-street, Bury.
" 20	Cartage, Beverley	Corporation	Gas Manager, Beverley.
" 22	Paving, &c., London, S.E.	Bermondsey Vestry	F. Sumner, Town Hall, Spa-road, Bermondsey.
" 22	Street Watering, Carting, &c., Maidenhead	Urban District Council	Borough Surveyor, Town Hall, Maidenhead.
" 23	Road Materials, 1 Year, to March 31, 1898, Heavitree (Devon)	Urban District Council	J. W. W. Mathew, Clerk to the Council, Heavitree.
" 24	Carting Road Material, Pottersbury (Northants.)	Rural District Council	X. A. Endors, Surveyor, Yardley Gobion, Stony Stratford.
" 24	Sewerage, Making up, &c., Snodland (Kent)	Investment Company, Limited	G. W. Cobham, 49, Windmill-street, Gravesend.
" 24	Granite and Slag, Stony Stratford	Rural District Council	X. A. Endors, Surveyor, Yardley Gobion.
" 24	Granite, 1 Year, to March 31, 1898, Wigston Magna (Leics.)	Urban District Council	Surveyor, 32, Bell-street, Wigston Magna.
" 24	Carting Granite, 1 Year, to March 31, 1898, Wigston Magna (Leics.)	Urban District Council	Surveyor, 32, Bell-street, Wigston Magna.
" 24	Making up and Paving Road, Fulham	Vestry	C. Botterill, Town Hall, Walham Green.
" 27	Granite (15,000 tons), Aylesbury	Bucks County Council	R. J. Thomas, County Hall, Aylesbury.
" 27	Carting Road Material, 1 Year, to March 31, 1898, Chester	Cheshire County Council	County Surveyor's Office, Castle, Chester.
" 27	Materials, 1 Year, to March 25, 1898, Colne (Lancs.)	Highways and Sewers Committee	T. H. Hartley, Borough Surveyor, Colne.
" 27	Flints, 1 Year, to March 31, 1898, Warminster	Rural District Council	R. H. Bourne, Crookerton, Warminster.
" 29	Road Material, 1 Year, to March 31, 1897, Macclesfield	Rural District Council	Assistant Clerk, Union Offices, Macclesfield.
" 29	Granite, &c., Beckenham	Urban District Council	J. A. Angell, Council Offices, Beckenham.
" 30	Street Works, Dover	Corporation	Borough Engineer's Office, Town Hall, Dover.
" 30	Tar Paving Footpaths, Southampton	Corporation	W. B. G. Bennett, Borough Engineer, Southampton.
April 5	Granite (300 tons), East Dereham	Council	H. G. Himson, Surveyor, Theatre-street, East Dereham.
" 6	Sewering, Levelling, &c., Mansfield (Notts)	Corporation	F. Vallance, Borough Surveyor, Mansfield.
<b>SANITARY—</b>			
March 19	Sewerage Works, Denton (Lancs.)	Urban District Council	G. H. Newton, Council Offices, Market Place, Denton.
" 19	New Sewer, Hull	Guardians	Freeman, Son, and Gaskell, Albert Chambers, 11, Carr-lane, Hull.
" 20	Sewerage Works, Mangettsfield (Gloucestershire)	Rural District Council	W. L. D. Maitre, Bank Chambers, Staple Hill, near Bristol.
" 22	Cast-iron Pipe Sewer, Bury	Sewage Committee	J. Cartwright, Borough Engineer, Bury.
" 22	Labour for Sewering, Whitefield (Lancs.)	Urban District Council	T. Thorpe, Knowsley-street, Whitefield.
" 22	Scavenging, 1 Year, to March 31, 1898, Bridlington	Urban District Council	F. Reed, 15, Hilderthorpe-terrace, Bridlington.
" 23	Sewers, Lewisham	Board of Works	Board of Works Office, Catford, S.E.
" 23	Sewerage Works, Poulton-le-Fylde (Lancs.)	Rural District Council	Hinnell and Murphy, 41, Corporation-street, Manchester.
" 25	Sewers, &c., Hayland Nether (near Barnsley)	Urban District Council	W. Farrington, Surveyor, Hyland.
" 25	Sewerage Works, Sandgate	Urban District Council	A. R. Bowles, Engineer to the Council, Sandgate.
" 25	Sewer (600ft.), Barnstaple	Corporation	J. Bosson, Municipal Buildings, High-street, Barnstaple.
" 27	Pipe Sewers, Gloucester	Rural District Council	J. F. Trew, Council Chambers, Gloucester.
" 29	Drainage and Plumbing Works, Stone, Staffs.	Guardians	J. J. Chapman, Architect, Stone.
" 30	Glazed Stoneware Pipe Sewers	Brick and Tile Company	W. Harmer, 137, London-road, Southborough.
April 1	Main Drainage Works, Sumbury-on-Thames	Urban District Council	J. Anstie, 17, Victoria-street, S.W.
" 2	Main Drainage Works, Ashby-de-la-Zouch	Rural District Council	J. B. Everard, 6, Millstone-lane, Leicester.
July 31	Sanitary Improvement Works, Oporto, Portugal	Corporation	Municipal Town Hall, Oporto.
<b>TIMBER—</b>			
March 22	Sleeper Blocks (30,000 to 35,000), Dundalk	G.N. Railway Company	T. Morrison, Amiens-street, Terminus, Dublin.

COMPETITIONS.

DATE DESIGNS TO BE SENT IN.	DESIGNS REQUIRED.	AMOUNT OF PREMIUM.	BY WHOM ADVERTISED.
March 17	Plans for Extension of Workhouse, &c., Swansea	£10 10s.	Guardians.
" 20	Designs for Town Hall, Enniskillen (co. Fermanagh, Ireland)	£50, £20, £10	Commissioners.
" 31	Railway Stations, Christiania	Kroner 10,000, 4000, 2000, 1000	Railway Offices, Department of Public Works, Victoria-terrace, No. 6, Christiania.
" 31	Designs for Public Halls and Municipal Offices, Govan		Commissioners of the Burgh.
April 17	Plans and Designs for Assembly Hall, &c., Guernsey	£100, £50	States of Guernsey.
" 21	Competitive Schemes for Water Supply, Long Buckley, Northamptonshire	30 guineas	Rural District Council.
" 30	Designs for Police Station and Court House, Halifax	£50, £25	Corporation.
July 1	Designs for Water Supply, Elne (France)		La Mairie, Elne, Pyrénées Orientales.
No date.	Design for Nurses Home, Wandsworth and Clapham Union.	£52 10s., £21, £10 10s.	Guardians.

## THE PRACTICAL DESIGNING OF IRON AND STEEL ROOFING.

BY ALEXANDER DREW.  
(Continued from page xvi.)  
No. III. OF SERIES.

BEFORE proceeding further with the application of this graphic method of drawing Stress Diagrams, it may be well to consider the second method of calculation mentioned, that of the Method of Moments. As previously pointed out (see Figs. 13 and 14), the moment of a force about any point is equal to the value of the force multiplied by its perpendicular distance from that point; also that two or more forces will produce equilibrium about any point in their plane of action if the algebraic sum of their respective moments about that point is equal to zero; again, if the turning-point be taken in the line of action of any force, the moment of that force is equal

to zero. These various facts are made use of in this Method of Moments in determining the stress on the several members of the roof truss, and a reference to Fig. 18 will further explain these facts. Three forces, A, B, and C, are shown as acting at the one point, and they are assumed to be in equilibrium, or balanced. If any point X be chosen in their plane of action, the moment of these three forces about this point will be equal to zero; that is to say,  $A \times l$  added to  $B \times m$  (these two forces tending to turn in one direction round the point X), will be exactly equal to the forces C multiplied by the perpendicular distance n (this latter force having an opposite turning tendency to the others). Now if one of these forces be known, and either of the others required, it is only necessary to choose any point in the line of action of the one of the unknown forces, and take moments about this, to get at the desired value of the other. The known force multiplied by its perpendicular distance from this assumed point gives the value of its moment, and if this be divided by the perpendicular distance of the line of action of the force which it is desired to

determine from this same point, the value of this unknown force will be at once got at, because (as noted with reference to Fig. 14) the two moments must balance, or be equal to one another, about this point.

In Fig. 19, one-half of a similar roof truss to that shown in Figs. 16 and 17 is sketched, and the two sets of external forces (the Dead and the Live Load forces) are marked in position. To simplify matters it is advisable in the first place to combine the several forces acting at the three joints in the rafter. This is shown by the dotted lines, and is gone about in exactly the manner illustrated and described by Fig. 9; two individual forces being taken, and the resultant of this found by means of the parallelogram of forces. In the case of the four forces acting at the shoe, these are at once reduced to two by using the resultant of each of the pair which act in the same straight line, and drawing the parallelogram with these. In this way three single forces are left, one of 59cwt. acting upwards at the shoe, a downward force of 49cwt. at the centre of the rafter, and one of 38½cwt. at the apex; the directions of action of these being as shown. In applying this Method of Moments imaginary section lines are taken, dividing the truss through two, or at most three members. In the case under consideration it is necessary to use three section lines to determine all the stresses on one half of this truss; the lines chosen are X X, Y Y, Z Z. Fig. 20 shows the lower portion of this truss, the part to the left of section line X X is not considered at this stage. Turning for a moment to the complete truss with its full dead and live loads acting on it, it will be readily understood that if it were possible to build up the complete portion of the truss to the right of the line X X in a solid wall of concrete or masonry, this operation, if carefully done without interfering with the external forces acting on the truss, would not alter the stresses on the rafter and tie to the left of this line X X: by an imaginary arrangement of this kind, the small portion left projecting beyond the wall might be considered as a bracketed roof resisting a force of 59cwt. acting upwards in the direction shown; this resistance being due to some unknown stress in the rafter and

the tie. By the Method of Moments, were the stresses known in rafter and tie, the moments of these stresses and that of the force of 59cwt., about any point in the plane of action of these forces, would be equal to zero. Could one of these unknown forces or stresses be got rid of, the other could be readily determined (see

Fig. 14), and, as has been previously pointed out, it is easy to do this by choosing the turning point in the line of action of one of these unknown forces. Thus if the stress in the tie be required, the turning point is taken somewhere in the line of the rafter, say at the point M; the moment of the force of 59cwt. about this point is equal to the value of that force multiplied by its perpendicular distance from M; and to balance this, there is the stress or force exerted by the tie multiplied by its perpendicular distance from this same point. Measuring these distances to scale, it is only necessary to solve the simple sum here noted to get at the required result.

$$\text{Stress in Tie} = \frac{59 \times 7.2}{2.9} = 146.5 \text{ cwt.}$$

In a similar manner the stress or force in the Rafter is got by taking moments about N, thus:

$$\text{Stress in Rafter} = \frac{59 \times 6.3}{2.4} = 154.9 \text{ cwt.}$$

If the stress in the strut is now required, the new section line Y Y has to be taken such that it passes through this member (see Fig. 21). In moving backwards to this new section line, a second external force is introduced into the figure, that of 49cwt. acting downwards. As the stress on the strut is required, the turning point must now be chosen so as to get rid of the moments of the stresses in Rafter and Tie; that is to say, the point must be at the intersection of these two members, at O. In taking this point, which is also in the line of action of the upward forces of 59cwt., we get rid at the same time of the moment of this force, and are

thus left with the single external force of 49cwt. to consider. In the same way as before, the moment of this latter force about the point O, divided by the perpendicular distance of the strut from this same point, gives the stress required thus:

$$\text{Stress in Strut} = \frac{49 \times 8.5}{8.9} = 46.7 \text{ cwt.}$$

The two last members to be considered are the Centre Tie and the Queen Rod, and for these the third section line Z Z must be used (see Fig. 22). Taking the Centre Tie first, the turning point here must be in the line of action of the forces in Rafter and Queen Tie, the point must be at the apex P. There is now the two external forces of 59cwt. upwards, and 49cwt. downwards, to be considered; and for the first time it is necessary to note the direction of the

moments of these, whether they be left-handed or right-handed. The moment of the former force is equal to 59cwt. multiplied by 16.9ft., and that of the latter 49cwt. multiplied by 8.5ft., but their tendency is to turn the framework in opposite directions round the point P; thus the value of the smaller moment must be subtracted from that of the larger, to get at the Resultant Moment; and this value, divided by the perpendicular distance of the Centre Tie from the point P, will give the desired stress, thus—

$$\text{Stress in Centre Tie} = \frac{(59 \times 16.9) - (49 \times 8.5)}{7.3} = 79.5 \text{ cwt.}$$

For the Queen Rod, the turning point must be in line of action of the forces in the other two members cut by the section line, and that point is got by producing the line of the Centre Tie, as shown in dotted lines, till it intersect the rafter at the point Q. Here it will be noticed that the tendency of the two external forces is to turn the framework in the same direction round this new point Q, so that the values of their moments must be added together, and the sum divided by the perpendicular distance of the force in the Queen Tie from the point Q. This perpendicular distance is got by producing the line of the Queen Tie as shown, and is equal to 6.4ft.; the equation thus becomes—

$$\text{Stress in Queen Tie} = \frac{(59 \times 1.2) + (49 \times 7.5)}{6.4} = 68.5 \text{ cwt.}$$

By noting the direction of action of the moments in these several equations just given, the quality of the stress in the member under consideration (whether it be a strut or a tie) may at the same time be determined; but as a little thought and attention will make this clear to any one, it is not necessary to take up time in elaborating this point.

The detailed explanation just given will apply to any type of truss, or condition of loading, the only difficulty that may arise will be in determining the correct section line (which it may be noted does not necessarily require to be a straight line, but may in some cases be curved), or the correct turning point around which to calculate the moments of the several forces. In ordinary circumstances there should be little difficulty in this, if it be borne

in mind that under all ordinary conditions the section line should not cut through more than three members, and that the turning point must be taken at the intersection of the line of action of the forces in two of these members, so as to get rid of their moments, leaving the moment of the third to be equated with that of the known moment due to the external forces.

Returning again to Figs. 16 and 17, where the Graphic Method was illustrated, it is not necessary to draw separate diagrams for the dead and live load; if desired these may be combined, as in Fig. 23. Here the various operations gone through are exactly similar to those already described in connection with the two figures previously noted, so that a detailed description is unnecessary. It will be noticed in this case, that in working round the skeleton diagram to complete the Polygon of External Forces, the different lines being at varying angles with one another, and not all paralleled, as was the case Figs. 16 and 17, the result is now an open Polygon. The lines drawn parallel to the several members of the truss are, as before, drawn from the corresponding points of this Polygon, and in every respect the treatment is exactly what has been previously described.

Should the type of truss be one likely to be made use of at another time, and probably under different conditions of loading, it is advisable to draw the two independent diagrams for the dead and the live loads; and in such a case as this the load assumed in both cases should be equal to one, or unity, so that the various lengths representing the stress on the several members will give multipliers, which can be used for any value of dead or live load; this point will be brought out more clearly further on. Should the truss be of a special type, and not likely to be of service again, it would probably be quicker to draw the combined diagram at once; although such a diagram may appear complicated, it is not so in reality, and with reasonable care should be drawn accurately and quickly.

While considering the question of drawing stress diagrams, it might be well to give a word of warning in connection with Wind Stresses. In the case of some large roofs, one shoe is occasionally set on rollers, to allow for expansion and contraction; but for all ordinary cases, such as are being at present considered, there is no necessity whatever for this arrangement. Circumstances, however, might arise in ordinary practice where the condition is practically identical with that of the truss on rollers; for if a truss be fixed by one shoe to a strong wall, and the other shoe be resting on a high or light column, this latter end is in practically the same condition as if it were free, or supported on rollers. In the cases already considered, it has been assumed that

the supports are two strong walls, or are two pillars; but in the case of a truss with one free end, and situated such that the wind has access to either side, it is absolutely necessary that a double Wind Stress diagram be drawn. This is brought out forcibly by a consideration of Figs. 24 and 25; in the former the wind is assumed as acting on the free end side of the truss, in the latter case on the fixed end side, and the two diagrams accompanying these figures show the variations in stress due to this alteration in direction of wind. The rafter stresses do not vary to any great extent, but the main tie has very different stresses in these two conditions, the variation being roughly from 34cwt. to 58cwt.; the higher value arising under the condition shown in Fig. 25. Perhaps a word of explanation as to how these diagrams, Figs. 24 and 25, have been drawn, may not be amiss. The condition of affairs at the free end necessarily implies that the reaction at that point can only be in a vertical direction. Now let the resultant of the wind pressure acting on the one slope of the roof be taken (which in this case would be a force of 45cwt. acting in the centre, and normal to the slope, of the windward rafter), and let the line of action of this force be produced till it meets a vertical line drawn from the point of the windward shoe (these intersecting points are marked O in the two diagrams), then join the fixed end shoe point and this point O by means of a straight line. This last drawn line will give the direction of action of the reaction at the fixed shoe; if now the wind pressure resultant be assumed as acting at this point O, it may be readily resolved by means of the principle of the parallelogram of forces (previously described) into two other forces acting in the direction of the lines joining the point O with the two shoes; and this being done, it is only necessary to imagine these two forces as moved back to the shoes to get the desired reactions there. This being settled, the two diagrams shown can be drawn without any difficulty.

Time will not allow at present of further examples being taken to illustrate the application of these methods of calculation (this subject may be touched upon further on, when the various type of roof are under consideration), but sufficient has been said to enable anyone to continue the study, and this cannot be better carried out than in some such systematic manner as that of choosing one type of truss, and working out the manner in which the stress on the several members vary as this type is modified, either by altering the rise of the rafters, or by varying the rise of the tie. By so doing many interesting points will arise, and the experience so gained cannot but be extremely useful in the future. I propose treating one simple type of truss in

Fig. 24.

Fig. 25.

this way; but to enable the investigation to be carried out to its full extent, it will be best to defer this treatment till some methods of determining the sections required in the various members to withstand the stress to which they are subjected, have been indicated.

In attempting to determine the necessary section for the several members of a roof truss, the first question which naturally requires to be settled is the maximum stress per square inch which can safely be allowed to come on the material of which the truss is composed, and several points require consideration before an answer to this can be given. If a bar of iron or steel be placed in a testing machine and subjected to a gradually increasing tensile strain, it may be noted that up to a given point, although a slight stretching of the material has taken place, the bar will immediately return to its original condition if the strain be removed; should a particular limit, however, be exceeded, this bar does not altogether recover itself, but receives what is called a permanent set. This takes place when the elastic limit of the material has been exceeded; and for present consideration it may be assumed that this elastic limit varies roughly from about one-half to three-quarters of the breaking strength of the material.

Then, in the same class of material, and often even in the same bar, a considerable variation in both the elastic and breaking strength may be met with. Small defects are also likely to arise in the workmanship which may escape notice; for example, when any considerable amount of welding is made use of, extra precautions are necessary both by way of employing only highly skilled smiths, and more than ordinarily careful inspection, to reduce to a minimum the risk of unsound welds being passed: in many cases it is impossible to detect a bad weld, which may only show its true nature when it gives way; and that being so, no emphasis need be laid on the desirability of keeping as far as possible clear from such doubtful, and possibly dangerous pieces of work. And lastly, there is always the possibility of the structure being subjected to some special condition which was not counted on, and possibly strained a little higher than the calculation indicated.

To allow for all these contingencies, a certain number called the "Factor of Safety" is chosen; the assumed breaking strength of the iron or steel being divided by this number to get at the maximum safe stress allowable. The factor of safety may thus be defined as the number of times the breaking strength exceeds the calculated maximum stress to which the several members may be strained—if the breaking strength be 20 tons per square inch, and the factor of safety be taken as 4, the maximum safe stress will be 5 tons per square inch. Some of the factors of safety used in practice may at first sight appear to be very high, but if it be remembered that on no account must the maximum stress approach the elastic limit (which value may but little exceed one-half of the breaking weight), and that a further allowance to meet the above-noted doubtful points requires to be made, this apparently high value will not long appear to be so. Taking the case assumed above; if instead of noting the breaking weight as 20 tons, the elastic limit of 10 to 12 tons per square inch be substituted, and this value be further reduced as just noted; the previously determined safe stress load of 5 tons per square inch does not by any means leave too wide a margin.

THE annual report of the medical officer of health for Shepley states that the sanitary condition of the district has improved since last he reported upon it. During the year twenty-seven nuisances have been abated, 300 yards of new earthenware pipes have been laid, nine sinks have been disconnected, and ten tapped. During the year the water mains have been extended to the Knowle. As regards an isolation hospital, the Council are willing to join with neighbouring authorities in providing one, when satisfactory arrangements can be made.

## SANITARY SCIENCE.

BY PAUL OGDEN.

### VENTILATION.

IN 1878 the Sanitary Institute of Great Britain offered the medal of the Institute for the best acting ventilator sent in to be tested. Several firms sent in cowls or air-pump ventilators, and the Committee, after testing against plain pipes, reported that it was unable to recommend the granting of the medal to any of those submitted, as the experiments appeared to show that the only use of the cowls tested was to keep out the rain. After such an expression of opinion by such high authorities, are we to disbelieve in all cowls sent round to our offices with wonderful results of recent tests set forth? What are we to do? The specialists ask us to leave it to them, with the assurance that they will guarantee to make everything satisfactory. I do not know of a question in any of the examination papers requiring a candidate to show the means by which he would ventilate certain buildings, but many questions are asked with reference to mechanical and natural ventilation, and on the general heads of the subject. Each person requires at least from 3 to 4 cubic feet of air per minute. Ordinary windows allow about 8 cubic feet of air to pass per minute. Sleeping rooms require 1000 cubic feet of space to each person. Fans are used both for extraction and supply. In Gwilt's chapter on this subject you will find what, to my mind, is the shortest and the best description of matters relating to this subject. He tells us that mechanical means are sometimes necessary to expel or withdraw the air—means such as farmers' bellows, pumps, &c.—but for general purposes it is more convenient, as well as economical, to trust to the natural method of getting rid of the vitiated air; that is by making certain ventilation tubes or openings at the highest points of the rooms towards which the hot air tends to flow, but he says nothing about "back draught!" Ventilation is, as a rule, divided into systems or branches called Plenum and Vacuum. By the first fresh air is

#### FORCED INTO THE INTERIOR

of a building, and the vitiated air is allowed to escape by openings contrived for the purpose. By the second vitiated air is drawn out of the building and fresh air finds an entrance through channels adapted for the purpose. Where several vent tubes are employed they must all be of the same vertical height, or the highest vent will destroy the efficient action of the lower ones, so that there might be a smaller discharge through two tubes than through one only. It must also be remembered that all gases do not rise. Means of ventilation are numerous, and complicated houses are usually ventilated by the admission of fresh air through a tube fixed to the wall upon the inside; upon the outer, lower end is fixed a grid directly communicating with the outer air, and upon the inner end (the top) is fixed a valve with a handle to regulate the admission of the air, which can be cleansed and cooled by a water spray or heated by gas jet. The extraction usual upon the opposite wall to the inlet, is by means of a flue opening at its lower end being carried up to the highest point of the roof or chimney stack. Back flaps are placed over the lower opening about the wall line to prevent the possibility of a back draught. In order to leave the fresh air tube and extract flue undisturbed in their action, the fire is sometimes supplied with fresh air by a separate flue of its own communicating with the outer air. Public buildings are usually supplied with a special apparatus driven by a gas engine. As a rule large chambers are provided in the basement into which, after passing through corridors for filtration, the air is admitted and there mixed to the required temperature, and sent up and by channels through grids in the floor or walls, into the large hall or room. The extraction is by suction, vitiated air being as a rule drawn from the ceilings and from gas jets down flues into the basement, and expelled

as far away as possible from the fresh-air inlet. Water sprays are used for cooling and cleansing the air as it is admitted. Sometimes it passes through screens and over ice as well as through a spray. It is heated, as a rule, by passing over hot-water coils, and sometimes over hot-air stoves. Schools are generally ventilated by extractors fixed upon the ridges high up

#### TO ENSURE A CURRENT OF AIR

all round, connected to the room at the ceiling by a tube of sufficient diameter or capacity to change air as often as required, dependent upon such conditions as number of persons, cubic contents, etc. The extractor is assisted by means of a sunlight which has a perforated corona surrounding an invented enamelled cover—in fact a combustion tube over the gas jets which when heated assist the current up the larger or outer tube, in the centre of which it is fixed. The fresh air is admitted at the windows, or tubes known as Tobin's patent are arranged round the room communicating with the outer air, having grids and regulating valves. Bad as many of the ventilating systems are, they are better than having no ventilating system at all. The plans and sections upon pamphlets showing channels, tubes, and arrows indicating the graceful flow of fresh and vitiated air must not be taken as a true indication of what can be done by the system set forth. In many cases they belong entirely to theory, and probably the opening of a door would alter or reverse the currents. The difference of temperature of the ever-changing atmosphere will ever be a barrier to the production of a perfect system of ventilation. The Institute gives no separate authority upon ventilation, but information may be gained from Gwilt and from the different specialists who have made a study of the matter. But the best information will be found in papers read before the Institute on the special ventilation of certain buildings requiring peculiar treatment.

COL. A. G. DURNFORD, R.E., an inspector of the Local Government Board, held an inquiry at the Public Hall, Frinton, a few days ago, in reference to an application by the Rural District Council for power to borrow a loan of £4500, to construct a system of sewerage for Frinton.

THE City Sewers Commission has resolved, after the close of the current year, to undertake the cleansing of the sewers instead of getting it done by contract. Under the existing arrangement the annual cost is about £3880. The estimate of the engineer is that it can be done for £2800, which will be an economy of over £1000 per annum.

AT a meeting of the Richmond Main Sewerage Board last week, Mr. J. E. Kelsall brought under the notice of the members experiments that had been made in the disposal of sewage by bacteria at Sutton, by Mr. Dibden, the London County Council analyst. So successful had been the experiments made that the district council had decided to dispose of the whole of the sewerage in the same way, and convert the sewerage farm, which comprised twenty-seven acres, into a recreation ground, and the buildings into reading-rooms.

AT Kidwelly the council recently advertised for a competent road surveyor, sanitary inspector, lamplighter, water inspector, building inspector, quay caretaker, and collector at the salary of one guinea per week, and, although the news of the unique position flew far and wide, only one man applied, and he from Neath. Discouraged at this lack of enthusiasm, the corporation re-elected their own official to be road surveyor and building inspector, and now the other offices are open to anybody who is content to look after the sanitation and the lighting and the water and the quay and the collecting in a town of 3000 inhabitants for fifteen shillings a week, free of income-tax.

## CHELSEA'S NEW PROMENADE.

AMONG other things, the London County Council Improvements Bill contains a proposal for dealing with the river at Chelsea, which has aroused the keenest hostility among all faithful Chelseaites, who, in spite of Thames Conservators and County Council, regard one reach of the river as their peculiar possession. This is the proposal which, as the Chelseaites contend, will improve away that beautiful stretch of unembanked Thames which extends from Battersea Bridge to the West London Junction Railway, close to the site of the old Cremorne Gardens. The river describes a wide curve to the north, and at high tide there is no broader expanse of water from Kew to Greenwich. To the right is Lindsey House, and below it, following the curve of the river, the oldest part of Cheyne Walk—

HOUSES FROM TWO TO THREE HUNDRED YEARS old, with long windows and high-pitched red roofs, standing secure within their patch of garden. A little farther is Turner's house, now a little forlorn and dilapidated, then a medley of new and old, ending characteristically in a public-house, which stands on the site of the gates which led into Cremorne Gardens. It is across this curve that the County Council proposes to draw a remorseless chord by prolonging the existing Chelsea Embankment in a straight line from Battersea Bridge to the other end of the bay. The river would then be straightened, the old shore would go, and we should have in its place a modern promenade with any other addition or adornment that the County Council might decide to place there. The Chelsea Embankment is beyond doubt a fine modern improvement of which any city might be proud; but is it necessary, ask the objectors, that in continuing it this unique curve of the river should be ruined? The roadway is no doubt narrow and unsatisfactory, but the roadway can be widened without in any way interfering with the trend of the river. As far as the low-tide mud is concerned, the alleged smell comes not from that but from the north low-level sewer which runs under Cheyne Walk, and which is now taxed beyond its proper capacity by the increase of certain great West London districts. So the Chelsea petitioners against the County Council scheme propose

## AN ALTERNATIVE PLAN

of their own which, as they claim, preserves the view, widens the road, and saves some £50,000. But this is not all. The County Council scheme obviously reclaims a large tract of river, and throws the houses of Cheyne Walk a considerable space back from the shore. What is to be done with this reclaimed land? The inhabitants of Chelsea, and particularly of that end of Cheyne Walk, note with dismay that the Council takes power to lease, sell, and otherwise dispose of any lands acquired by them under the provisions of the Bill for building or such other purposes as the Council think fit. Instead, therefore, of an embankment garden or new open space to compensate for that taken from the river, the Council may erect, or permit to be erected,

## NEW BLOCKS OF FLATS,

houses, or warehouses between Cheyne Walk and the river. The suspicion that the Council will recoup themselves for their outlay by letting this large and valuable site for building purposes is certainly not to be dismissed as groundless. The river is, at all events, an open space, whatever else it may be, and a public authority, even if it deems it necessary to encroach upon the river, should be prepared to give a pledge that the land reclaimed should also be preserved as an open space. It is to be hoped that the Parliamentary Committee to which this Bill will now go will consider very carefully whether it is necessary to destroy this beautiful reach of old river, and whether the alternative scheme of the objectors does not meet all the necessities of the case from the point of view of public convenience while preserving one of the few remaining stretches of the Thames, as our grandfathers knew it.

## Surveying and Sanitary Notes.

THE annual dinner of the Sanitary Inspectors' Association was held at the Holborn Restaurant the other day. Sir John Hutton (the president) occupied the chair. The chairman, in proposing the toast of the evening—"Success to the Sanitary Inspectors' Association"—said the history of the association amply justified its existence. Founded in 1883, and incorporated in 1891, its membership in 1895 stood at 349, and now it was within a few of 700. The past year had been a record one for the establishment of branches. There were throughout England and Wales 1844 authorities who called to their aid the skill of sanitary inspectors, who numbered, roughly, about 2000, and who, by contributing to the nation's health, contributed also to the nation's wealth. He had often thought that in some districts of London a cleansing order rather than a closing order was wanted. Among the questions engaging the attention of the association at the present time were those of superannuation, fixity of tenure, and the examination by a competent authority, on which the association should have representatives, of new sanitary inspectors. Sir Arthur Arnold, replying to the toast of "Local Government," proposed by Dr. J. M. Rhodes, recalled the time when houses in London, rated at upwards of £60 a year, were built over cesspools, and when people of the middle class lived in sanitary misery exceeding that of the savage races of Africa.

THE Local Government Board has refused to sanction, on sanitary grounds, the proposal of the Abney Park Cemetery Company to lay out a new cemetery at Golder's Hill, adjoining Hampstead Heath.

THE City stoneyard, in Paul Street, Finsbury, is about to be abolished. Time was when the yard was of some importance for the storage of paving material, but since the advent of asphalt and wood for paving purposes its value has gradually declined, and the number of men employed in the yard has naturally decreased. In future the stone-paving work will be provided for in the contracts for general paving operations, and a considerable saving will be effected.

MR. H. McLACHLAN, the district surveyor of the western division of the City, has issued a circular to the members of the Commission of Sewers, protesting against the action of that body at its last meeting, when it was resolved to appoint another surveyor in his place. He asks the members to give him a hearing, and to make a full investigation into the action of the Streets Committee.

MR. LOUIS IVES, of Brighton, has been recommended for appointment as Assistant City Surveyor for Wakefield. Mr. Ives was formerly employed by Mr. H. Crutchley, C.E., of Wakefield, with whom he served his articles. He is the son of the late Mr. Nathan Ives, engineer at the Wakefield Prison.

By the Talla Water Scheme Act of 1895, the Edinburgh and District Water Trustees were empowered to construct a service railway between Broughton Station, on the Peebles Branch of the Caledonian Railway, and the projected reservoir in the Talla Valley. The reason for the Trustees proceeding with such a work was, of course, to save the cartage of material. It is estimated that something like 100,000 tons of clay will be required for the puddle trench at the reservoir, and to have driven that by horses for the eight and a half miles between Broughton and the reservoir would have in itself entailed the expenditure of a very large sum of money. The Trust had also to think of the cartage of the pipes, cement, and other material to the upper

reaches of the Tweed Valley; and, in all the circumstances, it was considered that it would be more satisfactory, when so large an undertaking was in hand, to have a railway for the conveyance to it of the necessary building material. The contract was entrusted to Messrs. James Young and Sons. The work has now been practically finished.

THE Works Committee has recommended the Aberdeen Harbour Board that the graving dock should be reconstructed on its present site, in terms of the report of Mr. Nicol, the harbour engineer, who proposed that the dock be increased in length 100ft., and the entrance made 9ft. wider, with 3ft. additional depth of water on the sill, necessitating a new and larger caisson for closing the entrance. The width of the dock between the lowest altars would be increased 11ft., while the working width of floor space would be 18½ft. wider. Provision would be made for dividing the dock into two portions by a central caisson for the accommodation of vessels undergoing extensive and prolonged repairs, and the pump-house, which is inconveniently situated, removed to the other side of the dock. The engineer also proposed that the work should be executed in granite masonry and brickwork, Portland cement concrete being only used in situations where it would not enter into the structural features of the work, and where it would be entirely protected from sea water. The expense of reconstructing the dock was estimated by the engineer as follows:—Entrance works (including caisson chamber), £18,200; main body of dock, £59,300; central caisson berths, £4700; new pump-house, £2620; inclosing wall and office, £780; cofferdam and dolphins, £3750; new iron caisson and folding bridge, £4850; new pumping machinery and sluices, £1850; altering and repairing existing caisson, £650; rebuilding portions of quay and return walls, £7200; strengthening remainder of quay walls, £8470; shifting timber wharf at west end, £600; contingencies (at 5 per cent.), £5630—total cost, £118,600. The Board has decided, however, to ask the opinion of a competent engineer on the whole report, and especially as to whether the present graving dock could be temporarily repaired at not too great a cost, to stand for a few years; whether the present site was the most suitable available; and whether the plans and specifications of the engineer were suitable and best for the site.

MR. WILLIAM SPINKS, lecturer on Sanitary Engineering, Yorkshire College (Victoria University), has been elected President of the Institute of Sanitary Engineers (Incorporated) for the ensuing year. The membership of the Institute now numbers over 460.

At the request of the Glasgow Corporation Statute Labour Committee, a report has been prepared by Mr. Whyte, the Master of Works, regarding the erection of barricades in front of buildings in course of construction or repair. The report stated that under the Glasgow Police Act, 1862, a portion of a road or a street, not exceeding one-fourth, might be enclosed by a hoarding. Dealing with a suggestion that overhead platforms should be substituted, Mr. Whyte said so long as the system of raising building material from the streets by means of cranes is continued, it would not be advisable to do away with a hoarding on the street, but this system ought to be done away with to a large extent. He suggested that, as a general rule, all materials should be raised in the interior of the building, and that the crane be so placed that in the event of any portion of it giving way the jib would not fall on the street. In the event of very heavy material being required to be lifted from a lorry, the work should be done at such time as the street is free of passengers. Mr. Whyte further stated that the time had come to abolish the practice of dressing material in sheds erected on streets. All material should be dressed before being brought to the building. Edinburgh, he pointed out, has to some extent adopted the method he proposes, and what can be done in Edinburgh can be done in Glasgow.

### The Architect as Organiser.

WE have witnessed in commercial affairs the growth and perfection of a system of organisation of skill and labour which permits one man, possibly ignorant of the technical details of his business, to secure to himself the maximum of profit on any particular work with the minimum of trouble. It may well be that the complex state of our civilization has made the old system impossible, and that this present one is but a phase in our industrial development to higher and better things. We notice it more particularly in the business of the general contractor, with which we are necessarily brought into close contact. We see him becoming little more than a financier and agent for the sale of other peoples' manufactures, with no personal interest in, or knowledge of, the details of any particular building in his charge. That this results in cheap buildings seems to be the general opinion, but we think they have a tendency to be both cheap and nasty. We are not now principally concerned with this system in the building trade. We think it has probably reached its zenith, and that in these days, when a desire is growing for a more direct and personal contact between Artist and Craftsman, the general contractor may shortly discover that his occupation is gone. We would, however, rather draw attention to the growth of this system in the Architectural profession, which we believe is fraught with grave evil to the future of Art. It is the custom for many successful practitioners to rely on their assistants for the designing and the real Architectural work, which, though they could not do it themselves, they can yet organise and control in a general sort of way. Such men have no claim to the title of Architect, and it is only allowed them in the Profession as a matter of form. There is, however, another type of man who would wish and who does, endeavour, to give every detail of his work a personal supervision. This man finds that the difficulty of making a living, combined, perhaps, with his own lack of facility, prevents him from spending time in designing personally every detail. So he drifts into the habit of employing special firms for various parts of the work, such as chimney-pieces, wrought-iron work, plaster decoration, mosaic pavements, &c. These firms submit designs of their own, which the Architect is pleased to approve or otherwise, and then they go in as part of his design. In all this the Architect is simply organising the skill and labour of others, and his only value seems to consist in a certain judgment and good taste in the selection. There are, however, many laymen, and lay women, who might do it just as well. There is some reason in the argument that a specialist in any of these branches of handicraft is more likely to be able to produce a practical and characteristic design; but if this is so, it applies, perhaps, with greater force to masonry and joinery. Many Architects, who would never dream of permitting the mason to make his own details, have no hesitation in allowing the iron-worker to do so. Why is this? The one is as integral a part of the design as the other. In all probability the root of this evil, as of nearly all others that afflict the body Architectural,

lies in the absence of a general and living style of Architecture. If such a style existed, it would be natural to let every Craftsman develop his own ideas, within certain limits, as we see in the Mediaeval work; they would always be in harmony with, and subservient to, the main idea. In its absence, as at present, it is most difficult for the Artist to get the Craftsman to understand just what sort of thing he wants, and equally difficult for the Craftsman to turn out characteristic work in the particular style required, as the unfortunate man is expected to work with equal facility in as many styles as he has customers. If the Artist wishes to obtain harmony and style in his building, he must give his personal attention to every detail, and infuse into it his own personality.

decline as the tenants of the first three years leave, driven out by draughts, by ceilings falling, by defective drainage, and such evils as many of us are far too familiar with. The unhappy owners, who have bought these houses from the speculating builder, cannot afford to let them stand empty, and they have to lower the rent (most of which goes in repairs), and accept an inferior class of tenant. The short-sightedness of freeholders, who part with their land and permit it to be dealt with on these lines, is surprising; the more so when it is remembered that most of the available land around Greater London is held by business men awaiting the time when the growth extends outwards to their lands. It is, therefore, all the more welcome to find that this rule occasionally has an exception, and that in the picturesque and

YORK STREET RESIDENTIAL CHAMBERS—FRONT ELEVATION. MESSRS. BALFOUR AND TURNER, ARCHITECTS.

### A Model Estate.

YEAR by year larger circumference embraces London. There are no visible signs of the least decrease of building, and, in fact, all branches of the building trade are so fully occupied that there is a difficulty in getting builders to tender for contracts, their yards being already full of orders. What this means in adding to the increase in the size of London during the present year is obvious. With the improvement in trade the metropolis will increase in size even in a larger ratio than during past years. As a rule the building which is executed in suburban London is of the very worst character, run up by speculators for a rapid return and large profits, to fall into speedy decay and ruin. The smart neighbourhoods

healthy suburb of Finchley a very large estate, known as Grass Farm, is being developed upon very different lines. The distance of Finchley from the City is a matter of only twenty-three minutes from Broad Street, from which station and Moorgate Street a good service of trains exists; and even this will be improved when the new line to Finsbury Park from the City is complete. The owner of this estate, Mr. J. C. Williamson, did well to follow the advice of his Architect. The estate lies in a wooded part of the country between Hendon, Church End, Finchley, and Mill Hill, close to the stations of the two latter parishes. Wide avenues, sixty feet broad, unite these places, crossing the estate in lines of gentle curves through the fine wooded land, straight lines being no part of the designer's scheme. The

north of London is well known for its damp clay soil, but here at the Grass Farm, immediately below the top soil, gravel and sand are to be found to a depth of 30ft. to 40ft. No jerry building is to be allowed, and the houses already going up are of large size, varying from £2000 to £4000 in value. Every house is to be wired for the electric light, which will be shortly installed upon the estate, and supplied to the tenants at a reasonable rate. Another unusual thing in estate development is taking place here. The roads are being made right up to the utmost demands of the local authority, so that the dreadful evil of struggling through mud and puddles in darkness to find your friend's new suburban home will not exist in this neighbourhood. In fact the Architects have done everything to avoid newness, and thereby the freeholder will benefit. Every inducement, even apart from good building, is made to the future residents on Grass Farm. A large club house, with assembly rooms and stage for theatricals, has already been designed, and is expected to be ready for use next Christmas.

### LEANING TOWERS AND CHIMNEYS.

UNDOUBTEDLY the leaning tower of Pisa, in Italy, is the most noted leaning tower in the world, but there are in this country two, if not more, towers which quite equal to, if they do not surpass, in crookedness that famous edifice. The tower of Pisa is a round one, built in circular stages, one above the other, the circumference of each gradually diminishing as the structure ascends. The precise height of the tower is 180ft., and the amount of "lean" it has from the perpendicular is 15ft. However, the "Falling Tower" of Caerphilly Castle, in Wales, is but 77ft. in height, or less than half that of the Italian tower, yet its variation from the perpendicular is no less than 11ft. And of the crowds of people who flock every year to Italy, and go to see the tower at Pisa, how few know that there is in their own country, almost close to them, so to speak, a much greater marvel? Doubtless, the greatest wonder in this or any other country in the shape of leaning towers is the "Crooked Spire of Chesterfield." This is a most striking sight to everyone who sees it for the first time, and one cannot get rid of the idea that it is about to fall. A splendid view of it is obtained from the train as one enters Chesterfield from the north or south. The whole spire of the Church, though a most graceful object in itself, seems to be

#### WARPED AND TWISTED

in every direction from top to bottom. We are told that the spire was not built so in the first instance. But there seems to be no definite information available as to when it became twisted. Hence those best qualified to form a judgment on the matter have decided that the warping or twisting has been gradual. The causes of it also are not at all well understood. Some of the best authorities fancy it is due to the wood which forms the foundation work of the spire having from some cause or other, which they do not profess to explain, become badly warped or twisted. Other people ridicule the idea, and contend that the crookedness is due to the spire having at some time or other been struck by lightning. But if this were so, surely there would be some record of it, however meagre, amongst the town's archives! Yet others contend that the crookedness is only an optical illusion. Whilst these are our noted "falling towers," there are up and down the country many specimens of leaning high chimneys belonging to various works and foundries. The most famous of these, as being probably the most out of the vertical, is that known as Brook Mill, in Lancashire. The chimney itself is about sixty yards in height, and its measured deviation from the perpendicular is some 6ft. 6in. There was some fear expressed a little while ago as to its being quite safe, but, though its look is certainly threatening, it was considered by experts to be perfectly secure, and as it is encircled with iron belts of

Scale: 1" = 10' 0"

YORK STREET RESIDENTIAL CHAMBERS. GROUND PLAN. MESSRS. BALFOUR AND TURNER, ARCHITECTS.

very great strength, its power to resist a gale has been enormously increased. Mr. W. E. Harrison, the steeplejack, of Sheffield, states that there are many chimneys in South Wales and Lancashire which are more or less out of the perpendicular, owing, he thinks, to the number of coal-pits in their vicinity having caused subsidence of the earth, and

#### AFFECTED THEIR FOUNDATIONS.

The same authority also states that there is more than one Church spire in this country which is not quite vertical, though the people in its neighbourhood may not know it, but for obvious reasons it is best not to mention their names. America has its leaning tower. It exists in the city of Syracuse, in the State of New York, and is just now the cause of a fierce strife, because the people declare that it is an imminent source of danger, and liable to fall at any moment. It has, however, like every other leaning tower, been declared to be thoroughly safe. The tower has only become one of the leaning variety at a comparatively recent date. The circumstances that brought it into prominence in this role was a hurricane, or as some call it, a tornado. In any event it was a tremendous wind, the fiercest and the fastest which even the oldest inhabitant of Syracuse ever heard of. Buildings in their entirety were lifted up and smashed into kindling wood, but though the big tower swayed from side to side it did not fall. On the top of this tall tower was, and still is, a water-tank, and this, wonderful to relate, at the time of the storm contained its normal contents—10,000 gallons of water. When the storm was over hardly a gallon had been lost. The tower, however, showed the effect of the terrific blow. Before the storm happened the structure had been as straight as a British grenadier, but after, it was found to have been twisted upon its axis, and bent over so that it leaned in as great a degree as the tower of Pisa.

### SETTING OUT PROBLEMS.

#### No. III.

WE have pleasure in announcing another of the series of Problems it is our intention to give from time to time, as stated in our issue of May 20th last.

#### PROBLEM.

It is required to take a cross-section of the bed of a river, shewing the depth at every 10ft. along a given straight line lying nearly at right angles to the stream. The banks slope gently to the water, which is known to be about 100ft. in breadth, and not more than about 8ft. or 9ft. in maximum depth. Circumstances preclude the erection of temporary staging. A small boat is available for use; but owing to the current it is found impossible to row her along the line of section to take soundings with the requisite accuracy.

To the authors of the first ten correct solutions of this Problem received at the Office, Volume IV. of THE BUILDERS' JOURNAL, bound and gilt-lettered, will be awarded.

Solutions should be addressed to the Editor, and marked "Problem" on the envelope.

THE Secretary of State for Foreign Affairs has received a despatch from H.M. Minister at Brussels stating that tenders are invited for the construction of the new Harbour works at Ostend. Tenders will be opened on April 17th at Bruges at the offices of the Provincial Government, and the plans and estimates of the works may be consulted at the "Musée Commercial" at Brussels. Such further particulars as have been received may be seen at the Commercial Department of the Foreign Office any day between the hours of 11 a.m. and 6 p.m.

## Men Who Build.

No. 49.

MR. EUSTACE BALFOUR.

**M**R. EUSTACE BALFOUR, who is brother of his distinguished namesake, the present Leader of the House of Commons, and a gentleman of private fortune, was educated at Harrow and Cambridge, where he matriculated at Trinity College, and in due course took his B.A. degree, and ultimately the degree of M.A. Unlike other members of his family, Mr. Balfour had other ambitions than those of a public man, and even during his Cambridge term gave up a considerable part of his time to the study of Art, and had made Architecture his mistress before his degree was conferred. Upon leaving the University he became a pupil in the office of Mr. Basil Champneys, or rather a "student," for the ordinary forms of pupilage were waived, and, after a much shorter term of practical experience than is usually advised to a young Architect, he began to practice on his own account, and set fairly forth on his career as an Architect.

It will be noticed that the designs which are reproduced in these pages are without exception the joint work of Mr. Balfour and his partner. Mr. Balfour's alliance with Mr. Thackeray Turner, whose name is known in Archaeological circles as well as among Architects, began many years ago, and Mr. Balfour attributes all his best work to this period, and does not wish that his work should be dissociated from that of a partner in collaboration with whom his most important and most successful buildings have been designed and executed. As Mr. Balfour is agent to the Grosvenor estate, and Surveyor to the Duke of Westminster's immense building property, it may well be imagined that his association with Mr. Turner is a reality, and not in any way one of those arrangements for mutual convenience which are so common in the Profession, and which are no right partnerships at all.

Before considering in detail any of Messrs. Balfour and Turner's designs, it is of interest to know that whatever effects their work may achieve, these effects owe nothing to the facile pencil of the sketcher, nor to those perspective drawings that are so commonly used to point

errors in proportion or arrangement, and to bolster up the designers, faltering confidence and wavering decision. Never a perspective will Mr. Balfour suffer to be drawn of his designs, and he relies on photographs alone to record for him the detail and arrangement of the buildings he puts up. More than this, he

FROM A PHOTOGRAPH BY F. HOLLYER.

holds that the whole system of making "pretty" drawings is false and misleading, and makes for bad design. It is easy for any clever sketcher—or indeed for anyone who can handle a pen or pencil with a little taste—to make the worst elevation look a passable design, and the knack of clever drawing becomes not a means of illustrating and

judging the effect of a proposed building, but a means of glossing over and forgetting primal defects in the designs. Indeed, Mr. Balfour believes, although he has made sketches himself in his younger days, that unless the Architect can deny himself, when he comes to design, the pleasure of playing about over his elevation with a deft pencil till his eye is pleased and satisfied (as is most commonly now the process of design), and can build in his mind, putting down on paper just such lines as are needed to show the position and proportion of the parts, it were better in the interests of Architecture he had never sketched at all. "Anyone," says Mr. Balfour, "can draw enough for the purposes of designing and raising buildings; drawing has nothing to do with it." He admits at the same time the temptation to make a drawing look "nice," and perhaps it is this fellow human weakness that has brought him to the strangely literal and exact interpretation of his theories, which he follows in practice. "I have not got any drawings: we don't make any in this office," says he, and indeed it is the case. The sheets, when not left in pencil are lined in thinned ink, nothing is shown but what will suffice the foreman for his directing; the elevations are not as a rule coloured or printed, the windows being left unwashed in, and the whole figured over with dimensions, and covered with notes and directions to the trades. As Mr. Balfour says, they are not drawings; they are merely workmen's instructions, set down in as primitive a manner as is consistent with accuracy and clearness. Indeed, the ascetic self-denial of Messrs. Balfour and Turner would hold their office, regarded by the sparks of the Institute with their certificates and awards of merit, much as the gay cavalier regarded the anchorite's cell with its hair-shirt and its beans twice a day.

But if our Architects have devised a process of getting their results which is opposed to the motives and the procedure of the Profession in general, those results must certainly raise their process above all imputation of fad or whim, and show it to be based on some sound and far-reaching truth. Of the truth of the designs illustrated in these pages, there is not space to speak particularly, although we may say that the block of Ladies' Residential Chambers is chiefly of interest for its plans, in showing how the requirements for blocks of small flats with a common kitchen and dining room may be met, and for the

AMPTON HALL, BURY ST. EDMUNDS. MESSRS BALFOUR AND TURNER, ARCHITECTS.

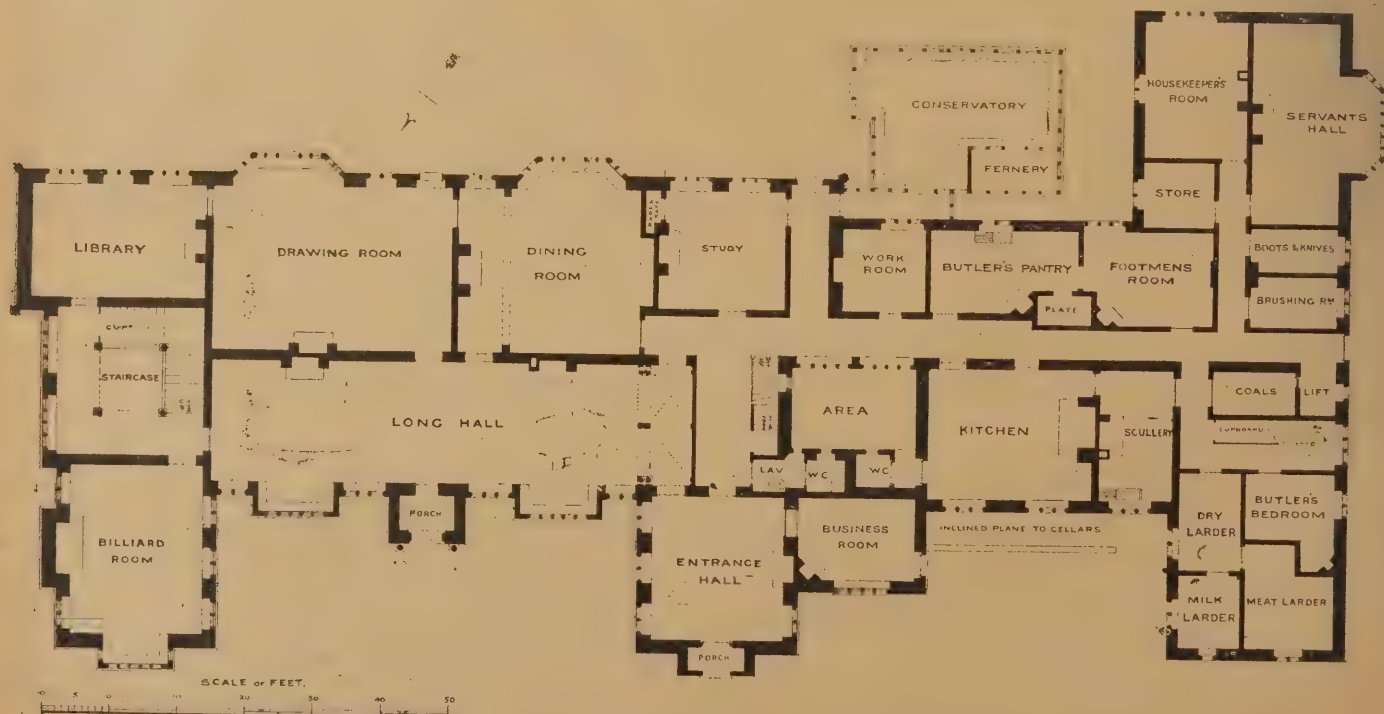

DINING-ROOM, AMPTON HALL.

curious continuous newel post of the staircase, an outcome of our modern needs and fashion of living; and that Ampton Hall was built on the foundations of an old Jacobean house that was completely destroyed by fire. The present house does not reproduce that which it succeeds, although, as will be noticed, the detail owes to the traditions of the Jacobean period. Mr. Beit's house, however, and in especial, the Parish Church of St. Anselm, call for particular attention. The peculiar form of Mr. Beit's house, the distinctive Architecture of which must have attracted the notice of all who have been in that part of Park Lane during the last few months, is due to rather peculiar circumstances. The site now occupied by the house and garden was originally offered for sale in two lots. The northern or uppermost of these was bought by Mr. Beit, and Messrs. Balfour and Turner prepared designs for a house which was actually raised several feet before the owner decided to purchase the adjoining plot, and complete his site as it now may be seen. It is for this reason that the

Architects have been unable to avail themselves of the best aspects afforded by the site in making their plans, for the south wall of the original design overlooked, at a range of but 27ft. any house that ultimately might have been built on the lower half of the site, and though this was fortunate in that it enabled the billiard room and winter garden now seen to be added without inconvenience to the plan, still the indecision of the owner has prevented the building from availing fully of the aspects afforded by the site. It must have puzzled some people unaware of these circumstances, to see the house, as it were, reversed, and turning its back on our scant London sunlight. It may be added that certain requirements of the Grosvenor Estate limited the height of the annexment, and these circumstances should be remembered by those who may see any lack of unity in the parts. Want of homogeneity does, perhaps, mar the design, though certainly in no aggressive features. It may be regretted, in one particular, that the simplicity of the second floor should carry a suggestion

of the Archaic upon it, and jar with the classic origin of the lower portion of the building. One feels almost a personal obligation to the Architects, however, in that they have refrained from polishing the columns about the entrance and forming the pseudo-colonade about the Winter Garden. These are of black Allox granite; but so far from really being black, the grace of the stone lies in its grey-green mottling. It is a very beautiful stone, and the Architects have used it with great success in the front of St. Anselm's Church, which, by the way, is in Davies Street, just off Oxford Street, and only a short walk from Park Lane. Of the interior of this Church we are able, by the special permission of Mr. Balfour, to publish an excellent photograph, but, good though it is, it is hardly necessary to remind our readers that the actual effect of a Church can not be justly presented in a photograph, however interesting and valuable it may be as a memento or a record. St. Anselm's is centrally placed, and the north entrance is kept open morning and afternoon.

Of this Church we may say at once that we consider it not only one of the most interesting of modern Churches, but the best Church raised in London of late years. It is of interest to compare this Parish Church of St. Anselm with Mr. Aston Webb's French Protestant Church in Soho Square, and with the Church of Holy Trinity, built by the late John Sedding, at Sloane Square; both of which have been raised within the last ten years. In all of these we find a right-spirited attempt to build a nineteenth century Church: a Church, that is, which shall be convenient to the needs of our day, shall conform to the sentiments of our day, and shall further express, eulogise, and decorate the needs and sentiments of our day; all just in the same way as a Church should conform to the limitations of the site on which it is raised, and the circumstances under which it came to be built. It is specious and false to complain of our present existence as being prosaic and unbeautiful. The irredeemable qualities of electric light and steam power we hear so much about, confesses only the irredeemable dinginess of the minds of those who see only those prosaic, unbeautiful qualities. It is the duty and the privilege of the Poet and the Artist to accentuate the romantic attributes of these "prosaic" characteristics of our life, and decorate the prosaic necessities of our existence. It is this spirit, and this alone, that has produced all the great Arts and Architectures the world has seen. When, therefore, we see

GROUND PLAN OF AMPTON HALL, NEAR BURY ST. EDMUNDS.

in these Churches of Mr. Webb and Messrs. Balfour and Turner, hot-water radiator recesses carefully designed to play their part in the breaking of the wall surfaces, and to emphasize the proportions of the Church; and attention given to acoustics, ventilation, and light, we may hope that there yet will come a day when twentieth century Art will take no insignificant place in the annals and traditions of Architecture. Possibly in those days a retrogression of Art may come to pass, and the twenty-first century equivalent to the Arts and Crafts Society will work on the same lines as with us now, and applaud a wooden bedstead fashioned in reproduction of a nineteenth century cast-iron hot water radiator. Who can tell?

Messrs. Balfour and Turner's Church is best

Archaic without forcing a comparison with our present fashions; and it certainly shows how much more some such style as this is amenable to the needs of modern Church-goers, than the incompatible mysticism of the Gothic styles.

There is none of the effort in straining traditional Gothic forms to new needs, which mars and destroys the homogeneity of John Seddings' Church. St. Anselm's has a rare homogeneity, and, though not a rich nor a very expensive Church, it is still complete and equipped, without those barren features we are wont to expect in modern Churches; or at least in Churches other than those raised by the Church of Rome. The character of the Church has been represented with great nicety down to the minutest details. It is with a fine

the photograph at the south-east corner of the Church. The panels are of open carved oak fret, representing the conventional vine, with grape clusters and birds, lilies, and the cresting is a continuous design of the same character. The choir is cut off from the body of the Church by a marble plinth, topped with a bronze or gun-metal railing, and there is besides the altar rail, with turned brass balusters before the sanctuary. There is no pulpit proper in the Church, but a reading-desk within the choir, at which the preacher stands. The general vista of the Church owes much to the south chapel, which has been formed by doubling the two westernmost bays of the south aisle. The eastern respond, and the adjoining column of this arcade, are to be seen to the right of the photograph. Everyone

ST. ANSELM'S, DAVIES ST., W. INTERIOR. MESSRS. BALFOUR AND TURNER, ARCHITECTS.

described by the term Romanesque; but the term cannot be judged literally. It is spacious, light, and airy, and has a breadth and magnificence not found in some much larger and more costly Churches. The material is a grey-green Yorkshire stone, and this has been treated to a solution of wax to bring out its colour and variations of tone. The panels are white plaster, and there is a low plinth of opalescent tiles, which have a texture transparency and variety as of marble. The double columns of the arcade are connected by elliptical arches; the transverse arch of the aisles spring from the wall, and the space between them is groined with a quadripartite vault. Semicircular arches cross the nave between the clearstory windows, the ceiling between them being panelled in dark wood. The whole Church is a very happy conception, it catches a distant atmosphere of the severity

sense of unity in the effect that the oak choir stalls have been left rough from the chisel, and the iron railings adjacent to the south porch, and the iron studding to the oak doors bear upon them, in the same way, the history of their fashioning by the blacksmith. The simple black Alloa granite font, which is a huge cubic block shaped in rattle curves, follows also this feeling. It is not a true octagon, as at first might seem, but rather eight-sided, four of the sides being shorter than the remainder, and the circle of the basin similarly has not been turned true, but has the pleasing form of a circle carefully cut by the eye, a circle, that is, whose characteristic feeling, if accentuated, would resolve it to a square. The pierced screen which cuts off the stairway to the vestry, and the private door to the parsonage, is also a happy departure from the stereotyped Gothic forms. It is shown in

who is at all interested in Churches, or in modern Architecture and its possibilities, should avail themselves of an early visit to St. Anselm's.

THE West Suburban Railway Bill, which proposed to incorporate a company for making a railway from Praed Street, Paddington, to Willesden, of the length of four miles and forty-one chains, and which was to be worked by electricity or cable power, has been withdrawn.

A REFERENCE to determine the price to be paid by the Corporation of Stirling for the Stirling Gas Company's works was opened last week at Edinburgh. The town offered £61,130 for the works, but the gas company demanded £68,320, and it was decided to refer the question of price to Sheriff Lees as sole arbitrator.

PLAN OF ST. ANSELM'S CHURCH, DAVIES STREET, W.

## EIGHTEENTH CENTURY WORK.\*

By J. A. GOTCH.

THE eighteenth century saw the final development of that great movement in Art which begun in the early years of the sixteenth. When mankind had once made up its mind that the masterpieces of Italy were the only examples to be followed, nothing but time and determination were wanted to produce in all the lands of Europe a general sameness of appearance and treatment in every branch of Art. In no Art was copyism so contagious as in Architecture, and in no Art was it so injurious. For Architecture is essentially a constructional Art, a fact which the eighteenth did not realise, and a fact which wants no little reiteration at the present time when there seems to be a tendency to neglect construction for the more attractive accessory Arts, and to desert the stately queen for her more lively handmaids. A constructional Art, to be healthy and natural, must develop from within, and not from without. Architecture in the eighteenth century was the Five Orders and nothing more. An old Roman, called Vitruvius, who had been dead seventeen hundred years, was Dictator, and those of his followers who differed from his precepts, although sometimes excused on account of their success, were admonished to be careful how they risked any deviation from the paths of perfection pointed out by him. Gothic Architecture was despised and regarded as barbarous. It was not that the votaries of the Art preferred a Classic dress to a Gothic: for them the buildings erected in the Middle Ages were not Architecture at all. The "Gothick Order," as they called it, is described by one of them as "the Folly and very Ape of Architecture." Such an attitude of mind is hardly intelligible to us who recognise Gothic Architecture as at once the most logical and

## DARING FORM OF CONSTRUCTION

that man has yet employed. It is hardly less difficult to understand how they can have failed to be impressed with the majestic solemnity of a great Gothic Cathedral; and yet they did fail—even such cultivated men as Evelyn and Addison. The phrase about the "very Ape of Architecture" occurs in a treatise by a lively Frenchman, M. Freart; and, considering the subject, a very entertaining treatise it is. But Evelyn's views were those of a sagacious,

unimpassioned Englishman, and are worth quoting at some length as illustrating the standpoint from which the early eighteenth century looked at the subject. In treating of Architecture, he says:—"It is the Antient Greek and Roman Architecture only which is here Intended, as mostly entirely answering all those Perfections requir'd in a Faultless and Accomplish'd Building; such as for so many Ages were so Renowned and Reputed, by the Universal Suffrages of the Civiliz'd World, and would doubtless have still subsisted had not the Goths, Vandals, and other Barbarous Nations Subverted and Demolish'd them. . . . Introducing in their stead, a certain Fantastical and Licentious manner of Building, which we have since call'd Modern (or Gothic rather) Congestions of Heavy, Dark, Melancholy, and Monkish Piles, without any just Proportion, Use or Beauty, compar'd with the truly Antient: So as when we meet with the greatest Industry, and expensive Carving, full of Fret and lamentable Imagery; sparing neither of Pains nor Cost; a Judicious Spectator is rather Distracted and quite Confounded, than touch'd with that Admiration, which results from the true and just Symmetric, regular Proportion, Union and Disposition; Great and Noble manner, which those August and Glorious Fabrics of the Antients still Produce. It was after the Irruption, and Swarms of those Truculent People from the North . . . when instead of those Beautiful Orders . . . they set up those Slender and Misquise Pillars, or rather bundles of Staves, and other incongruous Props, to support incumbent weights, and ponderous Arched Roofs, without Entablature, and tho' not without great Industry . . . nor altogether Naked of Gaudy Sculpture, trite and busy Carvings; 'tis such as rather Gluts the Eye, than Gratifies and Pleases it with any reasonable Satisfaction: For Proof of this (without Travelling far abroad) I dare report my self to any man of Judgment, and that has the least Taste of Order and Magnificence; If after he has look'd a while upon King Henry the VIIth's Chappel at Westminster; Gaz'd on its Sharp Angles, Jetties, Narrow Lights, lame Statues, Lace and other Cut-work and Crinkle Crinkle; and shall then turn his Eyes on the Banqueting-House built at White-Hall by Inigo Jones after the Antient manner; or on what his Majesties present Surveyor Sir Christopher Wren has lately advanc'd at St. Paul's . . . and compare them judiciously without Partiality and Prejudice; and then Pronounce, which of the two Manners strikes the Understanding as well as the Eye with the more

Majesty, and Solemn Greatness. . . . In this sort have they, and their Followers ever since fill'd, not all Europe alone, but Asia and Africa besides, with Mountains of Stone, vast and Gygantick Buildings indeed; but not Worthy the name of Architecture: Witness

. . . what are yet standing at Westminster, Canterbury, Salisbury, Peterborow, Ely, Wells, Beverley, Lincoln, Gloucester, York, Durham, and most Cathedrals and Minsters." Thus far Evelyn. That Addison had no clearer insight into the nature of Architecture will be seen from the 415th *Spectator*, where he says:—"Let any one reflect on the disposition of mind he finds in himself at his first entrance into the Pantheon at Rome, and how the imagination is filled with something great and amazing; and, at the same time, consider how little, in proportion, he is affected with the inside of a Gothic cathedral, though it be five times larger than the other; which can arise from nothing else but the greatness of the manner in the one and the meanness in the other." The fact is that Architecture to them was, as already said, the Five Orders and nothing more—to some of them less indeed, since they only admitted the claims of two out of the five grudgingly and of necessity. Architecture, in their opinion, dealt almost exclusively with the

## EXTERNAL APPEARANCE,

and they dismiss in few sentences such considerations as the disposition of rooms. Planning to them meant first and foremost the arrangement of their building in regard to its appearance, not in regard to the functions it had to fulfil. Broadly speaking, a well-designed building is as much a product of evolution as natural scenery or the forms of plants and animals. Natural scenery is almost entirely governed by the geological formation of the district. Plants and animals have assumed their various forms chiefly as the result of the necessities of their growth, which, again, are dictated by the functions they have to fulfil. And so it is—or ought to be—with a building. Architecture is not only the art of building finely, it is the art of building finely in order to comply with certain specific conditions. This notion of Architecture was unthought of by the eighteenth century, brilliant though it was; and so the chief aim of its Architects was to dazzle and impress the spectator, not to please and satisfy the in-dweller. Lord Chesterfield told General Wade, for whom the Earl of Burlington had designed an inconvenient though handsome house in Burlington Street, "if he could not live in it to his case, he had better take a house over against it and look at it;" a piece of advice by which many a nobleman might have profited. It has been observed that when people take to writing about Art they have ceased to practice it to perfection. So long as it is, so to speak, spontaneous, its followers need no directions; it carries them along, they do not force it. But when its natural vitality is spent, and its followers are no longer borne unwittingly onwards, then spring up more or less gifted observers, who point out the ancient tracks and show how they may be continued; but unless among them be some who know what kind of force went to the making of the tracts, and can kindle the fire to produce the force, all the most accurate and beautiful drawings of those splendid vestigia will not enable one single one to be repeated. Ever since the beginning of the

## SIXTEENTH CENTURY,

that is, for two hundred years before our period, Europe had been studying the footsteps of the Romans. For more than half that time England had thrown herself into the pursuit, and now the patient efforts of many writers were to be rewarded, and it was to be the aim of every generous patron and every Architect of ability to make our English buildings as much like those of Italy as they could. Architectural design was to a matter of rule and compass. What could be easier? The text-books gave the proportions, not only of the modern buildings of Italy—or rather the proportion of the Orders which adorned

them—but also of some ancient ones upon which the sacred eye of Vitruvius himself must have rested. Macaulay has observed that during the latter part of the seventeenth century, and the early part of the eighteenth, the heroic couplet was so much in vogue, and was brought to such perfection by constant use, that every poetaster could employ it with as much facility as Pope himself. So it was in Architectural design. The rules were so well known that it required no genius to use them—nobody expected any skill in planning—and so the same dull propriety

#### CHARACTERISED EVERY BUILDING

that was put up. Just as in poetry it is not the polished form of the verses that marks the true poet, but the ideas contained in them; so in Architecture it is not the correct marshalling of columns, and the "nice conduct" of entablatures that must be our criterion, but the manner in which the whole building satisfies and expresses the wants which it is supposed to supply. Judged by this standard, how many of the designs in Campbell's "Vitruvius Britannicus" would come within the category of true Architecture? And yet those volumes contain nearly all the larger houses built in the first half of the eighteenth century. One of his designs Campbell introduces thus: "This design of my invention in the Theatrical style is most humbly dedicated to Tobiah Jenkyn, Esq." The Theatrical style, he tells us, "admits of more gaiety than is proper either for the Temple or the Palatial style," and in that word *theatrical* lies the key to much of the designing of the period. It is all more or less theatrical, done to impress the beholder; just as in the second half of the century the laying out of gardens and grounds was contrived with the aim of producing the effects found in the pictures of Claude Lorraine and other landscape painters, down even to the introduction of

#### ARTIFICIAL RUINS.

In describing the plan of his house in the theatrical style dedicated to Tobiah Jenkyn, Esq., Campbell dwells not on the convenience of arrangement, not on the cheerful aspect of the rooms or any special contrivance for the comfort of the inhabitants, or whatever goes to make a house a home, but on the proportions of his principal apartments. "Here," says he, "is the double and single cube, the hall being 27ft. by 54ft. Here is 18ft. by 27ft., which is the *sesqui altera*, and 21ft. by 27ft., the *sesqui tertia*, and you pass gradually from the larger to the lesser;" all of which may have satisfied the wants and aspirations of Tobiah Jenkyn, Esq., but do not compensate his descendants for the absence of those arrangements which make daily life tolerable. The needs of daily life went but a little way to model the great houses of that time. Architectural grouping, in order to impress the beholder, often led to dividing the mansion into separate blocks, one for the family rooms and State apartments, one for the kitchens and servants, and one for the stables. The kitchen, therefore, would be hundreds of feet off the dining-room, a drawback against which Evelyn warned his readers, "or else," says he, "besides other inconveniences, perhaps some of the Dishes may straggle by the way." Sometimes the servants' quarters were located in two detached blocks hundreds of feet apart, balancing the composition, of which the family rooms formed the centre, and joined to the latter by open colonades. How the service of the house could be carried on with the two halves of the staff separated from each other by a five or ten minutes' walk is not very clear; but, of course, the mansions were not built for the servants, but a little for the family itself, more for its grand guests, and most for the casual spectator who was to admire the lordly pile as he passed by. The servants had to put up with what accommodation they could get. Their hall might be a vaulted underground room lighted only by areas, as at Buckland in Berkshire, and their bedroom windows might look out on to the back of the parapet. The butler might have to sleep in a room without any outside wall and no direct light and air. But in those

days servants were merely servants, and could hardly expect to be exempt from suffering for Architectural effect when their employers were content to suffer as well, though in less degree. And they must have suffered; for, wholly apart from considerations of bad service, the family were often located in a low basement with all the weight of the State apartments over their heads. Their rooms were not contrived to catch the morning sun, or to get a splendid view, or, indeed, for any particular purpose relating especially to them; but they were arranged to fill up the space beneath the great rooms of State, and if they were comfortable, it was more by

#### GOOD LUCK THAN GOOD MANAGEMENT.

The Architects of those days were, in fact, more or less of amateurs, and the kind of Architecture in demand was such as amateurs could supply. Pre-eminent among them—at any rate in social position—was the Earl of Burlington; and when we consider this fact for a moment, can we be surprised at the amount of unreal and theatrical design that was produced? Who could expect an Earl to concern himself with the niceties of household planning? No wonder that General Wade received that advice from Lord Chesterfield to take a house over against his new mansion, and look at it. Yet all through the century Lord Burlington was looked up to as the greatest patron of Art that England had ever produced, and especially of Architecture. Horace Walpole extols his taste and his ability, he "had every quality of a genius and artist, except envy;" yet, withal, he cannot disguise from himself that Ripley, who was an Architect by occupation (or, as they were still called in those days, a surveyor) "in the mechanic part, and in the disposition of apartments and conveniences, was superior to the Earl himself." Pope, of whom Lord Burlington was a patron, satirizes Ripley more than once, but then Ripley did not belong to Pope's faction. Pope himself, in one of his epistles, points out a way in Architecture which no one seems to have followed, not even the nobleman to whom the epistle was addressed. Writing to Lord Burlington, he says:

You show us Rome was glorious, not profuse,  
And pompous buildings once were things of use.

And again:

Something there is more needful than Expense,  
And something previous ev'n to taste—'tis Sense:  
Good sense, which only is the gift of Heav'n,  
And tho' no science, fairly worth the seven.

Towards the end of the epistle he reverts to the same text:

'Tis use alone that sanctifies Expense;  
And splendour borrows all her days from Sense.

It is rather amusing that a sermon founded on such an excellent text should contain so much that is at variance with it. Nor can we help smiling that the Earl's work should be supposed to embody the principles here laid down, when we remember poor General Wade's house, or the villa at Chiswick, beautiful no doubt in grouping and proportion, but of which Lord Hervey said: "The house was too small to inhabit, and too large to hang to one's watch." Walpole, who records this witticism, has some remarks on the house which are worth repeating. It is "a model of taste," he says, "though not without faults, some of which are occasioned by too strict adherence to rules and symmetry. Such are too many correspondent doors in spaces so contracted; chimnies between windows, and, which is worse, windows between chimnies; and vestibules, however beautiful, yet too little secured from the damps of this climate. . . . The ground apartment is rather a diminutive catacomb, than a library in a northern latitude." Then he adds a few sentences which throw some light on one of the motives that actuated the eighteenth century. "The larger court, dignified by picturesque cedars, and the classic scenery of the small court that unites the old and the new house, are more worth seeing than many fragments of ancient grandeur, which our travellers visit under all the dangers attendant on long voyages." There you have it—"the classic

scenery," and the "fragments of ancient grandeur," which were to be rivalled by

#### ENGLISH VILLAS.

It is from the opinions of men who lived in the eighteenth century that we can best gather the motives that underlay their actions, and, therefore, a further quotation from Walpole may be excused:—"It was in this reign" (of George II.) he says, "that Architecture resumed all her rights. Noble publications of Palladio, Jones, and the antique, recalled her to true principles and correct taste; she found men of genius to execute her rules, and patrons to countenance their labours. She found more, and what Rome could not boast, men of the first rank who contributed to embellish their country by buildings of their own design in the purest style of antique composition." We have seen one of these men of the first rank, Lord Burlington, and what he did. Another was Lord Pembroke, and he is worth singling out because, according to Walpole, "No man had a purer taste in building than Earl Henry, of which he gave a few specimens, besides his work at Wilton." Now his work at the house at Wilton is about as dull as anything can be, and far behind the "theatrical bridge" as Walpole calls it, which he threw over his river. This bridge is less objectionable than the other "theatrical" work of the time, inasmuch as it imposes no special inconvenience on any one, but whether a bridge of this kind is in harmony with English scenery is a debatable question.

#### TASTE,

of course, was the great requisite in that age. Lady Teazle endeavoured to acquire it along with other fashionable accomplishments, to her husband's great scorn—what had she, a country-bred girl, to do with elegant expenses and fashion before she married him? "For my part," replies the lady, "I should think you would like to have your wife thought a woman of taste." "Taste!" cried her husband. "Zounds, Madam, you had no taste when you married me." The extravagances of the second quarter of the eighteenth century sprang from an indulgence in taste apart from considerations of propriety, and it was the often-mentioned Lord Burlington who led to them, partly by his own work and partly by his publication of the designs of Inigo Jones and Palladio's antiquities of Rome. But it only wants a comparison of Inigo Jones's work with that of Burlington and his successors, or a comparison of Wren's with theirs, to see how those two men were really Architects, while the others were but amateurs dabbling in what they did not thoroughly understand, and in other details of which they scorned to enter. But while we cannot but feel that in the true essentials of Architecture they were sadly lacking, yet we must concede that they produced striking results. One of these fine palaces, when it was surrounded by its original gardens, must have been remarkably imposing. Take Blenheim, for instance. If we regard it as a home, we must be disappointed; but as the dwelling of a great noble, living in state and surrounded with all its attendant ceremony, receiving other great nobles with their retinues, and housing them in more magnificence than comfort, in these respects it has much to claim our commendation. There is much excuse for it in the fact that it was a gift from the nation to its greatest son; it had to be splendid at all costs—yet it did not meet universal appreciation even in those days, as witness the lines of Swift.

#### GREAT AS THE PROGRESS

in Architecture has been within the last forty years, it has either been imitative or eclectic. We want it to be neither, for imitation Architecture proclaims that we admit the superiority of our predecessors, and eclecticism is but the pillaging of former Architectures and re-arranging the pieces; while what is wanted is either a new creation or a new and superior development, just as man is a superior development of the monkey, or even as the Apollo Belvedere or the Venus of Milo are superior developments of the average man and woman. I have insisted in these lectures on a much more complete and thorough knowledge

of the Art of construction than at present exists among us; because this is the foundation of our constructive Art, and without a solid foundation no permanent monument will stand, but besides this an accurate knowledge of the strains on certain features gives the proper form they, or parts of them, must take; we saw in Byzantine that the abacus of columns had to be deeper and wider to support larger piers and greater weight; that the capital sometimes had to be cubic and only superficially carved to convey the weight to the shaft. The stone rings to connect the lengths of thin shafts together, in Gothic have been turned into ornamental features. Structural knowledge, however, is far from being all that we want. We know we want this knowledge, and we also know that it may be acquired, but we at least equally want, if we do not more greatly want, creative genius, either to create something new and original or to develop that which has gone before, as Nature does, or has done, in all her works. This power, however, on the aesthetic side we know not how to attain: all we know is that it is the offspring of deep emotions, high aspirations, and untrepid resolves in the nation, acting on certain love and

#### SKILL IN THE ARTISTS.

The successful resistance to the Persian invasion caused all the fine arts in Athens to blossom; and if you will consider the circumstances of the Saracen, Gothic, and Renaissance epochs, you will see that the Arts were forced into blossom by important national achievements; and that the Artists of the period only wanted this stimulus to make them achieve their brilliant successes. As individuals, Artists can only contribute in a small degree to such intellectual upheavals. Their business, however, is to be ready for them. We may hope that in a short time every student will have a thorough acquaintance with construction and materials, and will have learned the art of moulding to suit the climate. We also hope that each student will strive to develop the shaping of forms so as to captivate the most refined taste; so that when the flood comes that will again float the barque of Architecture, so long stranded, they may be ready to man her and steer her to new discoveries and new conquests; so that the twentieth century may be one of the most flourishing Architectural epochs the world has yet seen. In that epoch I feel sure that those who were Royal Academy students will not be

#### THE LEAST CONSPICUOUS.

But when these grandiose ideas were applied to the houses of ordinary noblemen, much as they may have been cherished at the time, those noblemen's descendants find it hard to live in their palaces, and hard to maintain them. There is not time enough on the present occasion to dwell much on the gardens that surrounded these great houses, but they were an acknowledged part of the general design, and now that they have in most cases disappeared, the vast houses lacking their support seem more wanting in common sense than they otherwise would. Among the illustrations in Campbell's "Vitruvius Britannicus," which may be considered as the epitome of the period under discussion, there are not a few showing the lay-outs round the great houses, which were founded partly on Dutch and partly on French examples. It was, however, probably Versailles that set the example to our English nobility, though nothing was done here on so vast a scale. The Duke of Montagu, who was Ambassador at the French Court for a number of years at the end of the seventeenth century, occupied the first few years of the eighteenth, after his return, in erecting his seat at Boughton, in Northamptonshire, after the pattern, and as his dimensions would allow, after the very model of Versailles. It must be admitted that Boughton House is a very plain copy or rather reminiscence of Versailles; at the same time, its garden and wildernesses were of unusual magnificence and size, and adorned with numerous statues and a considerable extent of canals and ornamental water, enlivened by jets d'eau quite in the manner of Versailles as

recorded in prints. The house itself, although of a rather plain and sombre cast, is interesting as an

#### ALMOST UNALTERED EXAMPLE

of an eighteenth century mansion, simply though richly furnished. Its floors are polished, its walls panelled in large panels surrounded by a bold bolection moulding, the doors are lofty and set in thick walls, the chimney-pieces are simple and massive, and surround wide and deeply recessed open fireplaces. The ceilings are (many of them) by that rather dull painter, Verrio; still, they impart a large amount of character to the place. Here and there is a panelled room, or a fine chimney-piece of a hundred years before, showing that the house was not erected entirely new by the ducal ambassador. The walls are hung with ancient portraits and pictures, and the floors are full of ancient furniture. Through the heavy sashes one looks out on to the undulating park, and the long and lofty rows of trees which form part of the celebrated avenues. There are attics innumerable scattered in every direction, and approached by staircases where the handrail is mitred round the plain square newels, and twisted balusters join it to the swelling string. Through these attics you may go, and down a different staircase, to find yourself in a room that you thought was a furlong off on the other side of the house. Altogether an interesting place, and one that gives a good idea of the haphazard arrangement of a large eighteenth century house. At any rate, Boughton House was a home which could be inhabited all the year round—even the state rooms; which is more than can be said of many of its contemporaries. Nevertheless, with all their drawbacks these palaces were stately. The plans look gorgeous on paper, and so do the sections showing the internal decoration. The effect of the places themselves is, perhaps, rather depressing on the ordinary person, the grandeur is a little too obvious—there is no such feeling of homeliness as in the many-panelled rooms of the early seventeenth century; but when all is said, the fact remains that the Architects of the later time had a very definite aim in what they did, and they achieved it. When we leave the mansions of the nobility, and come down to the houses of the squire or the well-to-do merchant, we find ourselves in a much pleasanter atmosphere. They have a

#### QUIET DIGNITY

about them which is decidedly restful and attractive, especially those of the first quarter of the century. In later times the portico idea became too prevalent, which consisted in affixing to the front of an otherwise plain house some variation of the columned front of an ancient temple. But the earlier houses with wide corniced eaves, simple horizontal strings dividing the rows of sash windows, and combining with the quoins that emphasise the angles; these will no doubt long continue to form the model for houses of similar use and capacity. It is just a question whether this is quite the type that suits the present age; for our wants seem to grow always more complex, and to require a more elastic style than one depending for its effect on strict symmetry and unbroken horizontal lines. If we cannot take a wholly sympathetic view of the purely Architectural work of the eighteenth century—at any rate, in its more notable examples—neither can we forget that we are indebted to it for much that is suggestive in the work that embellished the Architecture, especially in wood and iron. The ironwork of that period has

#### NEVER BEEN EQUALLED

in England, and it lends an air of distinction not only to great houses like Drayton, in Northamptonshire, but to little suburban villas at Hampstead. The joiner's work of the time is full of suggestions. The sash-windows alone were enough to revolutionise Architectural treatment, and the far-reaching effects of a mitred moulding are impossible to follow. Through all the changes of two centuries these two facts have remained with us—sash windows

and mitred mouldings—and there seems no immediate prospect of their being superseded. The work of the plasterer was not so admirable as that of the joiner. He had become too expert, and was able to perform prodigies of modelling and high relief, which finally undid him, and he and his Art perished together. If we are to seek inspiration from the work of the eighteenth century, we shall find it in two directions. First, in the grand schemes of house and garden combined, and in the general grandeur of treatment bestowed upon the great houses of the time. Not that we are to copy either blindly; but it is very desirable to realise how much the house and its surroundings depend upon each other; and equally desirable to learn how a grandeur of manner may be acquired. Secondly, in the sober and simple houses, where the plainness of the general appearance is sometimes unexpectedly broken by the quaint treatment of a door or a chimney, and where the joiner's work is full of homely lessons. It is often from the vernacular Architecture of the country that we can get the most useful hints; whereas it is the palatial Architecture that gives its stamp to the period, and goes to furnish the text-books. The one is for show first, and use second; the other is for use first, and show second. The palatial Architecture of the eighteenth century was surely given to us more as a warning than as an example; but it is worthy of attention, just as all phases of Architecture are which have acquired any hold on public affection, and we are not likely, in view of our present methods of study, to fall into that attitude of mind towards any style which Evelyn exhibited towards Gothic. If we bear in mind that Architecture must develop from within, and not from without, we shall never again become the slaves of a foreign and a dead hand, as our forefathers were in the eighteenth century, but we shall go forward, as we are, indeed, at the present time going forward, on different paths, perhaps, and at different rates of speed—sometimes not without sharp divergence of opinion as to the propriety of particular steps—but always towards the same goal—the ennobling of our *Alma Mater*, the Mother-Art of the world.

A NEW Church is proposed at West Bromwich, for the building of which £7000 is required.

It has been decided to open a subscription list for the erection of a home for trained nurses at Westminster.

The building trade at Llanelly just now is in a very depressed state, scores of the men being out of employment, while others are only working part time. For the present all building operations appear to be suspended, and there are no signs of any important contracts being given out in the near future.

The Society of Antiquaries, on the motion of the Rev. G. W. Minns, seconded by Sir Samuel Montagu, Bart., M.P., has passed a resolution urging upon the local authorities of Southampton the importance of preserving ancient landmarks of historic interest, while the scheme for the removal of certain dilapidated buildings to ensure the sanitary welfare of the Borough is in progress.

SEVERAL experimental runs have been made in the streets of London with a motor car which is fitted with the Wellington Ignition Tubes. The result has so far been to show that these tubes, which are composed of a combination of earthenware and asbestos, in preference to wrought iron, may turn out valuable auxiliaries in propelling horseless vehicles. They have already been adapted with success to various forms of gas-engines.

THE primary steps towards the erection of a fort on the eastern extremity of Bere Island are in progress. Material has arrived for fencing round the works, and a number of men have been employed repairing the approach from the landing place. The area of the present operations will include an old Martello tower, commonly called No. 1, which will be demolished to be superseded by earthwork fortifications of the present time. About three years will be occupied in the erection of the fort.

## THE SERVICE OF ART.\*

By RICHARD SEAVER, M.A.

ARE there not many amongst us who regard the phrase "The Service of Art" as in itself a contradiction? What possible service, they ask, can Art render? It may supply amusement, a mode of passing time for the well-to-do classes and the dilettante, but for any of the really practical purposes of life it can and does render no service: it is useless. So they repeat the words which have not after nineteen centuries lost their querulous, captious note, "To what purpose is this waste?" What answer can "The Service of Art" make to objection such as this? Observe that oft-repeated phrase, "The really practical purposes of life." The kernel of the matter lies here. Utility, it is said, ought to be always the end of expenditure. Is there, then, only one utility in relation to the welfare of man? Must all expenditure increase their material happiness? Are we never doing man good, except when we are providing for his outward wants or enabling him to get on in the world? Remember Ruskin's indignant outburst against this utilitarian spirit: "Hewers of wood and drawers of water! who think that it is to give them wood to hew and water to draw that the forests cover the mountains like the shadow of God, and the great rivers move like His eternity." The beauty of nature which Art seeks to reveal

## IS NOT AN ACCIDENTAL THING,

nor mere appendage added as an afterthought, as the decorations of modern Architecture too frequently and palpably are. Beauty is wrought into her very warp and woof. Nature has a spiritual as well as a material side. She exists not only for the natural uses of the body, but also for the sustenance of the soul. This higher ministry explains all the beauty and wonder of the world which would otherwise be superfluous and extravagant. As the servant of merely household wants she might have been clothed with homely russet garments girded for toil, but as the priestess of heaven, appealing to the higher faculties of man, she is clothed like Aaron with temple vestments, and Solomon in all his glory is not arrayed like her. What need is there, then, for the service of Art if Nature herself chant her own song, unfold daily her splendid pageantry, her inimitable pathos? Why not cultivate the imagination by bringing it face to face with Nature rather than in second-hand contact with man's copy of Nature? Why send men to picture galleries, even to a National Academy of Art, when for themselves they may listen to "the still small voice of the level twilight behind purple hills," or watch "the scarlet arch of dawn over the dark troublous-edged sea"? Just because all men have not eyes to see nor ears to hear. The true painter is seer and revealer,

## INTERPRETING NATURE

to us. He is no mere copyist nor reproducer. In a very real sense he sees "that light which never was on sea or land, the inspiration and the poet's dream." So it is in portraiture also. Oh, the wearisome inane of those conventional, faultless, complacently correct likenesses in presentation portraits! The man's clothes are there—generally his Sunday best—his gold watch chain is also in conspicuous evidence, and his smile or frown, and attitude unmistakable of the "sitter." But too often the man is not there. He lurks out of sight behind all that specious show. Indeed, he may himself be ignorant as to where he is really to be found. The genuine Artist knows. He has sought out the soul behind the flesh, the depth of the mystery of its peculiar and separating attributes, and if he be true to his craft, like the portrait painters of olden time, he neglects the mask and paints the man. No wonder that sometimes men start back in horror at this disclosure of their inner selves, as one did in an upper room when the as yet unrealised workings of his own soul were laid bare to him, "Master, is it I?" "This power," says Ruskin, "to see and to feel which dis-

tinguishes the true Artist is instinctive; it cannot be manufactured. You may train it or destroy it; but make it or acquire it—never." When we cultivate the

## REALISM IN ART

let it be the realism of humanity at its highest, not at its lowest point. To paint the foulness of the brute is to be false to realism, for man in this stage is unnatural, unreal, less than man. The mind sees only that which it brings with it—the power to see. Some find it hard to believe that a useful thing can be a beautiful thing, the underlying idea being that the more you increase the beauty of the necessary things of life the more you lessen the utility, whereas Art began in the decoration of articles of daily use. "Put fine furniture if you like in my drawing-room, but I am a plain man, and like useful things in my parlour." This is to stifle and degrade Art, separating it from life. The savage lovingly carves the paddle of his canoe, which he puts to daily use. The splendid Gothic arch grew from the glorified household roof. As William Morris says, "The web, the cup, and the knife should look as lovely as the green field, the river bank, or the mountain flint."

## RUSKIN LONG AGO

pointed out that we don't as a nation seem likely to be able to rival some of the Continental people in Artistic work. The reasons are external and local as well as internal and constitutional. We have not the swift vivacity of mind or the freedom from oppressive anxieties, or the circumstances either of natural scenery or of daily life, causing pleasurable excitement, which seem essential to excellence in decorative design. On the Continent, again, in Italy and France and Germany, powers of fancy, stimulated by precision of manual dexterity, have descended uninterruptedly from generation to generation, with the natural result of producing almost a new species of the Art genus, with whose instinctive gifts we have no chance of contending. So, as Ruskin bids us, we must first learn to make honest English wares and afterwards to decorate them as it may please the approving graces. Also in the highest field of ideal Art, according to the same authority, we shall never be successful, owing to that characteristic Saxon delight in the forms of the burlesque which are connected in some degree with the foulness of evil. Much, however, we can do that others cannot. In the fields of portraiture witness our Reynolds and Gainsborough; in animal painting witness Landseer; and in landscape, where Turner is supreme. Surely if this be so, of all national duties the education of the Artist should be most incumbent upon the State. Yet of nothing has our country at least been more neglectful. The Artist has for the most part been left to grow. How different in what we complacently style the days of pagan Greece! The real value, says Emerson, of the *Iliad* or Raphael's Transfiguration is as signs of power, billows or ripples they are of the sea of tendency, tokens of the everlasting effort to produce which even in its worst state the tone betrays. Art has not yet come to its maturity if it do not put itself abreast with the most potent influences of the world, if it is not practical and moral, if it do not stand in connection with the conscience, if it do not make the poor and uncultivated feel that it addresses them with voice of lofty cheer.

## DEBASED ART

makes the same effort which a sensual prosperity makes: to detach the beautiful from the useful; to do the work as unavoidable, and, hating it, pass on to enjoyment. As soon as beauty is sought, not as God's sacrament and from love, but for pleasure, it degrades the seeker. High beauty is no longer attainable by such; only an effeminate, prudent, sickly thing, which is not beauty, for the hand can never execute anything higher than the character can inspire. Beauty will not come at the call of a Legislature, nor repeat in England its history in Italy or Greece. It will come, as always, unannounced, and spring up between the feet of brave and earnest men. There should be no distinction between the

fine and the useful Arts. If life were nobly spent, it would no longer be possible to distinguish the one from the other. In Nature all is beautiful and all is useful. It is in vain that we look for genius to reiterate its miracles in the old Arts; it is its instinct to find beauty and holiness in new and necessary facts, in the field and roadside, in the shop and the mill. If this be not so in our modern Art, then its service has become disservice, and Art stands in the imagination as somewhat contrary to Nature, and struck with death from the first. "The Service of Art," then, is a true service of humanity. The great Artist touches universal chords; his pictures pierce directly to the simple and the true.

## KEYSTONES.

The Leamington Court of Governors of the Warneford Hospital has decided to adopt a scheme for extending the hospital. This will cost £10,000.

MR. DANIEL WATNEY, the president, has given a donation of £450 to the Surveyors' Institution for the purpose of founding a Forestry Scholarship.

An order, authorising the expenditure of £110,000 in erecting and equipping a new asylum at Gransha for the Londonderry district, has just been issued.

The tender of a Liverpool firm has been accepted for the alteration and enlargement of the second court at the Dale Street Police Buildings, at a cost of nearly £2000.

The new police-station, law courts, and mining school, erected by the Warwickshire County Council at Nuneaton, at a cost of nearly £10,000, were opened on the 5th inst.

OPERATIONS have been begun in connection with the taking down of the pedestals of the Coats statues at the Cross, Paisley. The stones will be taken to Edinburgh to be re-touched.

It is understood that support to the extent of £4000 has been promised towards the cost, which is estimated at £12,000, of erecting Unionist Club Buildings in Union-terrace, Aberdeen.

A CURIOUS discovery has resulted from Canon Wilberforce having no use for the cellar beneath his residence in Dean's Yard. Its new owner asked an Architect to inspect it with a view to its conversion to other uses, and his investigations resulted in bringing to light a fine Gothic apartment capable of holding thirty people. It will in future be used as a dining-room.

At the junction of the Langley-road with Great Bath-road, opposite the Jesuits' College, now unoccupied, and at the entrance to Slough from London, stood a large ornamental fountain of bronze and marble. Some thieves have succeeded in removing this from its base and carrying it off. The fountain, which was of elegant design, stood about 14ft. high, weighed several hundred-weight, and was very valuable. It is supposed to have been stolen for its bronze and marble.

THE new Chapel of the Female Convict Prison at Aylesbury was recently consecrated by the Bishop of Reading. Her Majesty's Commissioners of Prisons have provided a spacious and well-lighted building, the walls being distempered in cream tone, with dado of dark red-brown, and the pulpit and reading desk of unpolished oak. The Duchess of Bedford gave the altar hangings, dossal and frontal in rich cardinal damask, as well as a golden cross and vases.

THE annual exhibition at Sheffield of the prize drawings of the Royal Institute of British Architects was opened on the 9th inst. The collection comprises the premiated drawings selected for exhibition in the provinces during the coming months under the auspices of the allied societies. The collection is further augmented by 25 sheets of studies submitted by candidates for admission to the Institute examinations of 1896, including seven sheets by H. L. Anderson for the intermediate examination, and five sheets respectively by Messrs. A. G. Boyd and G. W. Fraser and eight by C. S. F. Palmer for the final examination.

\* A lecture delivered before the members of the Belfast Art Society.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
March 24th, 1897.

"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."—JOHN RUSKIN.

In viewing the last collection of the works of Du Maurier at the Gallery of the Fine Art Society in New Bond Street, one cannot help being struck with the surprising industry, besides the power and versatility, of the Artist. This we believe is the third exhibition of his drawings held at these rooms, and comprises the principal work of the last six years of his life. There are considerably over two hundred drawings on the walls, over and above those for which no hanging space could be found, and nearly every one of these is worth prolonged study. Probably no Artist made so steady an advance in his Art as Du Maurier. If you compare even the least successful of his drawings with his early contributions to Punch, the fact will be evident. The delicacy of the drawing, the beauty of design, and the refinement of satire have become intensified of recent years, and there is but little doubt that some of his best work was done but a few weeks before his death. As an example of elaborate and beautiful pen-work may be mentioned one that does not in any way belong to the humorous group, namely the delicately-wrought drawing "Nocturne." A peculiar phase of the Artist's humour—when he seemed to absolutely revel in a weird of imagination—may be seen in the fourteen pictures entitled "Illustrations to a Dream," and then we find something in an altogether different line in his drawings for "Esmond." In the various episodes connected with "Things one would rather have expressed differently," "Speeches to be lived down if possible," and "Things one would rather have left unsaid," do we meet many old friends whom we are glad to encounter once more. In "Casuistic Ingenuity" we have a charming and juvenile adaption of "The Fox and the Crow" scene in "Trilby"; and what truth there is in "Chivalry in the London Streets," where all the men are charging into an omnibus on a rainy day to the exclusion of the ladies. "Trials of a Painter's Wife," "Dancing Men," "A Daughter of Heth," "A Home Truth," "The Height of Impropriety," and "L'Invitation à la Valse," are among the many delightful comedies of society to be found in this collection.

MANY inadequate reasons have from time to time been put forward by Ecclesiastical authorities for defacing, under the name of restoration, the buildings committed to their charge, but if we may trust a correspondent who writes from Bath, we have met with none so audacious as that which appears to be prompting certain officials of that town to press for the restoration of its picturesque old Abbey. With true want of Artistic enlightenment, the citizens of Bath have, we are told, for some time past been engaged in spoiling the view of the Abbey. New municipal buildings have been erected on its north side, and an extension of the Pump Room has been built much closer to the west front than was either needful or desirable, while at the east end of the Church the corporation is busily

engaged in putting new stucco fronts to a row of shops. The Abbey, therefore, looks down all around on brand new surroundings, and the local feeling seems to be that the west front of the Abbey must undergo restoration in order to be brought into "harmony" with these. There is not even the excuse of structural unsoundness put forward; it is simply a desire to encumber the fine old front with modern masonry. As nothing, fortunately, has yet been done, there may be time to stay the hand of the spoiler. But the most outrageous feature of this threatened act of vandalism is that it is gravely put forward as a proposal for commemorating the Queen's long reign!

In the March "Cornhill," Giovanni Costa, who was for nearly half a century in friendly and artistic intercourse with the late P.R.A., tells what Leighton did for George Mason, "the glory of English Art." Mason was living almost in misery, hidden from the world and burdened with children. Leighton went to him in his solitude (1863), took him with him, and showed him the beauties of the "Black Country," making in a little sketch-book drawings of schemes for future pictures. "It was as if he reopened his eyes and inspired him with new life. At the same time, and with the greatest delicacy, he supplied him with money in advance on the pictures he commissioned from him for himself and for his friends." On Leighton's return to London from his visit he secured mention of Mason in the Press, and spoke much of him in the Artistic world and to Artists. He also prepared his house in London, and from that time he never abandoned him, always helping him, giving him courage, advice, and money. Mason died in 1873, leaving a widow and several children without any resources. Leighton arranged the sale of all the pictures, studies, and effects of his friend, and from the proceeds of this sale he obtained for them an annual income at that time of £600. "That which he did for Mason," it is added, "he did for many other Artists."

CONSIDERABLE interest has been taken in a block of wood which has found its way into one of the corridors of the House. It is a portion of a beam taken from the crypt of Canterbury Cathedral, which is undergoing restoration at the hands of the new Dean. The relic is of pale snuff brown, but really resembles a piece of fine sponge or a block of honeycomb. The wood has been eaten into by myriads of worms, whose tiny cells are in themselves singularly beautiful from their minuteness and integrity. Two of these insects were secured alive, and are now under a glass case, in the room of one of the officials of the House. The beam is said to be fourteen hundred years old. It is called oak, but more probably it is a piece of cedar. Any way its Archaeological value is considerable.

"CONTESTS for Art Scholarships are by no means so equitable as they ought to be," says a correspondent. "In the conditions required by competitors for the County Council Scholarships there are certain conditions wisely designed to ensure to those for whom these scholarships are provided so that they shall not be handicapped by entry of those who are well-to-do or unscrupulous. One condition is that no scholar shall compete whose parents' earnings or income from any source shall exceed £400 per annum, and another rule is that the sketches put in shall all be the scholars' own work and design, and have been designed and executed within a given period (about one month) of the date of examination. There are about 400 or more entered for the examinations for 20 scholarships coming on in about a fortnight at the London County Council. I am in a position to know that some of these competitors have parents whose incomes exceed the limits; and that designs and work of others executed many months ago will complete. As a needy father of a hard-working and poor competitor, I ask whether any and what steps are taken by the management of these competitions to ensure adequate investigation of the entry papers sent in, and

rigid exaction of the conditions framed by that management for the conduct of the examination for these scholarships."

THE locomotive "Invicta," one of the earliest in the history of railways, and the first engine of that pioneer Kentish line, the "Canterbury and Whitstable Railway," is to be permanently placed on exhibition at the Charing Cross Station of the South Eastern Railway. It will be brought up from the Ashford works, where it has been for many years past, and will be as interesting an exhibit as are the "Puffing Billy" on Newcastle High Level Bridge and the "Locomotion" on its pedestal at Darlington station. The "Canterbury and Whitstable Railway" was opened May 3, 1830, and the "Invicta," therefore, has long since passed its Jubilee. It was exhibited at the Railway Jubilee at Darlington in 1875, and at the George Stephenson Centenary in 1881. It is announced also that the Great Western directors have presented the first Great Western engine, the "North Star," to the South Kensington Museum. It was delivered to the Great Western Railway in 1837, and ran successfully for many years, but has long been stored away in a corner of the engine-sheds at Swindon. It will probably be shortly transferred to the museum, where it will be in company with many another curiosity of early railway times.

THE great city of Ambir, once the capital of Rajputana and founded in the first century of the Christian era, was so magnificently built that none of its palaces or public buildings have yet fallen into ruin or decay. The Royal palace is 100ft. above the level of the lake, but the stone buttresses which support the sides of the green hill upon which it stands descend perpendicularly into the water and look like a continuation of the castle walls, which are built exactly over them, thus making the frontage appear more than 200ft. high. The principal gateway of the palace, known as the "soëvé" gate, is acknowledged to be one of the most beautiful works of Art in India. It is difficult to convey any idea of this marvellous construction of precious marbles and of gildings, of mosaics and of delicate painting. The marble frameworks of the windows which ornament this gate are the finest in all India. They are carved out of single slabs of marble, and are most delicately finished. On passing through this gateway one finds a courtyard surrounded by palaces, each rich in mosaics and sculptures. In some of these palaces the walls are covered from the ceiling to the floor with inlaid work of polished stone, agates, turquoises, and pieces of looking-glass arranged in groups of flowers and Arabesques, and the effect produced by a ray of sunshine in these apartments is indescribable. In others the floors are of sandal and other precious wood.

A CORRESPONDENT, writing with reference to the sinking of Maitland Park, says that having resided in Maitland Park, Haverstock Hill, for some years, he has had an opportunity of observing a continuous sinking going on throughout the park—notably in Maitland Park Villas. "Two houses close to one of the park entrances and next to a chapel have recently been condemned by the local authorities and pulled down. Others, sooner or later, can hardly fail to share the same fate. There does not seem to be a single dwelling in the park which is free from the disturbing influence. The house I have occupied had not been long replastered and repapered when large rents in the walls and ceilings reappeared. My next-door neighbour, when I mentioned the circumstance to him, said, 'As your house sinks it pulls mine with it.' I had not been long in the place before the gradual subsidence was found to force apart the joints of the drainage pipes underground, the result being that the back kitchen and back yard had to be dug up for the repair of the pipes. As this sinking has been in progress for years it is feared to be only a question of time when a catastrophe will compel the County Council to demolish those houses, especially those which are of the 'jerry-built' order, in the villas and the road."

THE memorial chancel and organ chamber of the Parish Church of Dundonald, Ireland, were consecrated a few days ago. During the building operations a most interesting "Archæological find" was made, which confirms the traditions as to the early Ecclesiastical importance of the site. In taking down the stonework of the old box chancel, which was built in the early decades of the present century, some of the stones which had been used therein as mere building material in the construction of the chancel arch were found to be the floriated portions of an Anglo-Norman tombstone, of uniform shape, similar to those whose vestiges yet remain at Grey Abbey and Movilla. In proximity to this relic there was also found the cusped head of a fifteenth century Church window. These vestiges have been happily rescued from oblivion, and are *en evidence* in the new structure. Parish records tell us it was rebuilt in 1771 and again reconstructed in the year 1866. It was probably at this latter date that the existing cast-iron roof principles of the nave were inserted, and other corresponding instances of the want of taste in Ecclesiastical detail which obtained in the early part of the century. The gradual improvement of the Church within the last year, the clearing away of the dowdy enclosures or pews, the new chancel and sanctuary, with the exquisite stone pulpit and memorial windows, have all effected a complete transformation. The sanctuary has been paved with special mosaics, the walls have been panelled in pitch pine and walnut, the panelling over the holy table being in Ebners' mosaics. The chancel and choir has been extended one bay into the nave, and a chancel arch has been built springing from corbel clusters, and with three orders of mouldings. A new cut stone entrance doorway to the tower has been built, and is richly moulded with label and carved corbels and Gothic panelled door. The entire works have been carried out by Mr. Joseph Smyth, builder, of Duncairn Gardens, from the plans and designs of Messrs. J. J. Phillips and Son, Architects, Belfast.

MR. JOHN D. ENYS, Penryn, who recently gave a lecture on "The Ancient Churches of Cornwall," said that a large number of Churches were built in the perpendicular style, which came in after the great plague of 1349, the majority of the present Cornish Churches dating from after the year 1350. The typical Cornish Church had three aisles. One of the most curious Churches in Cornwall was Crantock, having a nave but no aisle. The chancel, however, had two aisles. Crantock had a collegiate established prior to the reign of the Conqueror, and this remained until the time of Henry VIII. Usually in Cornish Churches there were no chancel arches to be found, the chancel being formed by a rude screen. On the top arcade of the nave there were, as a rule, no windows, except at St. Germans and Fowey, but the Norman remains, the fonts, are most interesting, and not a single scrap of Norman work in the country was granite. The Normans did not use chisels, but their carving was done with the axe. Some of the old Norman fonts showed traces of old Saxon design. The font at Feock was one of the purest old Norman fonts known in Cornwall. The one at Perranzabuloe had a curious look, as those who made it imitated some former design. Lostwithiel had a font which bore some very rude carving. One of the oldest towers in the county might be seen at Kea, whilst Gwithian, Breage, Lelant, St. Ives, Redruth, and Camborne had towers which existed for several centuries. Of monuments of great antiquity there were few in Cornwall, but there were several stoneheads. Of painted glass little remained except at the Church at St. Neot.

THE widening of Fleet Street is to be continued, and the total cost will amount to something like a million sterling. The improvement, however, will be worth even that high figure, for it is one of the busiest and narrowest of City streets. No doubt the setting back of the south or river side of the road will be followed by improvements in the Architecture

of the new buildings and the shabby little shops. It is a matter for satisfaction that there is now an obvious desire on the part of the authorities to pay more attention to the widening and improvement of some of the busy thoroughfares which at present, as far as their breadth is concerned, are mere lanes, ever blocked with traffic, and almost daily the scene of more or less serious accidents.

In a lecture just delivered before the Liverpool Teachers' Guild of University College, on "Old Architecture in Liverpool," Professor F. M. Simpson, M.A., dealt chiefly with eighteenth century Architecture. Rows of houses were built on what were then outskirts, but are now in the middle of the town. Such houses are found in Great George Square, Hanover and Duke Streets, Islington, St. Anne Street, and St. Paul's Square. Round the Cathedral the best old houses are seen, though many of them have been knocked down to make room for modern warehouses. The lecturer described the appearance of these eighteenth century houses, which, externally, are plain, even severe. The one rich spot which attracts the eye is the doorway, and, although the principle is the same in all, the variety in design, slight as it is, is positively amazing. In front of the house were generally cast-iron railings and ornamental lamp standards, often masterpieces of the smith's craft. But, throughout all, the feeling left upon the mind is very impressive, on account of the good proportions of their different parts. This effect is produced by the size and shape of the windows. They were buildings suited to the people who lived in them, and to the times in which they lived—simple but stately, plain but refined. Professor Simpson then showed a series of slides, first of the Strozzi and Antinori Palaces in Florence, as examples of good proportion and discreet use of ornament. Photographs of well-known old houses were also shown, to illustrate the beauty of the eighteenth century doorways, steps, gables, and iron railings.

EXCAVATIONS have been resumed on the site in Bailgate, Lincoln, where broken columns of the Roman period have from time to time been unearthed. The base of a triple column was recently revealed, from which it appears that the nineteen pillars of the basilica or hall of justice were composed of thirteen single and five double columns, and one triple. The triple column unearthed is of like character with the others. Two of the pillars stand north and south, like the other twin columns, and the third has a western aspect. The double column first brought to light was at the time of its discovery thought to be a unique feature, and was regarded as an afterthought of the builder, introduced to remedy some failure in the architrave of the portico. When other double columns were found, however, they were regarded as a local Architectural feature, introduced with the view of giving an air of strength and solidity to the corners of the building. This theory, which was held by the late Precentor Venables, is strongly supported by this latest discovery of a triple column.

THE great building scheme of the London County Council in Shoreditch is making rapid advance, and with the occupancy of the next two blocks, now ready for tenants, somewhere about 2500 people will have been housed of the 4700 originally planned for. Altogether this "Boundary Street" scheme will comprise twenty-three blocks. Of these fourteen are now finished, and of the other nine four are actually in hand and plans have been passed for the remaining five. The laying out and planting of the great circular mound which forms the centre of the estate is now proceeding. This raised garden is to be crowned by a handsome bandstand, around which there will be a broad promenade. Half way between this and the road level another walk encircles the garden, the slopes above and below being laid with turf and planted with shrubs. To anyone who knew the great maze of ruinous

and pestilential slums formerly occupying this site, the transformation is a very striking one.

THE ultimate destination of the three famous canvases which are now hanging in the room set apart for the Standing Committee on Trade is to be one of the public galleries, either in London or in the provinces. These pictures, which are by G. F. Watts, Cross, and Pickersgill, have been stowed away since 1895, and it is a remarkable fact that during the régime of the last Government, Lord Rosebery was instrumental in unearthing from Downing Street the five beautiful pieces of tapestry which are a conspicuous feature at the Foreign Office, where they have attracted widespread attention.

THE collection of military and naval relics in the museum of the United Service Institution has received a notable addition. In five large cases there are now exhibited by the officers of the Royal Engineers a varied collection of relics of General Gordon. The objects illustrate his career from the time that he was a cadet at the Royal Military Academy down to the closing scene of his life in the Soudan. In one of the cases is a series of drawings in pencil and in water-colour made by Gordon when he was at the Royal Academy. One is marked "Near Sorrento, R.M. Academy, Oct. 24th, 1850," and another, called "Old Sarum," dated in the following year, shows an earnest effort at Turner-esque effect in the sky. Later examples give unmistakable evidence of a decided gift for landscape painting. Among the drawings is one which illustrates the well-known interest which Gordon took in Old Testament topography. Another extremely interesting map is that which he made and used during the campaign of the "Ever Victorious Army" in China.

MR. JOHN TWEED, sculptor, is now hard at work upon a series of huge panels, a commission given him by Mr. Cecil Rhodes, for the commemoration of the stand and death of Major Wilson and his little force who were annihilated in the vicinity of the Shangani river. Amidst the rocky monoliths and mighty boulders of Zimbabwe a vault is to be carved in the breast of the almost impregnable ironstone; and there together, as they fell, will the bones of the dead men lie. In the sides of a huge boulder, hollowed to receive them, will be inlaid the four bronze panels upon which Mr. Tweed is now engaged, each 14ft. in length and 7ft. in height, bearing in bold relief the faithful likeness and life-size representation of the thirty-six men, effectively grouped, and garbed in the uniform they had worn with so much credit.

At Guy's Hospital, the new and extensive laboratories, to be opened by the Prince of Wales in May, will shortly be out of the contractor's hands. All the latest improvements have been introduced in the new building, which contains a spacious lecture theatre to accommodate six hundred students. The old laboratories are to be pulled down, leaving a wide open space upon which the windows of the wards on that side of the hospital will look out. An outlay of £13,000 has been expended in the additions, and a further sum of £35,000 will, it is estimated, be required before the plans of additional laboratories now approved by the hospital authorities can be carried out in their entirety. But as such buildings are erected solely on the students' fees, it is likely, excluding the possibility of a handsome gift, to be some considerable time before the work is put in hand.

At Margate there is a remarkable relic of the past about which very little apparently is known. It is an underground cavern, or grotto, whose walls are lined with shells. This grotto is described by Mr. J. Malcolm Fraser. Speaking of his visit of inspection, Mr. Fraser says: "We pass through a rough hewn passage, some 100ft. long, which suddenly emerges into the so-called grotto. Gas has been laid throughout the whole route, and as burner

after burner is lighted, the beauty and elegance of one of the most fantastic relics of the Pagan period reveal themselves. A large central column, supporting the arched roof, discloses a marvel of Architectural design, eclipsing even the Alhambraian mosaic work. Innumerable panels—perfectly proportioned—line the walls, the columns, and the arches of the cave—each panel beautifully finished—each most perfect in design—all different. Roses with buds, flowers, stems, and leaves may all be seen exquisitely worked in shells of different forms and colours. Vines, with small white grapes intermingled with large black muscatels, swords and shields, fishes and birds, all tastefully arranged and carried out. The shells used in the decoration of this wonderful cavern are those which may ordinarily be found on the beach of any of our British watering places. The cement in which they have been fixed, moreover, is exactly similar to the celebrated Roman cement of Dover Castle. Now, Dover Castle was originally a Roman fortress, and has gradually arisen from Anglo-Saxon and Norman work. The Paphos, or light tower, for instance, is entirely of Early Roman Architecture, so that it is safe to say that the grotto is very nearly 2000 years old."

At the recent sale in Paris of the Japanese and Chinese collections of the Brothers Goncourt, small Chinese vases realised from 2000fr. to 2500fr., while a delicate little cup in eggshell porcelain with minute paintings fetched 1600fr. The aggregate amount was 46,700fr., a large sum considering the smallness of the objects. The general result, however, is likely to fall short of expectations, for it is now estimated that the entire collections and house put together will not exceed 1,200,000fr. This, after expenses have been deducted, will give, if there are ten Academicians, about 3000fr. each in lieu of the 6000fr. calculated by the testator. But this sum is larger than that given by the French Academy.

A DEEPLY-ROOTED Artistic belief is sadly shaken by a case in the Greenwich County Court before the Deputy-Judge. It is part and parcel of our Art to believe that in fine mosaic work, Italians are far superior to our own workmen, and are therefore to be employed in preference. This is no longer so. The foreigners may be good enough for mending holes in asphalt pavements, but for laying down mosaics they are no use, as their employer in Greenwich found to his cost. Messrs. Carter, builders, sued Mr. Fearon, of Folkestone, for £22, the amount of a bill incurred for Artistic work of the kind mentioned; while, on the other hand, Mr. Fearon counter-claimed £7 9s. 11d. as the estimated cost of putting right what the Italian Artists employed by the plaintiffs spoiled. It was stated that these wily descendants of Michael Angelo undertook work of which they knew little or nothing, on the off-chance that the inartistic eyes of Englishmen would fail to find out the defects. They, however, carried their audacity too far when in a mosaic they left a hole worthy of the asphalt in Holborn. Several Italians were called as witnesses, and protested that the work they performed was worthy to rank among the immortal productions of Venice and Rome. They believed so because on one occasion Mr. Fearon, of whose vituperation they were now the object, stood them a drink. True, there was a hole in the mosaics, but that could easily be filled up.—The Judge held that the work had been improperly done by the foreigners, and therefore gave judgment for the defendant. He also allowed Mr. Fearon 16s. 9d. on the counter-claim, to enable him to fill up the hiatus left by the Italians.

An article recently appearing in the "Pall Mall Gazette" on the technical education in Sheffield, stated that the Technical School, admirable as it is in plan and equipment, numbers only about 700 students all told. The quality of the instruction given, indeed, would seem to be in inverse ratio to the quantity who are to receive it. With the steel industry first and the rest nowhere the organisers of the

school, which had its origin in Firth College and dates from 1886, had an easy task in comparison with other cities where no trade has such exclusive possession. They have been able unhesitatingly to concentrate nearly all their resources on the teaching of subjects which enter into the making of steel and of articles in that metal. You consequently find that the rather ugly buildings in St. George's Square consist, apart from lecture-rooms, of laboratories, workshops, and foundries in which the students blend the theory with the practice of metallurgy and engineering. The practical aspect of the training is severely maintained. The day students, for instance, are required to work in twelve-hour shifts for the two or three weeks in each term during which the furnaces are at work, having a labourer's assistance only for the roughest work. If any addition to the plant is required—a new engine or boiler, for instance—it is made by the students themselves, under the direction of the school professors. So much steel is produced in the course of a year, that its disposal is a matter of some difficulty. It was proposed that the school should supply the Corporation with steel, but this proposal offended the contractors, and was consequently not adopted.

THE Aberdeen Diocesan Association recently paid a visit to the east and west Parish Churches, or more properly the St. Nicholas Church of Aberdeen, under the guidance of Rev. Dr. Cooper. Dr. Cooper explained how Drum's aisle formed the centre of the ancient Church of St. Nicholas, the first mention of which occurred in the twelfth century. The Church, with its choir of six bays and nave of eight bays, occupied a larger area than the present east and west Churches do, being one of the longest Churches in the country. The various points of interest in Collinson's aisle were pointed out, after which the visitors entered the west Church, built in 1751, from designs by James Gibb. The tapestries in the west Church, the Liddel memorial brass, and the stone effigies claimed and received full attention from the party, who, leaving by the west door, went round the north side of the building to St. Mary's Chapel, or the lower Church of St. Nicholas, which, owing to the slope of the ground, was built to support the St. Nicholas Church proper. Only two other similar lower Churches exist in Scotland, namely, at Glasgow and Roslin. The lower Church of St. Nicholas was used last century as a prison for witches, and an iron staple can still be seen in one of the pillars to which these unhappy victims of ignorance were chained. Not of the least interest in the chapel are the carved panels of the seats, which, though now varnished, were originally picked out in various colours. Dr. Cooper hopes when his scheme for the restoration of the chapel is completed, to have the panels again painted, presenting the unique appearance that they must once have had.

THE last of the series of fortnightly Art lectures for the season, given in the Glasgow Corporation Galleries, was delivered by Mr. D. Y. Cameron, whose subject was "Three Great Etchers—Rembrandt, Meryon, and Whistler." Mr. Cameron said it was now generally admitted that the three great masters of etching were Rembrandt, Meryon, and Whistler. The former gave the first great impulse to the art of etching in the seventeenth century, and the two latter have done similar service in the great revival of forty and fifty years ago. Rembrandt was the most versatile of all workers on copper. His needle dealt with every conceivable subject from grave to gay. He seemed equally at his ease in themes so widely various as a little sunny landscape or the gloom and tragedy of the Cross. Meryon's was a hard life of bitter disappointment and discouragement, and his work reflects in almost every line that strong and independent, if morbid, spirit which was the outcome of the fierce strife he waged against adversity during his whole life of forty-seven years till his warfare ended in the madhouse of Charenton. In technical and imaginative qualities his etchings of Old Paris

must remain the greatest works of their kind of the nineteenth century. Whistler for versatility is a second Rembrandt, though of a far lighter and gayer mood. His plates are remarkable for great delicacy and daintiness of touch, and the wharves and shipping of the Thames, no less than the canals and palaces of Venice, have found in him their greatest exponent. In conclusion, Mr. Cameron said the three great masters unite in their own work almost all the qualities of the other master etchers, and to know their work well is to know practically the whole art of etching so far as it has already gone.

A REPORT drawn up by the engineer, Mr. David James Ross, on the works executed by the Commissioners of Sewers during 1896, states that the total length of sewers constructed was 351ft., of which 101ft. were upon the lines of old sewers. A number of street improvements were carried out, and, as showing the importance of widening Cheapside, on the south side of the General Post Office, West, fronting Newgate Street, it is stated that on June 19th, 1896, 16,650 vehicles passed this point between 8 a.m. and 8 p.m., the width available being only 27ft. 7in. from kerb to kerb. With regard to subways it is stated that beneath the City streets, and under the control of the Commission, there exist at the present time about 2360 yards, or nearly one and a half miles, of subways. The lengths of gas, water, and hydraulic mains, and telegraphic, telephone, pneumatic tubes, and electric lighting conduits laid in these subways amount to a total of seven and a half miles. Access under proper supervision is given to the officers and workmen of the various companies, 4717 workmen and others being admitted during the year for various purposes. The usefulness of these subways is evidenced by the fact that in the streets beneath which they have been constructed no openings have been made for access to pipes, &c., except those for taking pipes into the ends of the subways, since they were constructed. The quantity of water used for washing the streets and courts was about 24,169,642 gallons. The quantity of refuse removed amounted to 73,284 loads, which is at the rate of 1409 per week, or about 235 per day during six days of the week.

At a conference of the Clergy and Artists' Association, which has as its object the improvement of Art in Churches, a paper on "The Obligation of the Artist to Ecclesiastical Tradition" was read by the Rev. Albert Baillie, who remarked that the true history of the divorce of Art from religion seemed to lie in the fact that the Church through her history gradually developed the subjective side of religion at the expense of the objective, and gradually diverted Art from its true function to serve in making an appeal to human emotions. In doing so she degraded and made it theatrical, and, consequently, material. Our most sumptuous modern Churches seemed to him as subjective—as little conscious of the true spirit of worship—as the barest of the last century Churches. It was not, then, to the tradition of the Church that they must look to guide Art, but to the spirit of true worship. He thought there was a tendency in modern Architecture to substitute a luxurious sumptuousness for the reverent beauty of antiquity. In Holy Trinity Church, Sloane Street, they saw an example of that enervating and luxurious beauty which appealed to the senses and not to the spirit. It was said by many that religious Art had nowadays no exponents, but he thought they could hardly blame Artists if they had failed to devote themselves to religious Art when the Church had given them no encouragement.—Mr. A. H. Skipworth (Consulting Architect to the Association) also read a paper, dealing with other aspects of the same subject.—A discussion followed, in the course of which the Bishop of Stepney said he longed for the time when it would be as much the work of genius to beautify Churches internally as it was now that of Architects to ornament them externally.

At the fourth annual dinner of the International Society of Wood Engravers held at the Holborn Restaurant, Mr. Seymour Lucas, in proposing "Prosperity to the Society," claimed that although they would have little difficulty in finding a better chairman than he was, he doubted very much whether they could find a man with a greater admiration for their beautiful Art. He had collected old wood cuts for many years, and it was one of his great recreations, when fatigued with painting, to take out one of his albums and con with delight the work of one of the old masters of their craft. For some years past he had heard that the Art of wood engraving was about to be annihilated, that the various modern inventions and process blocks had killed it, and that there was nothing left for them but to take to photography or the workhouse. He could not believe this dismal story. The beautiful and historic Art of wood engraving which had been in existence over 400 years, and numbered among its professors such names as Hans Holbein, Albert Dürer, and Burgkmair, was not to be wiped out by any invention. It must be patent to any thinking people that they could not get a machine to do what the hand could when directed by an Artist. They might just as well prefer the production of a barrel-organ to the sound creation of a master pianist. He was old enough to remember the great scare that arose when photography was yet young, and Artists everywhere said that it would utterly ruin and destroy miniature painting. Well, it had been a long time about it. They would only have to go to the Royal Academy Exhibition to find still some very beautiful specimens of that branch of Art. Photography had not killed the Art of miniature painting, neither would it kill theirs. While they did their work lovingly and with intelligence, they need fear no process or invention. Their public was a limited one, it was true; people of Artistic culture must necessarily be so limited, but it was the cultured few that led the masses, and true Art would live in spite of all invention. He could not conclude without mentioning how much both painters and they, their interpreters, owed to those who were at the head of their great illustrated newspapers, particularly those present, by whom they need never fear being overlooked. Mr. Wimperis proposed "Art and Literature," which was responded to by Mr. Marcus Stone, R.A.

On the western shore of Angel Island, in the harbour of San Francisco, about halfway between the steamer landing and the fog bell signal, is a most interesting natural curiosity. It is a tunnel that goes directly through an enormous cliff. When viewed from a short distance the tunnel appears to be only a small hole, but close examination reveals the fact that it is quite ten feet high and at least thirty feet long. At high tide it has a foot of water in it, and, were it not for the rocks close to the entrance, could be entered with a boat. When the tide is out the tunnel can be traversed from end to end on foot. As the centre of the tunnel is a little higher than the ends, it drains perfectly, so that it is dry except for a few puddles. The interior walls present a curious appearance. They are of volcanic rock, and look as if they were thrown into their present shape when mixed with some softer substance. This has been washed away, leaving the hole through the cliff. The rock formation is exceedingly hard, and in many places has a spongy appearance. It is almost black in colour, and very rough and jagged. For its full length the tunnel is about the same size, and is so straight it is hard to believe that it is not the work of human hands.

MR. T. H. THOMAS, of Cardiff, has designed a new medal for the Newport National Eisteddfod. In the centre is a head of King Arthur, helmeted as Pendragon, and with a wreath of oak leaves. On the band around are the twelve seats of the Round Table and Gorsedd in relief. In the depressed band is the "nod cyfrin" and decoration, composed of

the leek of Cymru, disposed as the ancient Celtic ornament of ribbon. Outside is a wide band, with an inscription in old Cymric lettering, "Eisteddfod Genedlaethol Freiniol, Casnewydd-ar-Wysg, 1897," in relief. On the bands crossing the borders are small panels, containing the motto of the chair of Caerlleon-ar-Wysg, "Nid da lle gellir gwell." The reverse is intended to be plain, except for a panel to contain the name of the receiver, engraved. The medal is thus formed so as to be used as a brooch for the Gorsedd robe by the recipient, a pin being attached at the back. The medal has been adopted by the executive committee.

MR. WILLIAM NIVEN, a member of the American Museum of Natural History, delivered a lecture the other day in New York, to the members of the American Geographical Society, upon his recent discovery of the prehistoric city of Omitlan, in Mexico, where he has been making excavations. This city lies about forty miles north-west of Chilpancingo, the capital of the State of Guerrero, and covers about twenty square miles of a wild mountainous region. Mr. Niven first learned of the existence of Omitlan from legends of the Mexican Indians. He secured the aid of the American Museum of Natural History and financial aid from a friend, and went to the locality of the half-buried city well equipped for Archaeological explorations. He was rewarded beyond expectations for his journey by discoveries of great importance which, when classified and arranged, he declares, will doubtless throw considerable new light on the history of pre-historic Mexico. Temples and houses, altars and idols were found in a partly ruined condition. Human bones were found in a compact layer twenty feet long and half a foot thick. The skulls were intact as they lay on the ground, but crumbled at the slightest touch. Among some of the most interesting relics discovered was a quantity of personal ornaments of beautiful workmanship. Beads, ornaments for the ears, masks, rings, amulets, jade, and mother-of-pearl were among some of the curios which the explorer's spade brought to light.

THE Society for the Preservation of Pictorial Records of Ancient Works of Art, which has from time to time presented a number of most interesting water-colour drawings to the Birmingham Corporation Art Gallery, has just forwarded, through Mr. S. C. Cockerell, two more drawings, which are now hung in the Long Gallery. The drawings are by T. M. Rooke, of the Royal Water-colour Society, and are faithful and beautiful renderings of the two subjects selected. The larger one of the two is a fine drawing of the west doorway of the Collegiate Church of St. Ours, at Loches, in Touraine. This little town is one of the most picturesque places to be found in the Loire district, and the Church of St. Ours is a very interesting monument of Gothic Architecture, standing quite alone in its singularity. It was begun by Geoffrey, Count of Anjou, in 962. To the west of the belfry tower is a low, square, vaulted porch, or narthex, of early Romanesque work, added in the twelfth century, out of which opens the very large and perfect Romanesque doorway, which Mr. Rooke has so faithfully reproduced. It is rich in mouldings and sculptural figures, and the general design is intended to represent the Divine Power seated, enthroned, and adorned above the arch of a strange world, the portal of the Holy Place. The second and smaller drawing is a copy of one of the stained-glass windows from the Cathedral of Notre Dame, Chartres. This Church, one of the most magnificent in Europe, has for one of its most striking features a perfect treasure of painted glass, not to be equalled in France. More than 160 windows are completely filled with it. Those of the nave and choir illustrate subjects from the Bible and legends of the saints; in their lower compartments are shown representations of the various trades of the city, the shoemakers, basket-makers, and so on, showing that various guilds and corporations were the donors.

## Professional Items.

ABERDEEN.—The Plans Committee of the Town Council has passed the plans of the following buildings:—Additions at No. 33, Albyn Place, for Mr. George Allan, per Messrs. Brown and Watt, Architects; four dwelling-houses on the west side of Marquis Road (Woodside), for Mr. James Green, per Messrs. Walker and Duncan, Architects; rebuilding of business premises on the west side of King Street, for Mr. E. M. Middleton, per Mr. Victor Mitchell, Architect; stable at No. 23, Short Loanings, for Mr. Alexander Thain, per Messrs. Brown and Watt, Architects; dwelling-house on the north side of Rubislaw Den South, for Mr. Alexander Cay, Forest Road, per Messrs. Brown and Watt, Architects; dwelling-house on the east side of Great Northern Road, for Mr. Nicholas Riley, per Mr. Duncan Hodge, Architect; dwelling-house and shop on the west side of Skene Square, for Mr. James Green, per Mr. William Ruxton, Architect; four dwelling-houses on the west side of Forest Avenue, for Mr. J. B. Davidson, per Messrs. Walker and Ross, builders. The Committee approved also of the plan of the proposed Episcopal Church on the north side of Victoria Road, Torry, per Messrs. Kinross and Tarbolton, Architects, Edinburgh.

ASHINGTON.—An important addition has just been made to the Church of the Holy Sepulchre at Ashington, in the shape of a north aisle, which has been completed at a cost of between £800 and £900. The original design, prepared by Mr. W. S. Hicks, of Newcastle, provides for a nave with north and south aisles, separated therefrom by two arcades of five pointed arches resting on octagonal piers with moulded bases and caps; chancel, porch, and tower. The estimated cost of the nave, chancel, and aisle now erected amounts to about £2500. The plans will be carried out in its entirety as the necessary funds are raised.

BRISTOL.—The Corporation of Wells are inviting tenders for the supply and erection of the plant required for the complete equipment of an electric light station with underground conductors. At Taunton, which has had electric lighting for some years, a scheme has now been suggested for providing an electric tramway from the railway station through the town as far as Silver Street. It is intended to apply in due course for the necessary statutory powers, and it is stated that should the initial line prove successful, extensions in various directions will be carried out.

The restoration and partial rebuilding of the Cotham Wesleyan Church in Redland Road, after destruction by fire, is now being commenced, so that the work may be completed and the Church reopened next October. The following tenders from the local firms have recently been received, viz.:—W. Cowlin and Son, £7245; C. A. Hayes, £6850; R. Wilkins and Sons, £6690; Stephens, Bastow, and Co., Limited, £6555; and G. Humphreys, £6426. Messrs. Stephens, Bastow and Co., Limited, having undertaken to complete the work in a much shorter period than either of the other competing firms, the trustees have placed the work in their hands. The enlargements will principally consist of the addition of an organ and choir chambers and a large church parlour, with an ante-room adjoining, all designed in complete harmony with the other new and the original portions of the buildings. The Architects appointed by the trustees are Mr. Robert Curwen, of London, and Mr. Herbert J. Jones, of Bristol.

EDINBURGH.—The Lord Provost's Committee of the Edinburgh Town Council has resolved to remit to a sub-committee to instruct the preparation of working plans for the corner blocks of buildings in North Bridge Street, and failing satisfactory offers being received from outside parties to undertake the work, estimates for the work being obtained meantime.

GLASGOW.—On Saturday afternoon the second spring visit of the Architecture and Building Construction Classes of the Technical College was paid to Mr. R. W. Forsyth's new warehouse in Renfield Street, by permission of Messrs. Barnet, Son and Campbell, Architects, to whom, including Mr. Douglas, the Clerk of the works, Professor Gourlay, suitably proposed a very hearty vote of thanks on behalf of the very large number of students present.

LEEDS.—Plans for the erection of the proposed Empire Theatre, two new arcades, and three or four blocks of new shops in Briggate, have been completed. The plans have been prepared by Mr. Frank Matcham, and when the projects are carried out, the appearance of a good part of the east side of Briggate will be materially improved. The plans show the area of ground to be covered by the new Empire Theatre as 1350 square yards, with a frontage of 28ft. to Briggate, two frontages of 8ft. and 12ft. 6in. to Fleet Street, another of 18ft. to Wood Street, and one of 8ft. to the rear arcade. The elevation to Briggate will be of Flemish design.

LIVERPOOL.—The public has now been permitted access to the jetty at the extreme end of the Prince's Stage, Liverpool. The jetty has been two years in course of construction, and is one of the most ingenious and substantial structures in the world for the landing of cattle. The jetty is approached by a capacious bridge leading from the Prince's Stage. The length of the whole landing-stage, inclusive of the Prince's and George's, is 2463ft., and the new jetty gives a further length of 400ft., the total length thus being 2863ft., or 223ft. over half a mile. The jetty is a permanent pile structure, and is connected with the main stage by a movable bridge.

NEWQUAY.—There is about to be erected at Newquay a large hotel, to be called the Headland Hotel, which will occupy a commanding site to the north-west of the Atlantic Hotel, and on the ocean side of the coastguard's lookout. A sketch and plans of the building show a building in the Renaissance style of Architecture. The entrance is on the south-eastern side, and from this a vestibule runs the whole width of the building, 120ft. From the left of the vestibule a staircase leads to the three floors above, while on the other side of the vestibule is a passenger lift. Against the south wall there is a large conservatory, approached by a corridor branching from the main vestibule, which is largely intended as a winter garden. The interior of the building will be light and cheerful by two large skylights above open areas on either side of the vestibule. The sanitary arrangements are designed on the most approved lines. Mr. S. Trevel is the Architect.

WALWORTH, S.E.—The vicar and churchwardens of St. Paul, Lorrinore Square, Walworth, have accepted the sketch-plans of Philip A. Robson, subject to some slight modifications, for new infants', girls', and manual training schools. The estimated cost is about £3250, and the building will accommodate 200 infants, 150 girls, and 86 in the cookery and carpentry centres; total, 436.

WHITWELL.—The Duke of Portland has laid the memorial stone of new voluntary schools which are at present in course of erection. The estimated cost of the new buildings is £4000. The schools are intended to accommodate 600 scholars. Gothic is the style of Architecture adopted, and the schools will be erected in red brick with Mansfield stone dressings, while the roofs will be covered with red tiles of the French pattern. Mr. Joseph Smith, of Hartshead, Sheffield, is the Architect, and Mr. J. Collingham, of Langwith, the contractor. The schools will be known as St. Lawrence's Public Elementary Schools.

A FREE Museum and Art Gallery is proposed at Plymouth in commemoration of the Record Reign.

## Trade and Craft.

### AN ARCHITECT AND HIS SPECIFICATIONS.

At the Ripon County Court, Mr. George Mallinson, of Harrogate, Architect and Surveyor, sued Mr. Abel Trees, of Ripon, contractor, for £30 5s. for quantities prepared in connection with a contract for work done at the almshouses of the Hospital of St. Mary Magdalene at Ripon. It was stated that in March, 1890, Architects were invited to compete for the erection of the St. Mary's almshouses at Ripon, and the plaintiff, among others, sent in plans, which were eventually accepted. At that time he was paid £55, which was 5 per cent. on the amount of the contract (£1100), and he was instructed to prepare quantities, which was accordingly done. Subsequently the plans of Mr. Scott, of London, were accepted, and when the plaintiff applied to defendant for payment of the account his solicitors (Messrs. Whitham and Hebden) repudiated the claim.—Mr. Middleton (for the plaintiff) said the contention was that as defendant had used plaintiff's specifications he was liable to pay for them.—The plaintiff stated that he had seen the specifications in defendant's hands.—Mr. Gowland, on behalf of the defendant, denied the allegation, and contended that he was not liable.—His Honour held that the defendant had used the specifications, and as the plaintiff had prepared them he was entitled to payment.—A verdict was given for the plaintiff, with costs.

### "JARRAHDALE" JARRAH.

The *Arabella* has arrived from Western Australia with 127 loads of "Jarrahdale" Jarrah aboard, to the order of McLean Bros. and Rigg, Limited, 1, Fenchurch-avenue, London.

### GREEN V. SYMONS.—IMPORTANT DECISION.

This was an appeal from the judgment of Mr. Justice Lawrence. The action was brought to recover damages for breach of warranty by the defendant in the letting of a house at Earlswood to the plaintiff. By an agreement in writing the plaintiff took the house from the defendant for three years, at a rent of £50 a year. The plaintiff's case was that the defendant verbally warranted that the house was dry and that the drains were perfect, and he was thereby induced to enter into the agreement. The plaintiff alleged that after he entered into possession he found that the house was not dry, and that the drains were not perfect, in consequence of which he and his family were compelled to give up residing there. There was no warranty in the written agreement. At the trial the following questions were put to the jury—(1) Was there a warranty? Answer.—Only a verbal warranty. (2) Was the house damp, and were the drains defective? Answer.—House damp, but the drains not defective. The jury assessed the damages at £50. The defendant applied for judgment on the ground that evidence of a verbal warranty was not admissible. The learned Judge, on further consideration, entered judgment for the plaintiff for £50. The defendant appealed, and further contended that there was no evidence of a warranty, but only of an innocent representation, and that to support an action for damages there must be a fraudulent misrepresentation.—The Court allowed the appeal, and the Master of the Rolls said that the Judge ought to have directed a verdict for the defendant. In his opinion, what the defendant said to the plaintiff as to the house being dry was a mere innocent representation which did not give rise to any cause of action. The plaintiff also relied upon a conversation that took place between his wife and the defendant when the plaintiff had signed the agreement and had given it to his wife to exchange for the counterpart signed by the defendant. There was no evidence, however, that the plaintiff's wife had any authority to do more than to hand over the agreement in exchange for the counterpart. There was no evidence, therefore, of a warranty, and judgment must be entered for the defendant, with costs here and below.

### ABERDEEN MASONS AND THE APPRENTICE QUESTION.

At a meeting of the monumental branch of the Aberdeen United Operative Masons and Granite Cutters' Union, a letter was read from the employers to the effect that they could not see their way to accede to the request of the men to have one apprentice to every two journeymen on an average per year, instead of an equal number of both classes as at present. After considerable discussion the matter was remitted to a committee to confer with the employers to see if some amicable arrangement could be arrived at. A communication, dated February 9th last, was submitted from the Cape Town masons, appealing to the members of the Aberdeen trade not to leave the city at present, as a strike was pending at the Cape. The letter stated that a meeting of the Cape Town stonecutters had been held on February 5th, at which it was unanimously decided to demand the increase of their pay from 11s. to 12s. per day, a working week of 48 hours, and better workshops, failing which concessions they would strike on February 22nd. The object in writing to Aberdeen is that Cape Town masters have signified their intention of sending to Aberdeen and other towns in the old country for operatives to take the place of the strikers.

### EXTENSIVE RAILWAY WORKS.

In the last six months the North British Railway Co. spent not less than £95,910 on the works at its Waverley Station at Edinburgh, and on the widening of the lines thereto. In the future, a further sum of £887,840 is to be spent on those costly works, the greatest that the North British Railway has in hand at present. There is, however, good progress being made alike with lines, station works, and hotels.

### A NEW TYNE BRIDGE.

A new steel bridge is to take the place of the Redheugh Bridge, which, for more than a quarter of a century, has connected Newcastle with Gateshead, spanning the River Tyne a quarter of a mile to the westward of the High Level Bridge. The outline is of American type, but the details are strictly in accordance with the best English practice. The bridge will be carried upon cylinder foundations, sunk to a depth of 50ft. below low water; and as far as possible the work will be carried on without erecting staging in the river. The preliminary preparations for the building of the bridge have already commenced. The lines are being marked out, and, at Glasgow, the contractors are busy with the preparation of the material. The actual work of construction will begin in a few weeks.

THE large and well-known Hotel Adler, at Grindelwald, has been destroyed by fire.

At Broadheath a Wesleyan school-chapel is to be erected at a cost of £2600. Sufficient land has already been secured.

It is stated that the Dean and Chapter of Peterborough have purchased an ancient farmhouse which is built of the same stone as the Cathedral, and which will be pulled down to use as required.

THE Princess Henry of Battenberg has promised to lay the foundation stone of a new block of buildings in connection with the Royal National Hospital for Consumption at Ventnor. The cost will be £2000.

THE council of St. Paul's Church, Wolverhampton, has decided to expend £600 in the renovation of the building and the repairing of the organ. The choir stalls are to be raised, part of the galleries cut away, and improvements made in the west-end porch.

MR. J. HOCH has recently completed the memorial clock for the Church of Molène, where lie many of those who perished in the "Drummond Castle" disaster. The competition for the manufacture of the clock was organised by Messrs. Donald Currie, and Mr. Hoch's design was selected. It will be placed in the tower of the little Church in the lonely island near Ushant.

## Surveying and Sanitary Notes.

MAJOR-GENERAL CROZIER, R.E., one of the Inspectors from the Local Government Board, has held an enquiry at Halifax relative to an application from the Corporation for sanction to borrow £32,000 for sewage purposes, also for sanction to borrow a sum of £25,000 for waterworks purposes, and for £364 for the provision of entrance-doors to the new markets.

THE Western Australian Government has just decided to spend a sum of £6,500,000 on carrying out various public improvements in the colony, and in connection with the scheme they have sent Mr. C. Y. O'Connor, their chief engineer, to England, with instructions to obtain expert advice in connection with the construction of extensive waterworks at Coolgardie, on which a sum of £2,500,000 is to be spent. Of this amount £1,500,000 will be spent on pipes, pumps, and other machinery, all of which will be purchased in this country, and it is anticipated that the tenders will be issued in a few weeks' time. Mr. O'Connor has also been instructed to obtain advice on the general management of railway workshops, the Government of Western Australia having decided to spend £200,000 on railway workshops. At Fremantle £100,000 is to be spent on dredging, and at Perth £200,000 will be expended in the direction of providing a dock at Fremantle, 600ft. long, 80ft. broad, and 33ft. deep. The machinery, &c., for these improvements will be bought in England.

THE Ashby Urban District Council having applied to the Local Government Board for sanction to borrow £15,117 for works of sewerage and sewage disposal, Colonel Ord Hasted, R.E., an inspector of the Local Government Board, held an inquiry, at which there was no opposition.

COLONEL JOHN ORD HASTED, R.E., Inspector of the Local Government Board, has held an inquiry at the Leeds Town Hall relative to the proposals of the Leeds Corporation to provide dwellings to accommodate a portion of the tenants who will be displaced by the carrying out of their scheme dealing with the York Street insanitary area. It was explained that the Local Government Board had sanctioned a scheme under a part of the Housing of the Working Classes Act, 1890, by which the Corporation proposed to deal with the property located in what was familiarly known as the York Street insanitary area. By the terms of the order the Corporation was required to provide housing accommodation for 2000 persons. The Corporation was proposing to deal with the area, which comprised a little over 16 acres, in four sections. Before, however, it could demolish any of the property it was required to provide houses sufficient to accommodate 500 persons. The question was, where should these dwellings be erected? After lengthy consideration of the matter it had been decided, with the Local Government Board's sanction, to erect two blocks of tenement dwellings within the area itself, and to provide for about 250 more of the displaced tenants by the erection of fifty small through houses upon the Ivy House Estate. This land adjoined the East-End Park, and was about a mile away from the area. Evidence was called in support of the Corporation's proposals.

THE final choice of the Gas Committee of the Huddersfield Corporation, from five selected candidates, for the post of gas engineer has fallen upon Mr. Edward A. Harman, resident engineer and superintendent of the gasworks at Swan Village, West Bromwich, belonging to the Birmingham Corporation. Mr. Harman tied with Mr. Alexander Allen, manager of the Neepsend Works of the Sheffield United Gaslight Company, each of them receiving ten votes. The Chairman of the committee (Ald. B. Stocks) gave his casting vote in favour of Mr. Harman. The salary attached to the post is £400 a year.

## SOCIETY MEETINGS.

**The Edinburgh Architectural Association.**—The Edinburgh Architectural Association recently visited the Parish Church and Calder House, Mid-Calder, under the leadership of Mr. A. Hunter Crawford. The Church at Mid-Calder is of early foundation, probably twelfth century; and the present building, which is of the sixteenth century, with modern additions, is curiously interesting from the fact that it was partly built under a bond between the Rev. Peter Sandilands, who, as an old man in 1541, wanted to ensure the completion of his work, and Sir James Sandilands, his nephew, who was to be paid 1600 marks in consideration of his executing the works all minutely detailed in the bond. Attention having been drawn to the Architectural features and the armorial devices, the party, after a thorough examination of the building, proceeded to Calder House. After Mr. Crawford had given an historical description of the house, which partly dates from the thirteenth century, and contains many very valuable paintings, the members were shown through the house by Lord Torphichen, who drew attention to various features of interest, and especially to the paintings in the drawing-room, formerly the large hall. St. Cuthbert's, East Calder, was also visited. This ruin is of twelfth century date, and the south wall and two gables are still partly standing.

**Devon and Exeter Architectural Society.**—Mr. Edgar M. Leest, the hon. secretary for Plymouth, Devonport, and Stonehouse Branch of the Devon and Exeter Architectural Society, lectured before the members on "Old Rochester" at the Plymouth School of Art, Princess Square, last Thursday evening. Rochester itself, its Cathedral, its quaint buildings, were Architecturally dealt with, and a lecture of much merit was further enhanced, particularly to those not versed in quantities and measurements by lantern views.

WE are requested to notify that on March 25th Mr. H. O. Cresswell will remove his offices from 30, Craven Street, Strand, W.C., to 17, Buckingham Street, Adelphi, W.C.

WE have received from Mr. B. T. Batsford, of High Holborn, a copy of a book on "Plastering," plain and decorative, which appears to be a very exhaustive treatise on the Art and Craft of plastering and modelling. Our review upon this work will appear very shortly.

A CERTAIN M. Maigrot has discovered an old Roman well in his garden at Grand. He has already found in it sixty-two coins of the reigns of Agrippa, Nero, Trajan, Adrian, Antonius, Marcus Aurelius, Diocletian, Domitian, and Constantine, all in perfect preservation.

THE principle of the tubular boiler has been discovered in the ruins of Pompeii, where a number of domestic bronze boilers have been found with tubes inside, as in our most elaborate marine boilers. The tubes are made of bronze foil, bent and brazed or soldered. Some of them are elegant in form. They are illustrated in the proceedings of the American Society of Mechanical Engineers.

## TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

**ANDOVER (Hants).**—For alterations, &c., to town hall, for the Town Council. Mr. Alfred Purkess, Borough Surveyor, Town Hall, Andover.  
Annet and Son... £245 0  
Frank Beale... 215 0  
Hy. Cook... 197 0

**ASHTON-UNDER-LYNE.**—For the erection of the Waterloo and Taunton Liberal Club. J. H. Burton, Architect, 2, Guide-lane, Hooley Hill.  
Tenders for all Trades except Plumbing and Glazing.

J. W. Williamson, Ashton-under-Lyne... £953 15  
Thos. Dean, do... 946 0  
Edwin Marshall, do... 936 10  
C. Keswick, do... 917 15  
Gittone Bownes, do... 915 0  
E. Kirby, do... 893 10  
John Robinson, do... 885 15  
Jabez Gibson and Son, Dukinfield (accepted)... 870 0  
Plumbing and Glazing.  
G. H. Coop, Ashton-under-Lyne... £48 10  
G. Burrows and Co., do... 48 0  
Alfred Heald, do... 47 10  
Peter Willis, do... 45 0  
H. C. Hobson, do... (accepted) 40 18

**BANGOR (Wales).**—For additions, &c., to Nos. 322, 324, 326, and 328, High-street, for Mr. J. E. Roberts, J.P. Mr. R. Glynn Davies, Architect, 220, High-street, Bangor.  
Evan Williams... £1,000 0  
Jones and Williams... 593 0  
Wm. Parry, jun., 880 0  
R. and J. Williams... 853 0

**BRISTOL.**—For restoring, partially rebuilding, and making alterations and additions to Cotham Wesleyan Church, Redland-road, Bristol. Messrs. Robert Curwen, London, and Herbert J. Jones, Bristol, Architects.  
Time (Weeks).  
Cowlin and Sons... 36  
C. A. Hayes... 52  
Wilkins and Sons... 52  
Stephens, Bastow and Co., Ltd.\* 39  
G. Humphreys... 48

**BRISTOL.**—For alterations and additions to 18, Old Market-street, for Mr. R. Bromhead. Mr. Walter Andrew, Architect, Parkstone.  
J. Perkins... £496  
W. Cowlin and Son... 483  
Hughes and Weeks... 465  
Wm. Church... 447

**BRANKSOME (Dorset).**—Accepted for erection of three shops on the Upper Bourne Estate, Branksome, for Mr. A. T. Frampton. Mr. Walter Andrew, Architect, Parkstone.  
H. W. Lovell... £1,500

**BRYNMAWR (Breconshire).**—For the erection of a parish church. Messrs. Nicholson and Hartree, Architects, Hereford.  
For nave. For whole church.  
H. Smith... £2,871 12 6  
J. Morgan... 2,238 16 0  
J. Jenkins... 2,753 0 0  
Thomas and Sons... 3,290 0 0  
J. Jenkins, Brynmawr... 2,238 0 0

**BURGESS HILL (Sussex).**—For the execution of sewerage works, Ferndale-road, for the Urban District Council. W. H. Holman & Co. £230 0 William Oram, Herbert A. Chambers 213 12 Burgess Hill\*... £199 15

**BURNLEY.**—Accepted for the erection of a hospital for infectious diseases, Ribblesdale, Burnley, for the Burnley Joint Hospital Board. Mr. F. S. Bulton Architect, Blamley-street, Burnley. Quantities by Architect.  
Masonry, Bricklaying, &c.—A. Robinson, jun., Nelson... £7,219 0 0

# Building Trades Exhibition SUPPLEMENT.

MARCH 24TH, 1897.

## THE BUILDING TRADES EXHIBITION.

ON Saturday the annual Building Trades Exhibition was opened at the Royal Agricultural Hall, Islington, by the Lord Mayor, accompanied by the Sheriffs and Professor J. Banister Fletcher, Mr. H. Greville Montgomery, Sir A. Blomfield, Mr. Charles Barry, Mr. Frampton, Major Isaacs, Mr. Richman, Major Leslie, Mr. Boys, Mr. L. Angell, and Mr. W. Matthews.—Professor Banister Fletcher, in moving a vote of thanks to the Lord Mayor, explained the origin and present positions of the handicraft competitions that are to take place during the Exhibition. They were started as an experiment five years ago, when the Building Trades Exhibitions had got to about as low a level as they well could be. It was thought that open competition, free to all, would stimulate men to better work, and must be of advantage to those not so advanced in practical work, who would have the opportunity of watching day by day the work done. Both classes would be able during their resting-time to see the best material, appliances, and inventions connected with their trade, and the works of Art that were lent by the Science and Art Department, the Corporation of the City of London, the City Companies, and others. This year the number of competitors more than doubled those of last year, while last year's total more than doubled its predecessor. As there was every prospect of the number continuing to increase now that the competitions were well known and had proved a success, voluntary help would be required to enable this valuable and growing work to be continued.—A vote of thanks having been seconded by Sir Arthur Blomfield, the Lord Mayor said that inasmuch as some years had passed—some said thousands, and some millions—since we abandoned the habit of living in tents and took to living in houses, it was most desirable that we should have fit, proper, and commodious houses to live in, and above all, that the sanitary arrangements should be complete. There was very little doubt that the decrease in the mortality of the human race was nearly as much attributable to the advance in our sanitary regulations, and the manner in which they were carried out, as to the enormous strides that science had made not only in therapeutics, but in surgery and the whole art of healing. It was a curious thing that, whereas all science and invention were the mere reproduction of things, and had been done either by the Egyptians, the Greeks, or the Romans, we in England had, perhaps, invented a more remarkable structure than any known in ancient history. He alluded to the Crystal Palace. When it was first determined to hold the Great Exhibition in England, a great discussion arose as to how it should be housed, and Mr. Joseph Paxton

submitted a design of glass and iron, which was not only a thoroughly original idea, but which, having been successfully carried out, remained a monument to the imaginative genius of the building trade of England, and of the admirable manner in which an invention could be carried out. The more they could foster such institutions as this, the more they would help to beautify this City of which they were so proud, and to make their homes sanitary, comfortable, and free from draughts—a consummation devoutly to be wished for. Mr. Blashill having proposed, and Mr. Angell having seconded a vote of thanks to the Sheriffs, the ceremony concluded by the Lord Mayor declaring the Exhibition open, after which the civic party made a tour of the exhibits, many of which were minutely examined by the visitors. With regard to the Exhibition itself, it may at once be stated that it is the best of the kind ever held in London, the excellence of the present display amply demonstrating the soundness of the decision of the promoters in permitting a year to elapse between each display, the result being that the ground floor is occupied by many leading firms in various branches of the trade, many of whose stands are really very Artistic conceptions, some of the most pleasing effects having been obtained from such unpromising materials as stone. Another cause for congratulation is the fact that all extraneous and foreign matters to the trades represented have been rigorously excluded, the result being that the display in fact, as well as in name, constitutes a technical exhibition, and not a fancy bazaar, as too many of these have proved in the past. Everything that goes to the building and construction of houses is to be found here, including concrete for the foundations, stone and brick for the walls, tiles for the roofs, decorations for the interiors, stoves and ranges of all kinds, together with various heating and ventilating arrangements and apparatus, and all the latest inventions in fireproof floorings, house draining and trapping, fibrous and fireproof plastering, wall decorating, door fastenings, cisterns, window frames and sashes, lifts, pavements and floor coverings of various descriptions, locks, glass and other decorations, glazing, lighting, roofing, joinery, tiling, and sanitary works, the result being a very comprehensive and thoroughly representative whole. As the different exhibits are specially dealt with in another column, we refrain from touching on them here, though we cannot resist mentioning the very pleasing and artistic manner in which the stands of the N.A.P. Window Company; Messrs. Ewart and Son, who showed several fine specimens of copper work, including a figure of Industry and some artistic Renaissance copper tiles; the "Emdeca" Decoration Company; the Incandescent Gaslight Company; Messrs. J. Mitchell and Co.; the Expanded Metal Company; Aspinall's Enamel, who had a model villa furnished with articles decorated with their specialty; Messrs. Bratt, Colbran, and Co., with a varied assortment of

stoves, tiles, and wrought metal work; Messrs. Candy and Co., with glazed and vitrified bricks; Messrs. Diespeken and Co., with some very choice marble mosaic work; the United Asbestos Company, with their Salamander decorations; the Pilkington Tile and Pottery Company; Mr. H. Herrmann, with a varied assortment of carved woodwork; Messrs. Sutton and Co., with silicated stoneware pipes; and the Barton Limestone Company were arranged, this stall being very effective and pleasing, while many of the exhibitors added to the general attractiveness by the free employment of foliage and flowering plants. Messrs. Stanley Bros., of Nuneaton also deserve a special mention for their exhibit. In the galleries wherein the educational work will be carried on during the time the Exhibition is open by the Craftsmanship competitions in masonry, painting, joinery, stone carving, carpentry, brickworking, wheelwrighting, plumbing, smithing, and wood carving—and the awards in which will be presented on Saturday next by Sir Arthur Arnold, promoted by the Trades' Training School—will be found some very interesting exhibits, including some choice old wood and stone carvings from the South Kensington Museum, drawings and models of the Tower Bridge from the City Corporation, and a cabinet designed by Mr. J. P. Seddon, which in its decoration illustrates the honeymoon of King Reece, and has panels painted by Dante Gabriel Rossetti, Ford Madox Brown, and Sir Edward Burne-Jones, the work being one of the gems of the exhibit. We are betraying no secret, we believe, when we mention that, with the walnut wood and mosaic overmantel in the adjoining bay, it will form a wedding gift to Mr. Seddon's daughter, and happy must the lady be in their possession. The exhibit of the Della Robbia Pottery Company should also be visited, and with this mention our general remarks upon what is a most interesting Exhibition must close. Altogether Mr. H. Greville Montgomery is to be heartily congratulated upon his present success, and on his prospective wisdom in not holding another similar Exhibition till 1899.

### THE ALBION CLAY COMPANY.

THE most central stand in the commodious Hall is occupied by the Albion Clay Company. That the usual high standard of their display is maintained, a look at Stand 88 will quickly prove. It is carefully set out, and the most striking feature is a system of drainage which the company have laid down showing the application of Sykes' patents. A description of this system will be read with interest. Commencing at the outfall we have Sykes' interceptor which hermetically seals the chamber whilst by means of the screw plugged access-eyes a ready access to the respective drains is obtained. At the same time, it prevents flooding of the chambers, and in case of a stoppage in the system it is quickly detected at the back of the house. This interceptor

will doubtless be well known to many of our readers. It is used very extensively throughout the United Kingdom and abroad—as a matter of fact the patent is at present doing duty at the Cape, in India, in China, and other foreign parts—and there can be no doubt that it discharges its functions very effectively. Connected with this interceptor, in the system under consideration, are Sykes' patent joint pipes, which consist of a male and female thread screwed home, and compressing a composite medium, which will admit of the pipes being laid in or under water. The insertion of junctions in this joint has puzzled many practical men, but the application is clearly illustrated at the exhibition, and it appears to us to be almost as simple as the laying of the pipes themselves. We now came to a junction at the chamber, which is also hermetically sealed by means of Sykes' improved inspection pipes. The next chamber contains a set of Jones and Sykes' patent channel bends, which are designed to prevent the splashing that occurs in all chambers. The extension of the system shows the application of Sykes' inspection block and disconnecting slipper (which, by the bye, the Albion Clay Co. are introducing into Park Hospital, which is under the control of the Metropolitan Asylums Board), and also gullies fitted with Sykes' patent screw-stopper access-eye. The system is completed by the application of a soil pipe shoe, which has an inspection hole fitted with a screw stopper, and a substantial foot to support it and take the weight of a soil pipe. Stoppages frequently occur at the foot of soil pipes through domestic articles lodging at the knuckle bend, and it is in such a case that this system has the advantage over others, in that the blockage is readily released by merely taking up the screw stopper, thus avoiding a breakage of the pipe or a disturbance of the surface of the ground. The system is undoubtedly interesting, and possesses many advantages over other systems we have recently inspected. Coming to the other exhibits of the Albion Clay Company, the well known patent "Paragon" pipes are to the fore. These pipes have their sockets made eccentric instead of concentric, as with ordinary pipes, and the effect of this is to give them a true alignment with the inverts. As every builder knows, ledges are commonly caused in ordinary pipes by the weight of the earthenware forcing out the cement, but in the case of the "Paragon" pipe this is obviated. On inspecting the pipes on view, we found the invert presented a true and even surface throughout. Sykes' patent street gully, which is also well represented, is designed to arrest road detritus—and no gully serves its purpose unless it does accomplish this end. The patent possesses a deep water seal, which, the Company maintain, will stand the hottest weather without becoming evaporated. The outlet to the sewer is well below the surface of the road, where it cannot be affected by steam rollers and heavy traffic, and in addition to this there is a ready access in case of stoppage. These gullies, we are told, have been used extensively by corporations and urban district councils throughout the United Kingdom. Among other specialities which the Albion Clay Company has on exhibition, are Sankey's gully and Keith's flushing trap, and, lastly, a word might deservedly be said respecting the excellence of their stoneware. The Company's "Granitic" stoneware is too well-known to require lengthy notice. It is sufficient to say the body presents a dense and impervious section. One exhibit is conspicuous among the rest. It is a broken pipe—12in. Sykes' patent—with a tale to tell. It was laid in the Stafford main drainage under most difficult conditions, and in some of the worst water-logged ground, viz., running sand and water, and on inspecting the pipe we find the joint was splendidly made—a fact all the more satisfactory because the pipe has not been jointed for exhibition purposes.

#### N.A.P. WINDOW COMPANY, LIMITED.

It is an acknowledged characteristic of the N.A.P. Window Company, Limited, 159, Victoria Street, Westminster, S.W., that everything which this firm takes in hand is

thoroughly well done. The space allotted to them is in the centre of the hall, and the exhibits displayed (many of which are of a comparatively recent date) are one and all distinguished by novelty and undoubted utility. Every speciality is shown full size; indeed it was said that the example of the N.A.P. Asylum Window, which forms a most prominent feature of the general exhibit, is large enough to light anew the darkest mind ever shut up in a padded room. A detailed examination of each exhibit is recommended. The steel in and out opening casements embrace a variety of inventions which have been perfected with great care during the past few years at considerable cost. Every method is guaranteed to be perfectly water-tight in any situation. As the novel parts of each casement form the subject-matter of separate Royal Letters Patent, almost any desired combination of the patented parts is possible. The company is thereby enabled to comply with the special wishes of Architects upon matters of detail. All movable parts are of gunmetal. All non-movable parts are of rolled steel of a high grade, possessing great strength and rigidity. Consequently the casements are much lighter in appearance than if they were of iron. The advantages claimed for these casements are the following:—They open for ventilation in the same way as ordinary casements, and each is secured while open or shut by the usual casement-stay and fastener. When it is desired to clean the outside it is only necessary, before swinging the casement inwards, to lower the sill water-bar in the case of the "slip patent." With respect to each of the other methods, the operations necessary prior to opening the casements inwards are equally simple. Repainting or reglazing can be conveniently done from within, and the injury which the use of ladders (carelessly handled) does to the sills and window masonry generally is thereby obviated. The absence of risk to life or limb attending the cleaning or repair of the casements, enables owners and occupiers to avoid all the moral and legal liabilities generally connected with every "window-cleaning accident."

#### MESSRS. STANLEY BROTHERS.

STAND 99 can scarcely pass unnoticed. It comprises a very striking erection built in different coloured glazed bricks, relieved by red terra-cotta decorations, and glazed Grecian caps and string courses in glazed and red. Messrs. Stanley Brothers have shown great enterprise at the present exhibition, and the cost must be appreciable. The most striking feature of the building is their Diamond Jubilee panel, which we have previously noticed in our columns, and a lion head fountain in red terra-cotta. Both are exquisite pieces of work; and it is not difficult to believe that the Jubilee panel is meeting with general approval. A special feature is made of different coloured brown glazes, string course bricks and roofing tiles in red and white glazed. The white glazed is distinctly new. It can be used to advantage in covering old walls where light is required. It recommends itself on economic grounds, and is generally admitted to be more durable than other materials used for the same purpose. Surmounting the roof are a number of red terra-cotta chimney-pots in very deep colour, and with red ridges and finials of a very grotesque nature. On the stand adjoining are shown the various manufactures of the firm, which includes cane-glazed sinks, blue Staffordshire goods, blue ridges, quarries in red, blue, and buff, 4in. and 6in. semi-encaustic tiles in red, buff, and chocolate. These tiles have been largely introduced in the erection of churches, conservatories, &c., being better than encaustic tiles and quite as economical.

#### BLACKMAN VENTILATING COMPANY, LIMITED.

At Stand 165, the Blackman Ventilating Company, Limited, exhibits some ventilation appliances which are well worth close inspection. Foremost, is the Blackman Fan, which, combined with a steam air-warmer fitted with a bye-pass for cold air, serves in the treble capacity of ventilating, heating, and drying,

and although its powers are thus divided, it has been found very efficient, and has met with considerable approval. Another Blackman Fan, carried out on the same principle, and having a diameter of 48in., unites ventilating with drying, and is also very effective in removing dust, steam, fumes, &c. The Electric Blackman Fans, which are solely for ventilating, are also on exhibition. They are driven by electric current and are specially suitable for ventilating offices, restaurants, or very large rooms generally. The Electric Blackman Fans at present do duty at the Houses of Parliament, in the Hotel Cecil, on Royal Yachts, &c., having withstood the test of time successfully.

#### THE ANAGLYPTA COMPANY, LIMITED.

The Anaglypta Company is showing its well-known decoration on Stand 44. Anaglypta is a comparatively recent production, and has met with a warm reception by decorators, because it gives them the opportunity of producing decorated surfaces bearing the imprint of their own thought and skill. A variety of original effects may be produced by the addition of a few artistic touches to simple scrambled treatment, and a decorator can, therefore, produce many new decorative schemes based on one given decoration. The Anaglypta Company has, perhaps, never illustrated the decorative wealth, the capability of innumerable beautiful colour effects of Anaglypta as in the present Exhibition. Two striking ceilings in high relief are shown with equally attractive dados, fillings, cornices, friezes, &c. One of the company's latest friezes is of a grape pattern in very bold relief, which we are told is the first of its kind that has ever been executed. A dado shown makes a very realistic imitation of wood carving, and treated in dark oak colour has a very fine effect. Anaglypta will doubtless continue to increase in popularity, and the knowledge of decorative effects displayed by the company—or its Artists—no one, we think, will dispute. The decorations are not only beautiful; they are sanitary, and, though made of paper pulp, are very durable.

#### PILKINGTON'S TILE AND POTTERY CO., LIMITED.

This Company, of Manchester, London, and Paris, has on exhibition a great variety of glazed tiles for walling purposes and general use. Several of the examples are distinct specialities, and all are of pretty design. Some of the patterns are by such men as Lewis F. Day and C.F.A. Voysey. The tile first calling for notice is what is called the Cloissonné tile (No. 19). It is quite a new invention in its application to tiles and its object is to prevent the flowing of the various glazes of a design. The effect is obtained by means of a raised line. In another pattern this is reversed. The same effect is obtained by an incised line, and in both cases the result is very pleasing. Very low relief is obtained in another panel of the Pilkington Tile and Pottery Company's show, which will, doubtless, appeal to those who do not care for embossed decorations. Still a further panel shows tiles decorated in colours with a thin transparent colour glazed over, and which produces a soft and pleasing effect. Dados in rich brown, in blueish gray, and in warm madder brown are shown on the stand, the greater number of the tiles being arranged merely for exhibition, without any regard as to definite positions for decorations. The same exhibitors have also on show examples of plain flooring. Their quartzite is specially hard, whilst it also combines the advantage of cheapness. It is made in about half-a-dozen colours.

#### MESSRS. SHANKS AND COMPANY.

MESSRS. SHANKS AND COMPANY, of 46, Cannon Street, E.C., occupy a commodious stand immediately near the public entrance and utilise nearly the whole of the space by an interesting exhibition of their improved baths and patented closets. These include their patent lever syphon closet (which embraces patent Dicksee arrangement for slops), their patent Barrhead syphon closet, their improved

washdown closet, with greatly increased water area, and a similar closet with lead trap, together with their patent *fin de siècle* and other modern baths with accessible waste. Their lavatories are particularly noticeable, and are up-to-date in every respect. Several are fitted on frieze brackets, and, both from considerations of utility and appearance, are to be well recommended. There is a finish about all Messrs. Shanks and Company's goods which the practical observer—or even the casual observer—cannot fail to notice.

#### MESSRS. F. McNEIL AND CO.

MESSRS. McNEIL AND CO., of Lambs Buildings, Bunhill Row, E.C., are not lacking in enterprise. Their patent felts are much *en evidence*. These felts are for roofing under slating tiles and metal, and for lining corrugated iron buildings. For deadening sound it has been proved that they act admirably; whilst they have been found equally satisfactory when used for lining damp walls, for covering cisterns, or for covering hot water pipes and boilers to prevent loss of heat. The Company's patent "Silicate Cotton" or "Slag Wool" is a very essential part of Messrs. McNeil's exhibits. It is shown in various forms for use in building construction and rests its claim for patronage upon its non-conducting, fire-proof and sound-proof qualities. Again on

admirably to decorative treatment—a fact which the Company's stand amply proves. It contains numerous very fine examples, but first of all, a word as to the material may be of interest. Asbestos is a mineral fibre, and is obtained from the Company's own mines in Italy. Its fire-resisting qualities are well known, and are resulting in the "Salamander" decorations being very extensively used in modern works throughout the kingdom. The asbestos after being subjected to special treatment, retains the hard firm impression made upon its surface by the process of embossing, whether in high or low relief, so that the character of the design is not impaired. Another point worthy of note is the plaster-like effect of the decorations. This is amply illustrated in the present exhibition, where there are four ceiling panels and several friezes—scrolls, floral, and swag—which are almost indistinguishable from plaster mouldings which represent a cost almost treble that of "Salamander." "Salamander" is more easily hung than other embossed decorations, and we believe it is especially suitable in cases where it is required to combine effective and sanitary decoration with additional security from fire. The designs on exhibition have been drawn by well-known Artists, and there is a commendable excellence about all. The ceilings, as indi-

#### MESSRS. J. KAYE AND SONS.

MESSRS. J. KAYE AND SONS, of 93, High Holborn, are demonstrating on Stand 52 the superior utility of their patent locks, bolts, latches, and handles. They are the makers of patent bolts, &c., for every kind of door, desk, drawer, window, cupboard, &c., and some of these contrivances show an aptly applied ingenuity which has produced the most satisfactory results. Messrs. Kaye do not make an imposing display; they merely seek to put their wares to the test, and prove their superiority as special contrivances for special purposes. The goods on show are made for railway carriage doors, brougham and other carriage doors, house doors, school doors, prison doors, and many other doors, not to speak of the doors for which Messrs. Kaye's engaged bolts and automatic bolts are specially adapted.

#### MESSRS. CHARTERIS AND LONGLEY.

MESSRS. CHARTERIS AND LONGLEY do not make a very pretentious show. Their stand, numbered 112 E, is interesting none the less. The nature of their goods—wood block flooring—does not permit of grandiloquent display, but in arranging their stand they have not only given an example of the flooring as it is laid upon its concrete basis, but they have neatly incorporated, in the construction of their

SPECIMEN OF "SALAMANDER" DECORATION BY THE UNITED ASBESTOS CO.

the same stand we find the Fibrous Asphalte damp course on foundation felt. It is effectual in preventing damp rising—a fact which we believe is not in dispute. It overcomes the difficulty encountered in the use of slates and pitch and asphalte, viz., the liability to crack. Patent pipe coverings and glues of all kinds are also included among Messrs. McNeil's exhibits.

#### MESSRS. WALTON AND COMPANY, LIMITED.

LINCROSTA-WALTON, or the Sunbury wall decoration, is being exhibited on Stand 69, along with the "Lincrosta-Walton" table mats. A wide range of patterns are displayed, among the newest being a tile dado, by Lewis F. Day, the "Saracen" dado, and a delicate suite in "Empire" style, consisting of ceiling, frieze, filling, and dado, which fully illustrate the beauty and utility of Lincrosta-Walton as a wall and ceiling covering. The table mats have been pronounced as embodying the three greatest essentials—non-conductive quality, freedom from liability to damage under ordinary wear and tear, and possessing an attractive shape and design. The mats are made of Lincrosta-Walton, which is specially adapted to this kind of work.

#### THE UNITED ASBESTOS CO., LIMITED.

The United Asbestos Company, Limited, has made a very pretty display of the "Salamander" decorations. Apart from other considerations altogether, asbestos lends itself

cated, are very plaster-like in effect, two of the panels being in very bold relief, and particularly striking as imitative of plaster work. The fittings include designs in the style of the Italian Renaissance, Old English, Louis XV., Francis I., Oriental, &c., whilst underneath are dados equally representative in style and colour of design. One pattern is worth mentioning as bearing a striking resemblance to wood-carving. The effect was a little heavy, however.

#### MESSRS W. GIBBS AND SONS.

THE Art of glass decoration has worthy exponents in Messrs Gibbs and Sons of Charlotte Street, Blackfriars Road, S.E. They occupy Stand 53, and show work suitable for nearly all needs—for public-houses, hotels, restaurants, and public buildings in general, together with domestic work, and work for churches, &c. The feature of the stand is an embossed decoration embracing Gibbs patent amber staining. A prettier design is not frequently met with. It is a combination of white and gold, and most certainly is a beautiful form of glass decoration. There is much variety of design and also style of decoration; some back painted mirrors being worthy of close inspection. The work has been very finely executed, and its object is, of course, to preclude colours being injured or washed off, and also to avoid a reflection of the design, which are the great disadvantages of mirrors painted on the outer surface. Messrs Gibbs make a speciality of advertising tablets.

pavilion, specimen pieces of the various woods—pitch pine, deal, oak, walnut, and teak—used in the manufacture of the wood blocks. Messrs. Charteris and Longley's floor is commonly known as the Patent Perfected System. The full-sized models on the stand show how well a special grooving provides a perfect key, in addition to forming a rebate for securing the tongue, which is a special feature of the system, in that each block is complete in itself without any auxiliary means of security, such as loose dowels, tongues, or discs, which are so liable to be left out by careless workmen. A good article will come to the front sooner or later, and by sheer merit alone the "Patent Perfected System" has, in spite of its price, won many patrons amongst prominent Architects. Such names as Messrs. Waterhouse and Sons, the late Ewan Christian, Sir Arthur Blomfield, Mr. Aston Webb, &c., figure in a long list, a fact which, in itself, is eloquent testimony of efficiency. The blocks are all prepared at the firm's own workshops, at either Peckham or Crawley, by an ingenious machine, which not only cuts off the blocks to lengths, but forms a special dove-tail tongue at each end, so as to ensure greater accuracy. The material is also specially dried by the well-known Shapland process, which obviates discolouring the wood or the destruction of the fibre. During the last eighteen months, we may mention, the system has been largely adopted in America, and at the present time the firm has in hand contracts in all parts of England.

### THE EXPANDED METAL COMPANY, LIMITED.

THE variety of the applications of expanded metal for building purposes is almost limitless. Further examples of it are shown on the Company's stand—special position No. 3. The expanded steel lathing has been generally accepted as one of the best metallic lathings now on the market. It requires just sufficient mortar to ensure fireproof capacity, for when embedded in the mortar it becomes beyond the reach of fire. Herein lies an important advantage, for a lathing which does not admit of this cannot be absolutely fireproof. The Company also exhibits examples of fencing, tree guards, and all kinds of ironwork for use in horticultural connections. A novelty on the stand is expanded brass. The Company has just made the innovation, and it bids fair to remain. The "expansion" is chiefly made in the construction of fenders, fire grates, letter baskets, &c., with results which compare very favourably with other expanded metals. Expanded metal suspended ceilings are also shown, and among other exhibits may be mentioned concrete and channel iron arched floors, encasing for girders and columns, and other goods in copper and aluminium for various purposes.

### G. WRAGGE, LONDON AND MANCHESTER

THE Metal Company's neighbour, Mr. G. Wragge, of London and Manchester, makes a similar display of ironware. The feature of his stand is a baldachino, which is to surmount the altar of a Catholic Church at Burnley. This baldachino is specially interesting, as it is made solely of hammered wrought iron, and in design is very neat. Mr. Wragge also shows a pair of gates, made for the Leeds branch of the National and Provincial Bank; and a novelty is to be seen in the way of sign lettering. The pattern is worked out in wrought iron with polished copper letters with pleasing effect. Some goods in gun metal will also attract the attention of interested visitors.

### MESSRS. CANDY AND COMPANY, LIMITED.

MESSRS. CANDY AND COMPANY, of 11, Queen Victoria-street, E.C., occupy a central stand, and make a rather large show of their white and coloured glazed bricks and sanitary materials. Coming within this latter category are stoneware pipes, traps, sewer gas excluders, &c., whilst among the numerous kinds of glazed bricks, are included their buff vitrified Olympia stable bricks without cross grooves, their buff vitrified engineering and facing bricks, their Silica fire bricks as used in the Government Dockyards, their buff vitreous stable bricks as used by the War Department for cavalry stables, &c. Examples of buff Architectural terra-cotta are also shown, and are not only artistic but have been executed in very good style.

### THE ENAMELLED METAL DECORATION COMPANY.

THE Enamelled Metal Decoration Company of 97, Queen Victoria Street, E.C., has erected a small building of their enamelled flexible metal known as "Emdeca." It is a new secret process—it has been on the market about a year—and as a wall and ceiling decoration is claimed to be permanent, and a friend of sanitation. It seems to us to be, at any rate, a worthy substitute for tiles, lending itself to very decorative, though not essentially artistic, treatment. "Emdeca" is easily fixed, and being flexible can be put upon any smooth surface, be it flat or circular, without damaging the enamel. "Emdeca" is of that host of decorative materials employed to make every part of the Trocadero Restaurant beautiful, whilst it has also been introduced into the Westminster Palace and other hotels and public buildings. The Enamelled Decoration Company, also shows some lovely panels of hand-painted marble.

### ASPINAL'S ENAMEL, LIMITED.

ASPINAL'S have a pretty villa furnished with furniture decorated with enamel and distemper Wapicti. The effect is very pleasing.

### THE GRANITE SILICON PLASTER COMPANY.

"A MUCH-NEEDED substitute for the common lime and hair plaster," we are told, is granite plaster. And we are inclined to agree. Granite plaster is an artificial stone composition for use in the interior of buildings, and for covering ceilings, walls, &c. It is applied to lath work, brick, stone, or other building material in the usual way, and is very easy and plastic to use. It dries quickly and hardens to such a degree as to well deserve its name of "granite" plaster. How quickly it dries and hardens is illustrated at the Exhibition, where a small structure was put up, and became quite fit for any use within three days. In fact, within twenty-four hours of application "granite" plaster is hard and dense, and will bear rough treatment without denting, chipping, cracking, or loosening. The frequent objection to common lime and hair plaster on the ground of insufficient adhesiveness, certainly cannot be brought against "Granite" plaster. And it is in this respect that it has foremost claim for use in ceiling work, except, of course, in cases where expense is not a very pressing consideration. Then it would obviously be better to use cements of various makes. Granite plaster has also to compete with the different sorts of wood which have come into use for interiors; but here again the special plaster has the advantage, not only on the score of cost, but on account of its incombustible nature. Its tenacity and adhesive power is well exemplified at Stand 43, where the granite has been placed on different surfaces: on one side it is on expanded metal lathing, on another finial metal lathing, and on a third, on ordinary sawn laths, whilst on a partition made of expanded metal the plaster is shown as applied to both sides. The results are most satisfactory, and without a doubt granite plaster has a great future.

### J. P. WHITE, BEDFORD.

ONE result of the Exhibition is to show a tendency towards the displacement of wood chimney-pieces by chimney-pieces made of iron, but however that may be, the fact remains that Mr. J. P. White, of the Pyghtle Works, Bedford, has some of the former on show in every notable design. Such men as J. S. Cooper, G. Jack, W. E. Lethaby, G. Ll. Morris, and C. F. A. Voysey have had a hand in the work, and their excellent drawings have been very artistically interpreted. Mr. White executes general joinery work, but chimney-pieces are his forte.

### MESSRS. W. E. RENDLE AND COMPANY.

AT Stand 67 is shown a model of Rendle's "Invincible" glass roofing. It is a very excellent and durable method, and has been very largely used in the roofing of railway stations. Rendle's has a new system of glazed glass decoration which can add beauty to any building.

### MESSRS. J. CLIFF AND SONS.

THE greatest variety of building material on any one stand is, perhaps, shown by Messrs. J. Cliff and Sons. It ranges from patent bricks to imperial porcelain baths, and includes white glazed channels, patent jointed socket-pipes, Hall's patent hanging tiles, Sherwood's patent partition bricks, chimney-pots, glazed brick fireplaces, and earthenware ornaments of various descriptions.

### M. T. MEDWAY, LONDON.

A SPECIALLY strong and well made self-sustaining dinner lift is shown by Mr. Medway (Deptford) on Stand 33. Hydraulic gears are also made by the same manufacturer, embodying the latest improvements.

### LONDON HOIST AND CHAIN COMPANY.

"THE latest" in the way of hoists is shown by the above Company on Stand 34. Pickering's twin brake hand hoist is the latest development of the well-known Pickering sack hoist, and is fitted with a spring hand brake placed on the top half of the wheel and actuated by two levers, the brake becomes effective no

matter which chain is in use. The utility of such a brake is obvious. By sustaining a load when hoisting it facilitates labour. But that is common to all hoists with brakes; what is claimed for the brake under notice is that it is free from the jerky action of the ordinary kind of Pickering hoist, and that the application of the brake encircling the top half of the chain groove entirely prevents the chain getting off the wheel. Pickering's patent warehouse hoist is also on exhibition. The hoist is self-contained on its own frame, and, therefore, merely requires bolting down to timbers. The brake is automatic in its action, and the controlling rope can be led over pulleys to any position convenient to the operator, so as to give him full control in handling the load. In addition to hoists of other descriptions, the Company has pulley blocks, crane chains, chain wheels, &c., on show.

### MESSRS. EWART AND SON.

MESSRS. EWART AND SON occupy a conspicuous position in the present Exhibition. Theirs is one of the most interesting—if not the most interesting—shows in what, to the professional man, is a most attractive Exhibition. They have on view numerous examples of deep stamping in copper for Architectural decorations, and the large gleaming figures of Homer, and of Socrates, together with many other devices, cannot fail to attract general attention. It is

a very representative illustration of an Art of which Messrs. Ewart and Sons are acknowledged masters, though prominence has, of course, been given to goods coming most directly under the notice of the builder. A particularly fine Capital is included amongst the exhibits, and also a pair of exquisitely worked figures for erection on pediments. Work is shown similar to that which Messrs. Ewart have carried out at the new Her Majesty's Theatre in the Haymarket, where they have constructed a tower wholly of copper, and amongst these exhibits is a specimen of copper balustrading which is worth inspecting. Perhaps Messrs. Ewart's chief speciality, however, is their copper crown ventilator, of which we give an illustration.

So far as we can see, however, this ventilator aims not so much at supplying an improved system of ventilation as the more modest purpose of providing more "substantial" advantages. Its great recommendation is its rigidity and permanence. Its time-resisting quality equals that of—if not the hills, at least the

walls over which it towers. Another exhibit on the stand worth noticing is their copper "Renaissance" tile, which has already won great approval, and is a form of roofing well known to Architects and builders. It looks well, but it is on utilitarian grounds that it bases its claim for favourable notice. It fixes with a patent clip underneath, and, consequently, there are no holes through which water can penetrate. Ewart's have also a model showing their method of laying their copper flat tiling, which, perhaps, is in even greater use than their "Renaissance" tile. It covers many well-known buildings, and, for an illustration, Somerset House has often been pointed to.

#### J. GRUNDY, LONDON AND MANCHESTER.

At Stand 151 Mr. John Grundy is demonstrating a few achievements in engineering as applied to ventilation. His chief exhibit is a sectional apparatus built in brick work, and which introduces a system of heating by pure warm air. The outer air is received into the chamber and is ultimately conveyed into the various parts of the building. Mr. Grundy also shows "Portsmouth" and "Hestia" stoves, which are independent warm air stoves, and the "Helios" patent smoke-consuming grates, which differ from other grates in the treatment of the smoke by means of heated air impinging upon the smoke, thus turning it into gas. By this means about 30 per cent. additional heating power is gained with the entire absence of dust and dirt.

#### THE SANITARY BATH COMPANY, LIMITED.

The usual order of the Exhibition is varied at the Sanitary Bath Company's stand. Their exhibits, as their name indicates, are baths, but they differ from the ordinary make in that they are lined in copper. The bath, which is known as the Steel-clad Copper Bath, is the outcome of a demand, the makers tell us, for a thoroughly high-class sanitary article. It has received the endorsement of numerous sanitary engineers and Architects, and has, since it was first placed upon the market, been in great demand, not only in America, where it was first brought out, but in England and abroad. The bath is made of Siemens-Martin heavy sheet steel, lined with sheet copper that has been specially rolled and planished, the exposed surface of the copper being heavily tinned by a patent process which, when finished and buffed, resembles electro-plate. The bath is supported by an ornamental frame and feet of malleable iron, and is capped with a handsome rim of natural polished wood, the plug and overflow being nickel-plated. The copper lining is so closely fitted to the steel as to render it impossible to distinguish that two metals are used in the construction. The most important advantage of the bath is its great durability. Another advantage accrues from the fact that this bath is quite open and accessible, and therefore does not harbour the dirt and impurities that collect when baths are encased with wood, &c. It has met with a most encouraging sale. A great demand exists for a cheaper bath, and on the same model as the foregoing one has been produced: this bath is made of strong galvanised steel sheets, enamelled inside and painted any colour outside; shape, legs, and rim being the same as for the copper bath. Great care is used in galvanising the steel so as to ensure an even surface for the enamel. Galvanising also prevents the possibility of rust, even if after years of use the enamel should chip off. In addition to the baths, the Company has numerous bath appliances on view, including a patent bath trap for connecting overflow of bath and trapping without a wiped joint.

#### MESSRS. LINE AND SONS.

STAND 71 in Row 6 is conspicuous, more on account of the Architecture of the pavilion than on account of any unusually pretentious display inside. It is occupied by Messrs. John Line and Sons, of London and Reading, who are making rather an effective show of wall and ceiling decorations. About a score of varying

patterns are on view—large swinging screens in the centre of the erection facilitate the display—all of which are the work of eminent designers, and have been manufactured by Messrs. Line's own printing blocks and rollers. Some of the patterns are decidedly attractive and pretty, and though wall paper is not a form of decoration which appeals very strongly to the Architectural taste—some Architects have been heard to speak very sneeringly of everybody and everything connected with paper decoration—yet it is a necessary form of decoration, and one that will be always with us. Some of the best examples are to be seen at Messrs. Line's stand.

relief; and as all can be placed on the market at low rates, Petruia is likely to be considerably used in the future.

#### THE INCANDESCENT GAS LIGHT CO., LIMITED.

For size there are many stands to beat that of the Incandescent Gas Light Co. But as a bright and attractive show it takes premier honours. Naturally, it is easy to invest this stand with glamour, of which the very prosaic building stands are altogether destitute. The powerful incandescent light sheds lustre all around, and conspicuous among the rest is the "Eclipse" lamp, which, with its three burners,

#### THE MURAL DECORATIONS COMPANY, LIMITED.

The Mural Decorations Company, of 50, Milton Street, E.C., has a large pavilion decorated internally with patent plaster work. The ceilings, panels, mouldings, cornices, trusses, scrolls, &c., are really beautiful, a patent process of undercut relief having worked charming effects in some of the designs. The advantages claimed for the Mural decoration are that it is solid in relief, that it does not alter, cringe, crack, or move before or after being hung, and that there is a substantiality and artistic beauty about it which cannot fail to charm. We have no doubt that the claims of the company are in the main justified; of the artistic beauty of the exhibits there can be no doubt, and we are able to give an illustration on this page of a specimen of their work.

#### B. T. BATSFORD, LONDON.

MR. B. T. BATSFORD, of 94, High Holborn, occupies Stand 117, and has technical works for all engaged in the building trades, including a recent work on "Plastering," by William Miller. On the same stand specimens of Petruia artificial stone, plaster, tiles, &c., are shown, having been manufactured by patent process from slate debris. The new patent plaster is intended as a substitute for lime plaster, and is compounded from the "schist" as a basis, is sanitary, impervious, and fire-proof. The cement, the latest of the plaster cements adapted for plaster work and general building purposes, is mainly composed of a waste of bye-product, of which enormous quantities are available. Petruia paving is exceedingly hard, the slate makes a good roofing tile, the stone is capable of undercut

gives a splendid illumination of 180 candle-power. The lamp, in appearance, is similar to an electric light arc, and can be made with only two burners, in which case the candle-power is 120. This lamp is the latest effort of the Incandescent Gas Light Co., so far as street lighting is concerned. Another system of incandescent gas lighting on exhibition is the "Welsbach" system. The "Welsbach" mantle is constructed by impregnating in the salts of certain rare earths the woven cotton or fabric, which, when dried and exposed to a flame, is completely consumed, leaving a residuum composed of the oxides. These, when suspended, as above stated, over the flame of an atmospheric burner, give out a pure white, brilliant light of an illuminating power highly in excess of any form of gas light hitherto introduced. It is claimed for this patent that, having the monopoly of the rare earths, it is the only system of incandescent gas lighting by which the high illuminating power obtained can be retained with any efficiency for a considerable time. The average duration of a "Welsbach" mantle is 1000 hours, whereas it is claimed that by any other system 80 to 100 hours is the extreme limit. Of the economy of incandescent lighting there can now be no doubt. With the "Gem" burners, which are the newest thing on the market, and which give a light of 35 candle-power, the consumption of gas is represented by the small figures of 1½. Besides, the light is especially suitable for decorative purposes, as the exhibits show.

#### THE RATNOR SAFE COMPANY, LIMITED.

UNDOUBTEDLY the speciality among the Ratnor Safe Company's exhibits which appeals most strongly to those interesting in building

trades, is the iron party-wall door, which has many advantages to recommend it to the builder. It is of very good quality and fits into grooves all round, the stiles and rails being jointless. It is made out of one solid sheet. The Ratnor Safe Company, who are quartered near the public entrance to the Hall, and whose address is 51, Moorgate Street, E.C., have other specialities equally interesting in their way. The chief of them is their improved drill-proof unbreakable bullion-vault and strong-room doors. They are colossal structures, and the weight of the one on exhibition approaches three tons. It would certainly be an exercise requiring almost superhuman patience to drill through the various thicknesses of steel which go to make up the three tons, even were the material to yield at all to persistent effort. Fire-resisting and thief-resisting safes are shown on the same stand, and it may be mentioned in passing that they include one which has been specially constructed for the reception of the valuable plate which Mr. Ernest Terah Hooley is presenting to St. Paul's in commemoration of the Diamond Jubilee. In all these safes the fire-resisting chambers, usually of a breadth of 3 in., have been increased to 3½ in.

#### WALLER'S "GRIP-FAST" TILE COMPANY, LIMITED.

THERE are numerous exhibitors in the tile trade, and Waller's "Grip-Fast" Company certainly comes well to the front. Their pavilion can scarcely go unnoticed. It is one of the largest stands in the hall, and its glaring red roof suggests the rustic cottage. This roof has been specially made in order to put the tiles to the severest test so far as construction is concerned. It embraces dormers, hips, and valleys, to demonstrate to unbelieving builders that the "grip-fast" tile is capable of meeting all constructional ends. The cement tile is not a novelty. It has stood the test of years on the Continent, and in introducing it into England the manufacturers seek to make assurance doubly sure by embracing Waller's patent dove-tail grip and patent water drip channel. The tile is made of the best Portland cement, sand, and other materials, and having a glazed surface, introduced by special process, is impervious to moisture, and generally has great weather resisting qualities. The various shapes of the tile—and there are nine in all—interlock, and thereby handsome designs in different colours are readily obtainable, and, the manufacturers tell us, "a neatness of appearance arrived at which, in these days of elaborate and æsthetic ornament, is so essential." And with its advantages—be they few or many—the "grip-fast" tile entails no increased cost. In fact, the price is below the figure at present quoted for slates.

#### MESSRS. H. HERRMANN, LIMITED.

SOME very good modern examples of wood-carving for builders' work are to be seen on Stand No. 11 in row E, which is occupied by Messrs. H. Herrmann, Limited, of 11, Dod Street, Limehouse. Most, if not all, of the work is not pure carving. It is produced by machinery and finished by hand. For all practical purposes, however, the result is quite as satisfactory, and, of course, much more economical. The central feature of the stand is a railway carriage door, and this, together with the panels, is of excellent cutting, and seems to us to be a vast improvement on old press work.

#### MESSRS. MESSENGER AND COMPANY.

MANY kinds and descriptions of "horticultural" iron work are shown on Stand 77. Perhaps the chief exhibit of Messrs. Messenger, whose London address is 96A, Victoria Street, Westminster, S.W., is a section showing span stove-house 15 ft. wide, with imperishable iron sill, oven tins, condensation rafters and bars. It is filled with a patent lever which gives an opening at both front and roof of the apparatus, thus securing advantages of which ordinary span stove-houses are destitute. There is a plant protector on the stall which must appeal to horticulturists. The frame is of iron with wood lights, and so constructed that the

lights may be set open or lifted out. Messrs. Messenger and Company's valves make an interesting display. They include their full-way syphon valve and their improved throttle valve, in which the working parts are so arranged that they can easily be removed for repair without disturbing the pipes. Other exhibits on this stand are varied, and range from iron walks and kerbs for vineries (which are supported at intervals by brick piers allowing for the vine border under walk being top dressed), to a display of oval tube radiators (both single and double), and also a linen fold ventilating ditto.

#### THE CAMEO WOOD-WORKING COMPANY.

IN the same pavilion as that in which Messrs. Messenger and Company are exhibiting, the Cameo Wood-Working Company are showing examples of their work to advantage. As in the case of their neighbours, Messrs. Herrmann, the work is produced by special machinery, and decorations for dados, cornices, architraves, ceilings, picture rails, screens, &c., are on show. One point in the company's work is worth noticing, and that is that the treatment of the wood prevents the burring or crushing of the fibre, and it, therefore, retains its natural colour and remains perfectly solid.

#### EAGLE RANGE AND FOUNDRY COMPANY, LIMITED.

A VARIED display of stoves, ranges, grates, &c., is made by the above company on Stand 173, but, perhaps, the most interesting exhibit is a kitchen range, having a tile canopy fitted with ventilation contrivances for carrying away the fumes and also for ventilating the kitchen. A feature of this range is an inner glass door to the oven, above which there is a thermometer. On the same stand is a new chimney-top, for preventing chimneys smoking, caused through down-draught. A disc seems to be the most essential part of the apparatus, and the difficulty of sweeping is overcome by the work being so constructed as to allow of the removal of the disc. Another exhibit is what is known as the Gold Medal Eagle Grate, which combines numerous advantages over ordinary stoves. Perhaps the greatest advantage is the easy regulation, by means of doors, of temperature. These doors fold back behind the decorative panels when not in use; when closed the fire may be kept in without attention for a space of something like fourteen hours.

#### MESSRS. ASHTON AND GREEN.

MESSRS. ASHTON AND GREEN make a similar display of stoves, &c., to that of the Eagle Range and Foundry Co. Their chief exhibit is a gold medal *Sine qua non* stove. It has a rising fire, and is fitted with under flues to the oven, so as to provide a uniform heat all round. It is convertible from close to open fires, and all steam and smell of cooking is carried away by patent ventilating appliances. It also has an open fire-hood to regulate the draught. The rest of Ashton and Green's Stand is occupied by various enamelled slate and marble mantelpieces, &c.

#### SOUTH KENSINGTON MUSEUM LOAN COLLECTION.

AN interesting collection from South Kensington Museum occupies considerable space in the Gallery, and consists principally of exquisite wood carving. The list of the exhibits is as follows:—Oak panel, carved in high relief with a representation of the legend of St. George and the Dragon. English; 14th century. Carved oak panelling, from a farmhouse, now destroyed, at Kingstone, near Taunton. English; 15th century. Carved oak door, from a former palace of the Bishops of Exeter. English; 15th century. Carved oak panelling and two plasters from an old house near Exeter. English; about 1600. Carved oak Court cupboard. English; 17th century (with restorations). Carved oak cabinet. English; 17th century (with restorations). Carved oak mantelpiece, with frieze and jambs of carved stone, the mantelpiece from a house in Lime Street, the stonework from Bromley-

by-Bow Palace. English; early 17th century. Carved oak mantelpiece, from a house in Lime Street. English; early 17th century. Upper portion of a chimney-piece of carved oak, from Sir Paul Pindar's house, formerly in Bishopsgate Without. English; 18th century. Organ bellows lever of carved wood, from the church of St. Mary Somerset (Somershithe), Thames Street, built by Sir Christopher Wren in 1695. English; late 17th century. Panel of carved plane wood, from St. Sepulchre's Church, Holborn. English; late 17th century. Porch with door frame and jambs of carved wood, from an old house in Great Ormond Street. English; dated 1707. Panel carved with the arms of Queen Anne. English; about 1710. Lead Cistern, removed from the Royal Agricultural Society's house, 12, Hanover Square, English; dated 1732. Chimney-piece of carved pinewood, from a house in Carey Street, Lincoln's Inn Fields. English; early 18th century. Portions of a frieze and cornice of carved pinewood, from an old house on Richmond Hill. English; 18th century. Chimney-piece of carved pinewood. English 18th century. Clock in inlaid case by "Mansell Bennett, at Charing Cross." English; middle of 18th century. Cornice of carved pinewood, from the Palazzo Bensi Ceccini, Venice 16th century. Metal Casting of Door Plating. The original, of cast bronze, was formerly in the Mosque of Beybars I at Cairo, and is now in the South Kensington Museum. Saracenic; 1266-1268. Electrototype reproduction of a copper door made by the coppersmiths of the Golden Temple of Amritsar, for the Indian and Colonial Exhibition, 1886; modern Indian. Panel of Tiles in imitation of Damascus tiles of the 16th century; made by the Derby Tile Co.

#### MESSRS. MATTHEWS AND YATES.

MESSRS. MATTHEWS AND YATES are trying to solve the vexed question of ventilation. They forsake automatic means and resort to mechanical, which is an absolute necessity under certain conditions—dealing with a smoke-room, for instance. It has been found impossible in practice to move air in sufficient volumes by means of cowls, louvres, and flues, and Messrs. Matthews and Yates seek to remedy the defect by their "Cyclone" air propellers which are built for both continuous and alternating currents. One advantage of the design is that the parts additional to the fan which revolve are close upon the axis, and not, as is often the case, upon the periphery. A 48 in. electric fan, similar to the one on exhibition, has been tested by Mr. W. H. Preece, Chief Electrician to the Telegraphs, who finds that with 250 revolutions per minute, 13,000 cubic feet of air is discharged during the same period. A similar fan, differing only in the motor, made for dealing with alternate currents is on show; and we may state that these "cyclone" air propellers have been fitted up by Messrs. Matthews and Yates at numerous hotels and restaurants, including The First Avenue, The Trocadero, Romanos, and The Criterion. The firm believes automatic ventilation to be a delusion, and certainly is taking effective steps to dispel it.

#### VAL DE TRAVERS ASPHALTE PAVING COMPANY.

VAL DE TRAVERS rock asphalt is displayed on Stand 15. It is a limestone rock, naturally impregnated with about 8½ per cent. of bitumen, and comes from the mine at Travers, Neuchâtel, Switzerland. Specimens of compressed paving, cut up from the surface of carriage way after several years' traffic, are shown, and also grit from the seashore employed in proportions in the manufacture of mastic. Mastic is cast into blocks, and on the works, is broken into pieces, melted in suitable cauldrons, and in a semi-fluid condition spread on the surface of a concrete foundation to form paving for footways, platforms, warehouse floors, &c. There are models on exhibition showing section of roof covered with asphalt, and an asphalt damp course in walls, besides other specimens of the material after long usage.

## MESSRS. MITCHELL AND COMPANY.

For something new and novel recommend us to Messrs. Mitchell and Company, of Drury-lane. They make a very large show of fire-glazed goods at the entrance end of the Hall, but their stand is chiefly noteworthy on account of the many specialities, principally in the way of lavatory basins, it contains. In the principle of one of their latest wash-basins they go right back to nature. They provide a mechanical imitation of a running fountain, which obviously does not merely appeal to sentiment. With an incessantly running stream of water, flowing upwards, sediment at the bottom of the basin is unknown. This seems to us to be as it should be. The same principle of a running stream is embodied in another wash basin, shown by

Messrs. Mitchell and Co. This example is older than the one just referred to, and in our opinion is not so perfect, though it certainly answers the same purpose as basin No. 1 in precluding any settlement of sediment. On the same stand we find numerous examples of fireclay slop sinks, and here, too, there is a speciality which arrested our attention. It is a sink which has been constructed to meet the requirements of the London School Board, and is glazed both inside and out; it has a specially large waste fitting with a vulcanite fibre block and a removable grating. Another sink, known as Chrisolm's patent "Ideal" sink, is something out of the ordinary, but its utility beyond preventing overflow does not specially appeal to us. Messrs. Mitchell and Co. have also made a modest attempt to improve interceptors, and in this they have

certainly succeeded. "Mitchell's Valve" consists of a heavy valve flap attached to the mouth of the clearing pipe, and it is so contrived that when dropped it constitutes a perfectly secure joint, whilst at the same time it can be opened by means of an attached chain should the flooding of the chamber necessitate such a course.

## MESSRS. HEATHER AND SCOTT.

A NOVELTY which the present Exhibition has disclosed is the photo-decorated tiles shown by Messrs. Heather and Scott. The process, which has just been discovered, is, of course, a patent, and by it, photographic representations of any subject can be transferred to tiles, and its permanence ensured by an outer glaze. The examples shown include landscapes, numerous figures, and well-known objects of interest; but whether these photo-decorated tiles will ever become generally used time will reveal. Certainly, the discovery is one which others, besides Messrs. Heather and Scott, have long tried to make.

## MESSRS. G. AND F. COUZENS.

THE number of improved and patented sanitary appliances shown at the present Exhibition is something extraordinary. Messrs. Couzens are among the greatest offenders. Their exhibition is confined to a few sanitary specialities, and among others we may mention their patent ball and flap valve gully traps, their ball valve and syphon interceptors or inspection chambers, and their patent ball valve water-closets. The first-mentioned patent is designed to prevent the back flow of tidal or storm water, and the uprising of sewer gas. The action in each case is automatic. In the first example of the patent, any back pressure of water raises a copper ball against an india-rubber seating, thus making an effectual seal. Should the

water evaporate, as is sometimes the case in dry weather, the ball lowers on to the bottom seating, and thus an effectual hindrance to sewer gas rising is secured. In the second example, a door, with a weighted lever, allows water to pass into the gully, and closes automatically; thus it serves the same purpose as in the previous case. The same principle is also applied in the ball valve tidal interceptors, whilst it affords an easy access to the drains, and would greatly facilitate operations in case of a stoppage. In the mechanism of the syphon interceptor, or inspection chamber, the iron cover joints are gas and water tight, being bedded in suitable material and secured to the earthenware with brass screws. They are therefore self-contained, and in most cases brick manholes and manhole covers are not necessary.

## JAMES JONES, BIRMINGHAM.

THE latest patent for providing reversible window-sashes has been brought out by Mr. J. Jones, of Birmingham—Stand 113—whose fittings have been pronounced by authorities to equal in simplicity and effect those of any at present on the market. With Mr. Jones's system no springs, pivots, or extra woodwork are required. Part of one inside bead is hinged to allow the bottom sash to be taken out of the frame. Part of one parting bead is of brass or iron attached to the pulley stiles with pins. The cords are attached to lower part of sash stiles, and act as centres to reverse the sashes. Thus the windows can be cleaned, the glass repaired, and the woodwork painted inside the room; and another point—the old sashes can be made reversible just as well as new.

## MESSRS. R. CRITTALL AND COMPANY.

IT is satisfactory to note the efforts made by heating and ventilating engineers in bringing their various appliances nearer perfection. Messrs. Crittall are to the front, and are exhibiting their latest patent in the way of ventilators. The "Honeyman" is made both with a single and double diaphragm, the first for fixing in open timber roofs, and the second for use in roofs with closed ceiling. A 12in. "Honeyman" ventilator, when acted upon by the wind, has an exit area of 144 superficial inches, which is equal to the exit area of most turret ventilators of very much greater diameter. Another point of importance is that the exit area of this ventilator is very much increased when there is a dead calm, and it thus overcomes a great difficulty encountered in other varieties. Messrs. Crittall also have on their stand-radiators, cast in separate sections and put in with nipples which are screwed right and left. They are made in plain and ornamental patterns, the company having made and fixed 25,000 superficial feet in all parts of the kingdom.

## C. WATSON, NAPTON-ON-THE-HILL.

MR. C. WATSON, brick and tile manufacturer, of Napton-on-the-Hill, near Rugby, makes a quiet show of sanitary materials, tiles, chimney-pots, &c. His stand is near Messrs. Stanley Brothers. His principal exhibit is his improved patent roofing tile—and, by-the-by, the number of patent tiles in this year's exhibition is something extraordinary. Mr. Watson, however, works on new lines, and his patent is designed for the purpose of preventing rain from being beaten underneath the tiles and into the roof. To obviate this is a laudable object. The ridges of the "Fluted Faced Tile," as Mr. Watson calls his patent, ensure the equal distribution of the rain over its surface, and the stops at the end of fluting, which are about two inches above the bottom edge of the upper tile, prevent the rain from being driven further up the tile, and at the same time the fluting provides a ready means for its down flow. The use of the tile certainly does not detract from the appearance of a building, and its chances of success are therefore by no means remote.

## MESSRS. WOOD AND IVERY, LIMITED.

STAND 101 is occupied exclusively by the durable blue brick of which Messrs. Wood and Ivery, of West Bromwich, are very large manufacturers. Almost every kind of blue brick is on view—bricks for sewerage work, railway work, footpath paving, stable paving, channelling, &c.—and samples are included of the bricks being supplied by Messrs. Wood and Ivery for the great Midland water-works scheme. Of course, the great thing about the bricks is their durability. They are absolutely impervious to damp and moisture, and as a solitary instance of durability the exhibitors point to Charing Cross, where their bricks have been used for thirty years, and are as sound to-day as ever.

## L. TOLD, DUNDREY, BRISTOL.

HIDDEN in a corner of the great Exhibition is an interesting exhibit in the shape of a model of Dundry Tower, made of Dundry free stone. Many Cathedrals in the West of England and in Wales are built of the same stone.

## C. H. BROODBANK, LONDON.

THERE is an unassuming exhibition of French and American slates on Mr. Broodbank's stand, Bay 22. The French slates are manufactured of material from the quarries of Messrs. Larivière and Company, of Angers, and the quality is claimed to be equal to the average Welsh slates. A large quantity has been imported into England during the past few years. The American slates are from the Bangor district, and the rate of importation during the last two years has greatly increased, the slates having even found their way into South Wales. Mr. Broodbank also shows some French steel-wire ropes for building purposes, and maintains that they stand as high a tensile test as the work of any of the English makers.

## THE LINOLEUM TILE COMPANY, LIMITED.

STAND 76 is given over to a display of linoleum tiles. They are specially adapted for use in churches, hospitals, clubs, &c., as they are noiseless and not slippery. They are made in many patterns and colours, and can be laid on wood, stone, or cement.

## THE PARAGON PATENT GLAZING AND ROOFING COMPANY.

THIS company occupies Stand 126, and shows practical illustrations of patent glazing and roofing, which it is maintained not only combines all the advantages of other systems, but also incorporates new features. Its chief aim is to surmount the disadvantages involved in the periodical painting, &c., of ordinary glass roofs, and to accomplish this aim, it substitutes simple locking internal fastenings for bolts and screws, and omits outside fastenings, thus removing the difficulty of corrosion resulting from the action of the atmosphere consequent upon iron being used in contact with zinc or other metals.

## MESSRS. WILSON AND COMPANY.

THE trade is in want of a good pavement light, and Messrs. Wilson and Company, who are exhibiting on Stand 35, offer a light which is so constructed as to prevent slipping, and also to meet the objection so often raised to projecting studs on the surface of the lights. The upper portions of the frames are made entirely of lead, and, therefore, provide a firm foothold and give an opportunity for decoration in the way of lead bars intersected with ornamental tile or mosaic work. Messrs. Wilson and Co. also have a horizontal light which prevents the moisture formed by condensation falling on anything below. We can strongly recommend these lights.

## LYTE'S METALLIC WOVEN STAIR TREAD COMPANY.

THE above company shows a model, on Stand 29, of its woven stair tread, the charm of which is the pleasantness of the tread. In durability it ranks before lead, and it has already been largely in demand.

## MESSRS. SUTTON AND COMPANY.

BUILDERS may rely upon seeing something new on Messrs. Sutton and Company's stand. Their exhibits include more than one notable novelty in sanitary goods, and first of all we may mention Rayner's key-joint and double socket pipe, which is made in two different ways, No. 1 with a stoneware inner socket, and No. 2 with a composition inner socket. The advantages claimed for the patent are that it is self-centring, key-jointed, watertight, and that the cement cannot be washed out of the socket. Messrs. Sutton have numerous examples of Green's patents on their stand, and they include his "stopless" disconnecting and ventilating interceptors, S. and P. traps, and soil and ventilating hoppers, stoneware channel blocks, &c.

## THE SOUTH WESTERN POTTERY.

ANOTHER display of stoneware pipes is made by Mr. George Jennings, of the South Western Pottery, Parkstone, Dorset. As a display it, however, falls far short of that of the Albion Clay Company. There is a great variety of pipes on the stand, all made from Dorset clay.

## MESSRS. BRATT, COLBRAN, AND COMPANY.

MESSRS. BRATT, COLBRAN, AND COMPANY have a collection of stoves, ranges, grates, &c., which are noteworthy more on account of newness of design than structural improvements. They show a wrought iron dog stove, which has a square recess lined by five by five Dutch tiles, with copper balls on dogs. Other exhibits attracting attention are a fine mantel, painted white, with a double row of six by six Dutch tiles on the flat, and a mantel of Jacobean design, with marble slips and wrought iron stove front, a copper hood, and copper discs. The combination of colour in this mantel is very pleasing, the tiles being of a pinkish madder, and the marble slips and kerb in levanto. All the designs are the work of Mr. Oliver E. Bryan, but the Company also executes special works for Architects.

## PETRIFITE, LIMITED.

"PETRIFITE is one of the most startling of modern discoveries" we are told. It has not long been upon the market, and is consequently little known. Its use is for solidifying materials without mechanism, and it is claimed that all materials, no matter of what nature or description, are equally apt subjects for treatment. Remarkable results have already been obtained, and some authorities have gone so far as to say that Petrifite will revolutionise the whole building trade. With it, articles of use and beauty are manufactured from such materials as ashes, destructor refuse, garden mould, slate, sand, straw, road sweepings, and an endless variety of things of little or no value. Building materials composed of such ingredients are shown in the present Exhibition, and must be quite a revelation to many. Its facility of application and great durability, together with its cheapness, must give it a leading place for decorative purposes.

and as evidence of its durability—if evidence be needed—there is shown a pipe which was taken out of the ground in a perfectly sound condition after having laid there for twenty-five years. Professor Tyndall's patent—double seal pipes—is on exhibition, and the advantage claimed for it is that it supplies a perfect joint. It is a justifiable claim for, in addition to a composition which makes the joint watertight, matters are made doubly secure by an additional cement joint. The patent has been on the market for some time, and has been used very largely in Government works. An exhibit on the same stand, with a greater claim to novelty, is a glazed stoneware electric cable conduit. It, also, is made of Dorset clay, and when used, a junction piece may be added at any time without disturbing the conduits. Mr. Jennings has also some terra-cotta work on show.

## THE LONDON MOSAIC COMPANY.

The London Mosaic Company is making an unpretentious but interesting show of mosaic work, for both decorative and flooring purposes. It occupies Stand 86; the firm's address is 13, South Wharf, Paddington, W. Italian marble, Ceramic mosaics, stained glass, mural painting, parquet and wood block flooring, encaustic tiling, marble tiling are its specialities; the parquet flooring being worth special mention for the decorative patterns and high finish of the work.

## ADAMANT CO. LIMITED.

THE qualities of Adamant as a patent decorative plaster, are well extolled by the structure in which the company is exhibiting. The external appearance is rather striking. A highly decorative arch is surmounted by a frieze, cornice, and spandrels, the whole supported by fluted columns. There is a double entrance, and the panels in the interior exhibit Adamant in different qualities, the best being capable of a very high polish. The plaster can be set up in any design in extreme frost, and can be painted and decorated before the men leave the scaffold. It is claimed that Adamant does away with warping and shrinking of doors and casings, as water is not required as in the case of ordinary plaster, and that it does not absorb germs of disease. "Adamant," however, is not so cheap as plaster.

## LIMMER ASPHALTE PAVING COMPANY, LIMITED.

STAND 70 is full of specimens of the Limmer Asphalt Paving Co.'s work, of the raw material as it comes from the mines, and as powder, when the rock has undergone the grinding process. Excellent testimony to the durability of the asphalt is borne by two pieces shown on the stand, which have been taken up from City roadways after lengthy service, and which are nevertheless in a perfectly sound condition—as hard as the proverbial rock. Blake's Patent Bituminous Culvert is also shown; it is constructed to receive all kinds of wires to be laid underground. It is rather an ingenious patent, and answers its purpose well.

## MESSRS. YATES, HAWOOD, AND CO.

THE most notable exhibit on the large stand occupied by the above company is, perhaps, an example of the latest invention in cooking ranges. It is known as the patent "Quadrant" Kitchener, which not only recommends itself on economic grounds, but has the great advantage over older ranges in that it gives a uniform heat throughout the ovens. It has a self-adjusting lifting-fire, and can be raised or lowered to any point with one hand. The moveable parts do not come in contact with the fire, and consequently the apparatus is not specially liable to be thrown out of order. The "Quadrant" is made either with single or double ovens, and seems to be up-to-date in every respect. A massive iron mantel is also shown on the same stand, and though it does not lend itself to the same decorative treatment as wood, the utilitarian mind will at once approve of it. Wood mantels and overmantels are also exhibited along with other patents in fire ranges.

## A. T. COOPER, LONDON.

ANOTHER exhibit, more or less novel, is a patent suction and vacuum pump, shown by Mr. A. T. Cooper, of Moray Road, London, N. The pump is a simple contrivance in which a rubber disc is the most essential part, and in working it for the removal of obstructions in drains, soil pipes, baths, sinks, stack pipes, &c., the disc is placed on the surface of wherever operations are to be carried out, and by the strong suction of the pumps action, obstructions, provided there is no structural difficulty, are speedily removed.

## MESSRS. PILKINGTON AND COMPANY.

STAND 134 is occupied by examples of the Seyssel asphalt paving, Poloucean asphalt paving, and asphalt roofing, on Pilkington's patent system. The Seyssel asphalt is a natural product procured from the mines in the district of Seyssel (France), and is especially suitable for covering flat roofs and terraces; whilst it can also be used, with satisfactory results, for paving corridors, courtyards, tennis courts, and so forth. Poloucean asphalt is superior in quality to Seyssel, and is especially manufactured for paving carways, approaches to warehouses, &c., where very heavy traffic occurs. One advantage it possesses in this respect is that its surface can be grooved, to render a foothold for horses. Applied tests have amply proved the durability of Messrs. Pilkington's asphaltes.

## W. S. FOSTER, LONDON.

MR. W. S. FOSTER shows, at Stand 32, a bay window and carriage door fitted with his patent spring and rack. It is rather an ingenious device for maintaining window sashes open with the desired depth of aperture. Its construction makes it especially useful for railway carriage windows; but it can also be applied to sash windows of any kind. Its use in sash windows enables the centre and sides of oriel and bay windows to be opened. Window inventions are plentiful, but Mr. Foster's patent is obviously sound and useful.

## MESSRS. RANDALL BROTHERS.

"THE effect of white tiles or glazed bricks at one-tenth the cost" is something which must recommend itself in cases where economic laws press heavily. This is what Messrs. Randall Brothers claim for their Paris white japan. Moreover, they maintain that, on sanitary grounds, it is superior to white tiles as it leaves one continued smooth surface with no interstices or crevices for the lodgment of dust, germs, &c. It is equally pliable on plaster, cement, bricks, wood, or iron, and the finish, as shown in the firms exhibits, is more than satisfactory.

## W. OSMENT, LONDON.

MR. W. OSMENT, of the Clapton Steam Joinery Works, shows numerous examples of spiral, plain, square, and ornamental turning. Mr. Osmont also exhibits his patent window fittings, which allow of new sash lines being inserted without removing the beads—except a small piece of the parting bead.

## THE CORK PAVEMENT CO., LIMITED.

GREAT advances have been made in street paving during the last fifty years. But there is still much to learn. The Cork Pavement Company, however, is taking a leading part in present day improvements, and associated with its paving are as many qualities as have yet been combined with any one brick. Its durability alone would be a sufficient consideration to keep it well to the front; but happily it combines other virtues—it is non-slippery, practically noiseless, almost non-absorbent, sanitary and cheap. As the name implies the bricks are made of cork, and are combined by an ingenious process with a description of bitumen. The material, says Professor Redwood, is remarkably tough and cohesive, and is sufficiently elastic without being too easily compressed or indented. The bricks can be used not only as a road paving, but they can be introduced into stables, coach-houses, lavatories, &c. The company's stand is floored with these bricks.

### Gesso Duro as a Decorative Material.

Now that the revived gesso duro has apparently taken a permanent place as a material for Decorative Art, a short history and brief description thereof may not prove unacceptable to my readers, especially when it is borne in mind that specimens of the work form regular exhibits at our Art Schools and at the Royal Academy, while it is also of great use to modellers and decorators. At the outset it may be as well to point out the difference between stucco and gesso duro, as gesso, burnt gypsum, or plaster of Paris, is employed in both. Vetruius, a celebrated Architect of the time of Cæsar Augustus, gives a recipe for stucco for painting upon, consisting of slaked lime or gypsum (plaster of Paris), which were to be mixed with water; and he particularly insists upon the materials being well soaked, in order that the burning properties of the lime might not injure the pigments. The Romans of ancient days were very proficient in the employment of stucco work, though they were not the first to use it. Soaked lime dates back to very early times, for we find that the highly-decorated mummy cases of the Egyptians were made of linen saturated with acacia gum, and moulded into form, which, when dry, becomes exceedingly hard, forming a thin shell, afterwards primed inside and outside with soaked lime, thus forming the white ground upon which the designs were drawn, with the colouring and gilding filled in as handed down to the present day. The secret of the colours retaining their pristine brilliancy is that the lime or plaster had been previously well washed. The employment of stucco was not confined to the minor part of ground- ing, for about the period of the second century gesso was used for ornamentation, as borders composed of it have been discovered, having a continuous design placed round the portraits in the wooden coffins containing mummies from Fayum. It was, however, at a much later period that stucco reached its perfection, and the Villa Madonna at Rome is one of the finest examples of this work that can be found. It was designed by Julio Romano, who executed the paintings, while the reliefs are in all probability the labour of Giovanni da Udine, a noted workman of the time in stucco. Coming to more modern times, there are many ceilings in houses of the eighteenth century which are admirable specimens of stucco, being the work of a colony of Italian Artists settled in London, but who travelled around the country. Working in gesso may be said to be a painter's rather than a sculptor's Art, as it roughly consists in covering the surface with a mixture of plaster of Paris and glue, or similar composition, high relief being obtained by repainting the parts desired to be raised, and still higher relief by modelling with teased wool soaked in the plaster and glue, and when dry being painted or glazed in colours. Gesso duro has precisely the same basis as stucco, viz., gypsum, or plaster of Paris, but it is mixed with glue or size while warm and in a liquefied state. It is with this mixture that decorative works of the fourteenth, fifteenth, and sixteenth centuries were made, and Cermينو Cermينو, who lived in the fourteenth century, has

handed down to us a considerable amount of valuable information on the Arts of that time, the instructions in which apply equally to modern work, and for which we are indebted to some of the recipes given in succeeding lines. He begins by giving instructions for preparing wood panelling with strong glue made of parchment, which must be of a consistency to stick the hands together. The panel was to be made level by having knots cut down and holes stopped, and, a coat of parchment size having been spread over, Cermينو proceeds as follows: "Get some linen cloth, old fine white, and free from grease; take your best glue, cut or tear the linen into large and small strips, soak them in the glue, and spread them with your hands over the surface of the panel, leave it to dry for two or three days; when very dry, rasp it well. Then take some

panel before priming, which was then to be passed over the whole, clearing up the design after each coat, and giving two coats of gesso sottile, or fine plaster, to finish with. The recipe for making the fine plaster is thus: "This is made from the same plaster as the first (gesso grosso), but it must be well washed (purgata), and kept moist in a tub for at least a month, until it almost rots (marcise), and is completely slaked; it will become as soft as silk; throw away the water, make it into cakes, and let it dry." The following gives the finishing process: "Having laid on the gesso grosso, rub down the surface, and polish it well; put some cakes of gesso sottile into a pipkin of cold water, let them absorb as much as they will. Put a small portion at a time on a slab, and grind it without adding any more water, and when you have sufficient put it in a

DOORWAY TO CLOISTERS OF S. GREGORIO, VENICE. BY HOWARD INCE. SEE PAGE 102.

gesso grosso (which is really ordinary plaster of Paris) sifted like flour, put a porringer full on the porphyry slab, and grind it well with this glue as you would colours, collect it, and put it on the surface of the panels with a large spatula, then take some of this ground plaster and warm it, for by this time the glue will have chilled, and materials mixed with size should be used warm. Take a soft hog-hair pencil, give a coat over the cornices and foliage on the even surface with the spatula. Procure some small iron rods, and with these pick out all the cornices and foliage which are not flat." Referring to the same authority, it will be found that the raised work was done in two different ways; the first of making the prominent parts of plaster of Paris, and glue on the

piece of linen cloth, strong and white. Take some of the same glue with which you tempered the gesso grosso, take a new glazed pipkin, take a cake of the damp gesso, scrape it fine with a knife as you would cheese into the pipkin; put more of the glue on to it, stir the gesso as you would paste for making fritters, smoothly and evenly, until there are no lumps in it. Procure a cauldron of water, put into it the pipkin of gesso, thus it will become warm without boiling; when warm, take up a proper quantity of the gesso with a soft hog's-bristle pencil, and spread it evenly over the level surfaces, the cornices, and the foliage. The first coat should be spread and rubbed in as much as possible with the fingers and hand, to incorporate it with the gesso grosso. When this has

been done spread again with the brush without using the hand, letting it dry partially; then pass over a third time with the brush, and let it dry. Then give a coating on the other side in this manner, keeping the gesso warm—giving eight coats. Foliage and reliefs require less. This finishes the first process, and the second is as follows:—"How to prepare grounds of gesso sottile: First pass glue three or four times over the panel and all small and delicate works; give as many coats as from experience you find them require." For small panels and delicate work the glued down strips of linen were not necessary, but till a late period pictures were painted on linen, glued in one piece on to the wood, and in the *cassone* of the fourteenth and fifteenth centuries two very fine specimens of which were exhibited at the New Gallery two years since, while others are to be found at South Kensington—the chests were always covered with the linen cloth and then primed with gesso. The linen may be seen at the broken edges of the chests, and it serves to distinguish them at once from the chests of carved wood. When no gesso grosso was used the size was made thinner, water being added to the glue used in preparing the gesso. In working, the panel having been prepared, the design was sketched in in ink on the flat portions, while those which were to be gilt were outlined with a needle. Fringes, borderings, cornices, and foliage were now to be raised with the gesso sottile, a little bole being mixed with it to prevent any minute defects in the gilding and linning, and to make the gesso a stronger mordant. In doing the raised work, the instruction proceeds: "Having the gesso in a vase on hot ashes, and other vase of hot water (because you must wash your pencil frequently, and this pencil must be of miniver, the hair fine and long), take a little of the gesso on the point of the pencil, and with it raise what figures you wish in relief. If you make any foliage draw the design previously, and be careful not to relieve too much. The clearer you make the foliage the better you will be able to make the design." It was at this stage of the process that the imitation gems of coloured glass were introduced, such as are to be found in the works of Crivelli and other Artists of the fifteenth century, a good specimen of which is to be found in the altar piece by this Artist in the National Gallery, where the crown and dress of the Madonna are so enriched. This work also affords means of studying relief work in gesso, and the Tuscan School affords many other fine examples. In the sixteenth century, however, working in gesso fell into disuse, the last remnants of it being seen in the bodies of costumes painted by Perugino, the greater Artists ignoring it altogether. In the fifteenth century, it was very extensively employed for modelling on a large scale, and it is more than passing strange that so convenient a medium for modelling on an extensive scale, especially for works to be cast in metal, should have been so utterly ignored in England till quite recent times—in fact, till 1886, when Mr. G. F. Watts, R.A., was commissioned by the Duke of Westminster to execute a colossal statue in bronze of Hugh Lupus. It is to Mr. Watts that Artists are really indebted for the introduction of this handy medium into England, which should be specially welcomed by Decorators, be they masters or journeymen, although the Japanese have made use of gesso work in their lacquer work from the earliest times. For the interior decoration of our Churches, gesso should be particularly adopted, if properly designed and applied, but the site and surroundings of the decoration should be taken into consideration. Gesso must not be in too high a relief, or it will probably crack, but it should be only sufficiently raised to afford a good

ground-work for decorative painting. With such a groundwork, true colour can be used with greater freedom and daring than it is possible on the flat, and for a cheap, simple, and highly effective decoration for the interior of halls and Churches, there is not much to beat properly executed artistic gesso work.

#### DOORWAY TO CLOISTERS OF S. GREGORIO, VENICE.

ALL students of Venetian Architecture, and, we may even say, all visitors to the Queen of the Adriatic, will remember the square-headed, almost square doorway giving on to the Grand Canal, just before it curves past the steps of Santa Maria della Salute. Our illustration is from a measured drawing by Mr. Howard Ince, and is interesting as an illustration of the free, we may fairly say free and easy, way in which the enrichments on the flat moulded architrave are set out. The result is not at all disturbing—it has even a certain quaint charm; but who would dare to set out such a piece of detail nowadays. A further charm, which a monotone reproduction can only vaguely suggest, is found in the rich stains and colouring which Time, who is now very fully occupied at Venice, has thrown across the marble, bringing it into the happiest harmony with the surrounding brick-work.

#### ARCHITECTURAL PHOTOGRAPHY.

IN the first of a series of illustrated articles on this subject in the "Amateur Photographer," Mr. G. A. T. Middleton says that Architecture and Photography appear at first sight to be Arts of such utterly diverse character as to have no points in common whatever. But first impressions are often mistaken ones. All Arts are one, in fact, and though some are more closely related than others—Sculpture, for instance, being more closely akin to Architecture than is photography—the family resemblance is always to be found if sought after. When it is intended to represent one Art through the medium of another, there must be this seeking else a wrong impression will probably be conveyed, and in the photographing of Architectural objects there is, or should be, this representation. Too often the result is a hard unfeeling view, utterly devoid of sentiment, however much there may be in the building represented—a photograph has been taken, but the camera has been treated as an exact scientific instrument, and not as a workman's tool capable of responding to its master's touch. The difference is precisely that between Architecture and mere building—the one instinct with life and feeling, the other no more than a heap of materials scientifically pieced together to enclose a room within four walls. Here it is that the

#### POINT OF CONTACT COMES.

Architecture and photography are both reflective Arts, and so he who would photograph Architecture aright, not for the purpose of scientific diagram making, but to represent the effect produced on the senses by the object illustrated, must have at least some idea of what sentiment may naturally be expected in any given building, else, not knowing, he cannot look for or find it. Architecture has at all times reflected the feelings and aspirations of the people among whom it has flourished, and in some instances is the only index left to us to show that the nations of antiquity were not composed of dolls or automatons, but of living, thinking, loving, hating human beings, like unto ourselves. The Pyramids of Egypt, for instance, tell of a people to whom stern simplicity, solidity, and mass, as representing power, were more than that elaboration of detail which indicates refinement, this being found in its highest perfection in the Grecian work of a much later date, applied to hard and rigid outlines mathematically corrected to produce the effect sought after—indicating

cultivation of mind, but little soul. Then Rome, with its aggressive militarism and its sensuous private life co-existent, is magnificently exemplified to us by the stern remains of aqueducts, and roads, and forts, and by its gorgeous carving and mosaics. Then in England alone we have

#### BUILDINGS WHICH TELL ALOUD

to him who cares to read of the life of our forefathers as nothing else can do. There is the stern work of the Norman feudal lord, followed after but a short interval by the elaborate soul-elevating Early Gothic of the days of chivalry. The Norman buildings of the twelfth century, with their thick walls, massive construction, semi-circular arches and flat proportions, all, whether castles or Churches, speak out of the masterful repression by the mailed warrior of a subject people; and the contrast is most marked with those of the following period, having thin walls, lofty proportions, and elegance both of general form and detail, all combined with perfect workmanship. It was an age whose spirit is best appreciated in its Architecture—an age of lofty aspiration, true nobility and manliness, when the armed men lived for honour. It was the time of the Crusades, when everyone, and all they did, was inspired by a noble, even if we now think in some respects a mistaken, Christianity, and our great Cathedrals and Abbeys, as well as our village Churches are, all alike, the monuments of the age, reflecting its glorious energy and its high ideals. But, as at all times, excessive zeal soon wore itself out, and the brilliant early Gothic period in France and England was as evanescent as had been the brilliant age of intellect in Greece. First came development and then deterioration in the objects and in the lives of the people, reflected, as it was bound to be, by the Architecture. The Ecclesiastical work showed the change most plainly, as the simply living, holy men of early monastic times were succeeded by those who put ostentations display first. There is always something substantial, however, in English Architecture, redeeming and often obliterating the defects of even the most luxurious times, and rendering in stone the difference of character between the English and the Continental nations. If it is all this which Architecture tells, it is this, likewise, which photographs of Architectural subjects should reflect. Find out what your building means, and endeavour to represent that rather than the dry-as-dust Archaeology of moulding and of date.

#### SETTING OUT PROBLEMS.

##### No. III.

WE have pleasure in announcing another of the series of Problems it is our intention to give from time to time, as stated in our issue of May 20th last.

##### PROBLEM.

It is required to take a cross-section of the bed of a river, shewing the depth at every 10ft. along a given straight line lying nearly at right angles to the stream. The banks slope gently to the water, which is known to be about 100ft. in breadth, and not more than about 8ft. or 9ft. in maximum depth. Circumstances preclude the erection of temporary staging. A small boat is available for use; but owing to the current it is found impossible to row her along the line of section to take soundings with the requisite accuracy.

To the authors of the first ten correct solutions of this Problem received at the Office, Volume IV. of THE BUILDERS' JOURNAL, bound and gilt-lettered, will be awarded. Solutions should be addressed to the Editor, and marked "Problem" on the envelope.

The postal authorities have not yet intimated their decision as to the selection of a site for the new Post Office for Aberdeen. The general belief is that Guild Street will be finally chosen as being the most suitable position.

## ITALIAN RENAISSANCE ARCHITECTURE.\*

THERE is no need for the almost apologetic terms in which Mr. Anderson introduces his book to his readers. It has long been needed, for it gives a clearly-written, dispassionate account of the wonderful designs made between the years 1420 and 1700, which, viewed as a series, form the Architecture of the Renaissance in Italy.

Had he done no more he had done well, for it may be said that, hitherto, the writings on this subject have been inspired by a strong partisan spirit, the real origin and meaning of the designs being obscured in the endeavour to prove that they illustrate either the greatest or the most disastrous period in Architectural history—according to the personal prejudice of the writer. Seeing the faults of the later (decadent) work as clearly as

CAPITAL MEDALLION PAZZI CHAPEL,  
FLORENCE. BRUNELLESCHI, ARCHITECT.

the merits of the earlier and culminating periods, Mr. Anderson is not merely more judicious in his criticism, but more scientific in his method. Concisely, and without missing a point, he traces out the causes from which the movement sprang, he shows us the circumstances and surroundings which, acting on the individuality of the Artists, led them inevitably and almost unconsciously to design as they did. It is this careful enquiry into the motives which gives his book its greatest value, and enables the student, for the first time, to grasp the true significance of the movement: the conclusions to which this enquiry lead, emphasising as they do the main principle of good design, its most essential quality—vitality, make the book moreover one which is worthy the study of all.

Assuming that the student of the Renaissance will be to some extent familiar with the ancient Roman Architecture, Mr. Anderson tells him that "almost equally essential to a proper understanding of the revival is an acquaintance with the Romanesque and Italian Gothic styles, in the variations of which there is a vivid picture of the struggle of the races which peopled Italy in the Mediæval period. St. Mark's, Venice, St. Ambrogio, Milan, Pisa Cathedral and San Miniato, Florence, are, for example, contemporary Churches; Byzantine, Lombard, Romanesque: without the slightest cohesion of style, except in so far as they represent the modifications exercised by different peoples upon the Latin element which lay underneath. . . . The necessity

for the study of the interval separating the Roman era from the Italian revival may not be so apparent, seeing that it is generally believed that the Italians of the fifteenth century took up Architecture at the point where the ancients laid it down. This they did eventually, but any such view of the origin of the Renaissance Art is not only incomplete, but wrong. Though the suddenness of the change and the sharpness of the cleavage may have been unparalleled in history, it was impossible that hand and eye and mind should not have been unconsciously, even unwillingly, tenacious of what had been their habit through generations. Renaissance Architecture had a long experimental career . . . and was modified throughout very materially by all the work of the Mediæval period." It was this grafting of new methods on old traditions which formed the strangest of the early Renaissance in Italy, since it preserved the vital power of expression; that it "eventually degenerated into something like formal copyism and died in affectation . . . is an indication that a style which ceases to conform to the spirit and requirements of the age is foredoomed and suppressed by a natural law."

It is most interesting to follow the reasoning which leads Mr. Anderson to assign to Brunelleschi the leadership of the Renaissance movement, he admits that the sculptors of the fourteenth century, headed by Nicholo and Andrea Pisano, had carefully studied classical sculpture, "the influence of which in Italy they could scarcely escape had they even desired to do so." He goes even so far as to admit that the Art traditions of the middle ages, such as they were in Italy, may have been broken by the departure of Nicholo Pisano, and he says "if merely a rebuild of interest, a clearer insight into Nature is understood, then we may cheerfully yield to the sculptors the credit of the origin of the movement; if besides this we understand it to include (as Architects always have done) the tendency to the revival of classic forms and principles, then the Architectural demarcation is correct which dates the Renaissance from the beginning of Brunelleschi's time and labours. He says, "the Church of San Lorenzo and the Palazzo Rucellai at Florence dealt the death blow to Gothic Art." There is of course no doubt of the tendency of Brunelleschi towards classic detail, but at the same time one is not convinced that his work can be defined as making a real revival. Take for instance the very typical door in cloister of Santa Croce at Florence, this is surely as unlike any ancient Roman work as the pulpits and ambos of the Pisano; both are strongly individual, there is nothing slavish or literal about them,

DOOR IN CLOISTER OF SANTA CROCE,  
FLORENCE. BRUNELLESCHI, ARCHITECT.

they are essentially Gothic in their freedom. With the Palazzo Rucellai it is different, it is a decided effort to tender classical work

correctly, but this is by Albrito, and with all deference to Mr. Anderson, it is to him one is induced to ascribe the real initiation of the Renaissance movement—not only by his practice but far more influentially by his

PAL. RUCELLAI, FLORENCE. ALBERTI,  
ARCHITECT.

teaching. "His ten books, *Re' Edificatoria*, were, for centuries, looked upon as the foundation of all that had been written about Architecture or building," he was the first who seems to have devoted himself to the subject from the scholars point of view, "he was the first who seriously attempted the veneration of Roman Architecture as distinct from Roman principles." Unlike Brunelleschi, he was an Archaeologist rather than an Artist, of refined taste certainly, but, still a pedant, insisting before all on an accurate reproduction of the old work, it is this effort before all to reproduce the ancient work which seems to have been so essential a condition of the Renaissance, and one cannot help ascribing the most powerful influence to Albrito's book. It may even have influenced Brunelleschi in his later days, and quite well accounts for the much greater closeness to Roman Art of Bramante's earliest work—Santa Maria, near San Latin, Milan, for example. This point will always remain a favourite one, for argument, since it can never be definitely settled, but must be left to the individual bias of those who enquire into it; it is moreover not so very important. It is more interesting to note how slowly Brunelleschi influenced the local tradition of the craftsmen who worked under his direction. Take, for example, the capital from the Pizzi chapel. It is not to be supposed that Brunelleschi carved this with his own hands, or, that the Florentine carver who did it was not technically skilful; yet the result is only an approximation to the original classical capital which the master had studied. An extremely interesting point which is drawn into notice is the divergence of the style of work produced by these Italian artists accordingly as their strongest bent was towards Painting, Sculpture, or Architecture itself. Compare, for instance, the lower part of the Certosa at Paiza by Borgognone, a painter, the ante-room of the sacristy of Santo Spirito by Andrea di Sansitino, a sculptor, and the work of their contemporary Bramante. On the other hand, Mr. Anderson proudly chooses as a frontispiece the reproduction of the magnificent fresco by Penizzi, who was before all things an Architect. It is another illustration of the famous paradox—that the world knows nothing of its greatest men—to see that the now little noticed Baldessare Penizzi was by common consent (to quote literally a French writer) placed at the head of such men as Sanzallo, Michelangelo, and Raphaello, because of his genius and talents, and the degree to which he contributed to the glory of the age; but the modesty of his character and his lack of

\* "The Architecture of the Renaissance in Italy," a general view for the use of students and others, by William J. Anderson, A.R.I.B.A., with fifty-four colotype and other plates. B. T. Batsford, 94, High Holborn, London.

PAL. ALBERGATI, BOLOGNA. PERUZZI,  
ARCHITECT.

ambition have robbed him of these honours, and his merits, appreciated alone by artists, repose almost without fame. As Mr. Anderson says: "it is his work which gives character to the culminating period. . . . To enumerate his special characteristics is to enumerate all the qualities which give distinction to the highest development of the movement. . . . Penizzi's works are notable for their simplicity, breadth, beauty of proportion, the delicacy and purity of the moulding profiles, and the ingenuity displayed in every detail, nothing being executed at hazard . . . never startling by crudities or eccentricities." This is a fine epitaph to have written 350 years after death, and no more could be said for the greatest Architect of any age or country.

Mr. Anderson is in the introduction a little severe on English writers for referring, as they certainly do, almost exclusively, to the work of the later Decadent masters, Palladio and Vignola. They do so for this reason, that, though there are scattered about England a considerable number of examples of Renaissance in feeling, and showing much of the vigour of the early Italian masters, Bramante and Michelozzi, these were invariably done by foreigners like John of Padua, surveyor to Queen Elizabeth. The first English master, the man who stands out as the leader of the Renaissance, as we know it in England, was Inigo Jones, and he was a follower of Palladio, and looked to him for guidance, and from him learned his methods, and it is quite natural that Palladio, who instructed our leaders, and who did so much to shape the method of our version of the Renaissance, should be regarded by writers on the period for English readers as the most representative and important originator of the movement. The fact is that there is a vast gulf between the conditions which produced the Renaissance in Italy and the Renaissance in England, and we may say the rest of Europe outside Italy. There was in England no gradual welding of classical detail upon an earlier tradition, the English Architects took the prescription ready dispensed from their Italian doctors, and there is no doubt would have seen little to admire in the work of Brunelleschi and Bramante, as they showed little sympathy for, and paid little heed to, the principles which guided those earlier masters.

There is this further and most important factor to be considered in estimating the value of the two movements, there remained above-ground in England probably no single example of classical work, not a forum, not a temple, not even a column, all the precedents had to be imported; whereas, as Mr. Anderson shows us, Brunelleschi had merely to travel from Florence to Rome, some 200 miles, to come upon a perfect storehouse of classical design; indeed, it seems quite probable that the studies

which he made then were suggested by the sight of the buildings themselves, and that he did not travel south for the express purpose of making them.

The chapters in which Mr. Anderson deals with the culminating period up to the death of Penizzo are especially interesting, and even the better-known Decadent period, from Palladio onwards, has great freshness given it, both by the reference to the lesser-known masters, like Alessi, and the admirable examples chosen for illustration; indeed, one cannot too highly congratulate the author or the publisher on the excellence of the plates, and the taste and judgment with which they are selected, or their almost lavish profusion (a few are here, by permission, reproduced). One interesting innovation, as far as one knows, is that of assigning a scale to a photogravure, like that of the south doorway of the Cathedral, Como. This is a book to be in the possession of all interested in the Art of Architecture, whether professionals or laymen.

The Mayor of Plymouth has announced that the decision arrived at by the Council, that the commemoration of the Queen's Diamond Jubilee should take the form of an Art Gallery and Museum, had been supported in a very gratifying manner. A sum of £1400 has already been promised.

#### NEW CHAPEL AT LEEDS.

A SCHEME for the improvement of Oxford Place Chapel, Leeds, and for the erection of a new Sunday-school and lecture hall, has been launched. The laying of the foundation-stones of the new school and the memorial-stone of the chapel front took place a few days ago. The new buildings will bear no resemblance to the existing bald-looking structure, but will harmonise with the Town Hall, in the immediate vicinity. The low situation, as compared with the artificially raised ground upon which the Town Hall is built, presented a serious difficulty to the joint Architects, Mr. George F. Danby and Mr. William H. Thorp. If funds had permitted of the erection of an entirely new structure, the chapel building would have been raised to a considerable height, with the floor elevated on a basement stage; but designs with this object in view had to be abandoned on account of the extra cost. The Architects, however, have minimised the disadvantage of the lowness of the site. The old boundary wall and entrance gates will be swept away, the ground floor raised fifteen inches, and a flight of steps will be constructed across the whole of the chapel front, giving access to the principal entrance porch in the centre of the façade, and also to the two side entrances. The building will be carried up to an additional height of about 24ft. from the main cornice level by means

of a central pedimented gable, and cupolas at either side, crowning corner pavilions. The leading features of the front will consist of a rusticated ground-floor stage, with piers, banded alternately with brick and stone ashlar work, marking the angles of the corner pavilions and the central gable; a bold projecting central porch, with a segmental arched canopy carried on rusticated piers, and coupled Ionic columns; and two square-headed side entrances, with circular fan-lights and carved spandrels. The upper first floor stage will be embellished by coupled and single columns, with richly carved composite capitals of a Renaissance character, carrying a bold, well-moulded entablature, with a projecting cornice displaying modillions. A three-light window in the central gable will be surmounted above the cornice level by a moulded, rusticated arch, the tympanum of which will be filled in with a moulded circular light and carved side panels. The cupolas, crowning the angle pavilions, and flanking the central gable, will spring from angle pedestals, with carved scroll terminals, and will have semi-circular arched faces, with angle columns, capped by moulded cornices and with stone dome-shaped roofs. The synod hall, or lecture hall, which will be brought up to the frontage line, will be connected with the principal front by means of a quadrant. A tower about 110ft. in height will form a leading feature in the block. On the plan it is square-shaped, up to the top of the stage immediately above the eaves of the main building, with rusticated angle piers and carved scroll terminals, and it is then surmounted by an octagonal belfry stage with open arcaded sides, carrying an ogee-shaped, domical roof. A treatment similar to that of the central gable of the chapel will be employed at the gable end of the lecture hall. The Park Lane elevation of the chapel will be re-faced with brick and stone work, and its present monotonous uniformity will be relieved by a pavilion at the south-west angle, with a lead-domed roof and two projecting central bays, with rusticated pilasters carrying moulded cornices and pedimented gables. The window openings will be adorned by stone moulded architraves and archivolts. In their designs for the chapel and synod hall, the Architects have, in the main, adopted the Italian Renaissance style, and they have aimed at securing picturesque grouping, combined with bold relief. The new Sunday-school building, fronting to Oxford Row, is designed to harmonise with the chapel renovation, but its design is of a more domestic type. The principal block, with high pitched roof over the large schoolroom, will have gables at either end, with moulded carved sides and pediments, and two small gables in the centre of the front to relieve the eaves line. The first floor stage will be treated with rusticated projecting pilasters. When completed the school, which is to be lighted by electricity, will accommodate 660 children. Internally the buildings will be fitted with all modern conveniences and appurtenances. It is estimated that the total cost of the alterations and extensions will be £18,000. Of this sum nearly £10,000 has already been raised.

THE work done by Mr. J. Price, the contractor for the new docks at Portsmouth, Nos. 14 and 15, which were accepted by the Admiralty on January 13th, is so satisfactory that he has obtained a contract for the new north railway jetty, at a cost of about £8000. It is to be completed in about eight months, and the new electric shop is to be finished somewhere near the same time.

THE Secretary of State for Foreign Affairs has received a dispatch from H.M. Consul-General at Christiania, stating that tenders are invited for the delivery to the Municipality of Stavanger of a certain number of gas, water, and drain pipes. Tenders for the above must be received at the Stavanger State Engineer's Office by April 1st next. Such further particulars as have been received may be seen at the Commercial Department of the Foreign Office any day between the hours of eleven a.m. and six p.m.

## EIGHTEENTH CENTURY WORK.\*

By J. A. GOTCH.

(Continued from page 93.)

MR. J. A. BRYDON opened the discussion by proposing a vote of thanks to Mr. Gotch. If eighteenth century writers and speakers had any distinguishing characteristic, he said, it was a gift for satire, and Mr. Gotch's paper was full of satire. To properly understand the houses and the homeliness of the people of the eighteenth century, they must project themselves back into the life of the people of the period. When they studied the tendencies of the age they found a great seeking after magnificence which had to be expressed in the houses of the great, who lived in a state in which the nobles of the present day would be very uncomfortable. The first thing the nobles of the land wanted in the eighteenth century was not a home—it was a palace. The disposition of plans was governed by this desire for magnificence, and although objection might be taken on the ground of utility and convenience, it certainly could not be denied that the plans achieved their aim. With the advent of the middle-class, in the eighteenth century, came the desire for a comfortable house to live in, much smaller than the palaces of the nobles—and if there was one thing more than another characteristic of this class of house it was its homeliness and comfort. They could not help feeling this very strongly whenever they were in a good eighteenth century country house. And not only were they comfortable; they were models of proportion, both internally and externally. As to adapting houses to their surroundings, the effort was long-continued before it culminated in the lovely gardens they had just seen on the screen. The admirable wood work, iron work and plaster work to be seen in eighteenth century houses was another point worth mentioning; they were studies in Design and also in good workmanship, and whether wood work, iron work or plaster work, they saw the work of the master-hand. Formerly, no gentleman's education was considered as complete without he had more than a smattering of Art and often Architecture, and he believed that if greater knowledge of Artistic matters were required to-day, the result would be better Architecture.—Mr. E. W. Mountford, in seconding the vote of thanks, thought Mr. Gotch's paper was one of the most interesting he had ever heard. He was more inclined to fall in with the views of Mr. Gotch than those of Mr. Brydon, though he agreed with the latter in his remarks about the great air of comfort surrounding the smaller houses of the eighteenth century as against the palatial buildings of nobles. The houses were very beautiful and very well planned as a general rule, but towards the end of the century matters began to go rather wrong, and culminated in the beginning of the present century in the worst form of classic Art the mind could conceive.—Mr. Henry Lovegrove, in continuing the discussion, remarked upon the excellent description of joinery work introduced into the smaller houses of the eighteenth century, but what struck him most, he said, was the smallness of the rooms. The front room on the ground floor was usually very small for a dining or a drawing-room, and in the back room a large portion of the space was taken up by an angle fireplace. He agreed that the plaster work was especially good; whether they could always admire the design or not, they could not but commend the workmanship. During the days of their pupilship they were not allowed to study the subject of eighteenth century work. They were told that it was not the Architecture of the present century, and certainly in criticising the work they ought to remember that Architects thought it was the right thing to follow the Roman manner.—Mr. Hampden W. Pratt said the middle-class of the eighteenth century did not attempt to

ape the nobles in the palatial style of their buildings, but now-a-days there was a tendency to copy the better style of houses in our smaller dwellings, and he thought it would be well if they took a leaf out of the eighteenth century book in this respect. One could not help feeling that the great buildings of last century, no matter how much they might be called theatrical in their style, were the work of masters in planning and grouping. But they could not appreciate the effect of this planning and grouping of last century mansions unless they went up in a balloon for a bird's-eye view.—Mr. E. Howley Sim asked Mr. Gotch if he could give the date of the first sash window, which seemed to him to mark a very important epoch in Architectural style. Eighteenth century Architecture seemed to have embodied all the characteristics of the time; they were not people in a hurry like ourselves, and absolute convenience was not so essential as it was to-day. He did not think the style was one which should be produced to any extent nowadays. It seemed to have been admirably suited to the people of that time, but he did not think it expressed the wants and feelings of the present day. Mr. Gotch, in replying to his question, might also tell them what he knew of the earliest example of Mitre mouldings.—The Chairman (Mr. W. H. Seth-Smith) spoke of one or two typical examples of eighteenth century work of which he was well acquainted, and remarked that to-day we had a perfect knowledge as to what was necessary to produce perfect Architecture of the present and of the future. A friend told him the other day that an Architect he had employed to build his house was "a perfect genius," and asked for his reasons which had led him to form such an opinion, said the Architect was a perfect genius because he had made the house equally beautiful on every side. And it was by such words that they would teach the public to appreciate their Art; if they displayed that care and practical convenience which Mr. Gotch had insisted on they meet the requirements of this age.—In replying, Mr. Gotch said that it struck him since writing his paper that he had not done justice to the eighteenth century. He had dealt with one aspect—the aspect which seemed to him to be the most characteristic of the age. And whatever might be said as to the treatment of Architecture, he had always maintained, and would always maintain, that its bed-rock was utility. It was no use going to him with a good drawing, and saying, "Here is a beautiful house;" it was a failure unless it fulfilled the purposes of a house. To be a work of Art, a thing, in his opinion, must fulfil the purposes for which it was designed. And these mansions of the great—if they said they were palaces only intended for show and not for dwelling, he agreed that they were very good, but as dwellings they were failures, and were considered failures by those who lived in the time they were built and were influenced by the same conditions. He could not give any definite information as to the date of the first sash window, but he thought it made its advent in Charles II.'s time—about 1675—and Mitre mouldings preceded it by fifty years.—The next meeting of the Association will be held next Friday, when Mr. T. G. Jackson, R.A., will read a paper on "Architecture in Relation to the Crafts."

By dint of untiring effort, the committee formed to secure Fortune Green as an open space for Hampstead has succeeded in its endeavours, and the site has been saved.

A SERIOUS outbreak of fire recently occurred on premises in Warren Lane, Woolwich, occupied by Messrs. Kirk and Randall, builders. Serious damage was done, a store-room being entirely gutted and the whole of the stock suffered.

CARDINAL VAUGHAN has laid the foundation-stone of a home for factory and working girls, to be conducted by the Sisters of Marie Auxiliatrice, whose present premises, at 24, Bow Road, E., are insufficient for their extending work. The new home will adjoin the existing one, and will cost £6,000.

\* Discussion on the paper read by Mr. Gotch before the Architectural Association.

## THE DOMUS OR VILLA AT WHITTON.

MR. HAMLET WATLING says that the finding recently of a Romano-British tessellated pavement at Whitton has opened a new and interesting chapter for the historian, archaeologist, and antiquary. Interesting as being on the ancient military route through Icen of our early British Queen, Boadicea, and her unfortunate husband, Prasulagus, who died at the point of time when his services were most required in assisting to drive out of the province the Roman invaders. Leaving the early history of this British trackway, we now come to that of the Romans, who evidently, from the vast remains of theirs being found upon it, made use of it for military purposes from the overthrow of the Britons A.D. 58 till the time of Antoninus Pius A.D. 138, when a more direct route to the Venta Icenorum from Camolodunum was so desirable that the heart of the province might be traversed by their legends. Coins of Antoninus, Marcus Aurelius, 161; Severus, 193; Tetricus, 267; Maximian, 286; have been found on various sites on this road; also coins of Constantius, 304—Constantine the Great, son of Constantius and Helena, born at York A.D. 274. Constantine was deeply and reverently attached to his mother. He caused her to be proclaimed Augusta, or Empress, in his armies, and through all the provinces of his empire. Medals were struck in her honour, in which she is called "Flavia Julia Helena." The town of Colchester—alleged to be named after her father, Coli, or Coel—has for ages boasted that it was the birthplace of this great Empress, and the inhabitants, to testify their veneration for her memory, take the following coat of arms of the town in remembrance of the cross which she discovered—a serrated or Raguly cross between four crowns (which is correct), not three crowns, the third being debruised upon the lower limb of the cross, the cross being a Roman one. How strange it is that Colchester, like Ipswich, should continue to cherish such palpable errors. With the above, coins of the Constantine family, and Romulus, down to the departure of the Romans from Britain, have been found at Whitton. So the villa must have survived till the inroad of the Saxons, who burnt and plundered wherever they went. This is visible upon every spot excavated, which the abundance of charcoal fully testifies. The beautiful household fittilia, as the Samian ware, Salopian, &c., the tessellated pavements, and even the foundations, were rooted up by their barbarous animosity, fragments of which are scattered about on all sides and mixed with the débris that is turned up. When the tessellated pavement, which is now in the Ipswich Museum, was raised from its position in the Peristylum, why were not the tiles, bricks, pottery (although in fragments), and coins, as well as those of the animals, preserved, especially those of the Bos Longiferous, a species of ox now extinct, but which, in the time of the Romans, must have been very plentiful, as well as those of the sheep, hog, horse, deer, wolf, &c.? It appears the transaction of removing the pavement was a barbarous one, especially when the affair was under the superintendence of an Architect who professed to be an archaeologist. The inscription beneath a drawing by Davy runs thus:—"Roman tessellated pavement, discovered December, 1854, in the Castle Field, St. Matthew's, Ipswich, Suffolk, the property of John Orford, Esq., and by him presented to the Ipswich Museum, and deposited there March 16th, 1855, under the superintendence of Mr. R. M. Phipson, Architect, and Mr. F. Mansome, &c." To effectually investigate the site would be to draw a trench four feet wide intersecting the foundations at a right angle, and thus the walls of the foundation might be easily traced.

It is stated that Lord Sudely has sold Toddington, his domain in Gloucestershire, subject to his life interest and that of his elder son. The mansion, which cost £200,000 to build, is famous for its beautiful stained glass. The estate extends over 7000 acres. The purchaser is Mr. E. T. Hooley.

## LONDON CHURCH ARCHITECTURE OF THE VICTORIAN ERA.\*

BY T. FRANCIS BUMPUS.

Author of "London Churches Ancient and Modern," "Ecclesiological Notes from North Germany," &c.

THE subject upon which I have been invited to speak to you this evening is one of great, I may say, inexhaustible interest, whether we regard it from the standpoint of churchmen, Architects, or amateur ecclesiologists. To the student of modern English Church history some knowledge of the Architecture and dates of erection of the Churches raised, not in London alone, but all over the country, within the last sixty years, will be found both pleasant and useful; for, when the religious history of the century comes to be written, that of the numerous magnificent Churches which have marked the course of the great religious revival will be indissolubly bound up in it. In bringing the modern Churches of London—many of which are doubtless known to you, either from reputation or actual inspection—before your notice, I shall endeavour, as far as possible to introduce them to you in chronological order. This rule, it will be found necessary in some instances to contravene, for it may happen that, in some parishes where the ecclesiological movement has made itself felt more strongly than in others, several Churches may exist which, although erected at different times, may, for our convenience sake, be grouped together and contrasted. Again, two Churches may, perhaps, have been built by the same Architect in different parts of the town; these, then, regardless of date, will be compared, and their various divergencies pointed out. Then it may be necessary when touching upon the redecoration and recasting of a debased or inferior Church in the East of London to refer to another which has undergone similar ameliorations in the North, West, or South. Indeed, a subject of this kind has so many ramifications, and presents so many aspects, that it behoves me to enter upon it without further preamble. It will, however, be necessary for us first to take a glance at the history of the revival of the true principles of Ecclesiastical Art and consider how it was brought about. Although the English Gothic style began to lose its purity about the reign of Edward IV., yet the additions to and embellishment of Cathedrals, Churches, Colleges, and conventual buildings was carried on with unabated vigour until the Reformation, when it received a sudden and decided check from which it was very slow in recovering. But although the Pointed styles, after a struggle with the Classical, became extinct before the middle of the seventeenth century, there has been no period since the Reformation, even during those eras of classicism, the Stuart and Hanoverian periods, in which constructions, either partially in the spirit of Gothic Architecture, or reproducing some of its details, have not been erected. Love for old Pointed Art never died out in England, even the absurdities of Strawberry Hill attest this; while a glance through volumes of "The Gentleman's Magazine"—almost the only periodical in which the Arts were represented during the last, and early part of the present century, registering as it did all the metropolitan improvements, describing the new Churches, and chronicling Archaeological discoveries—is sufficient to show that, while the descriptions too frequently betray an ignorance of technicalities, they are spiritedly penned, and did an immense deal of good towards keeping alive the love for old English Architecture.

## DAWN OF THE GOTHIC REVIVAL.

There are several writers of the end of the last century to whom we owe a debt of gratitude, sowing as they did those seeds of the great Gothic Revival of which at the present day we are reaping the fruits. I refer to Warton, Bishop Milner, and John Carter. Much of its progress, too, must be traced to the writings of Sir Walter Scott, whose truthful

\* A paper recently read before the Toynbee Architectural Society.

and accurate portrayal of mediæval manners and customs has won for him a higher praise from posterity than has fallen to the lot of any literary man. Britton's magnificent series of "Cathedrals" and "Architectural Antiquities," the writings and drawings of The Elder Pugin, Dawson-Turner, Cotman, and Wild, upon and of the buildings of France, must not be forgotten, although their publication, while serving to increase the widely spreading knowledge upon Architectural subjects, was of little practical use, for Churches were being built in London and provincial towns during the teens of the present century, anyhow or nohow, it mattered little, so long as they were occupied.

## THE COMMISSIONERS' CHURCHES.

Then came the "Million Act" of 1818, and the erection all over England of Churches, many of them well-intentioned and liberal in their cost, but sadly travestying the Grecian and Gothic styles which their Architects sought to reproduce in them.\* Of the Churches aiming at pure Hellenism of style, St. Pancras, in the Euston Road, finished in 1822, is the largest and most costly. Strangely unsuited, not only to the climate of our land, but to purposes of devotion, its details, although well executed, exhibit a motley collection of ill-assorted plagiarisms. Fine Doric porticos are found at Smirke's Church of West Hackney; Bedford's St. John's, Waterloo Road; and Porden's St. Matthew's, Brixton Rise, but the really excellent effect of these massive porticos is too often ruined by the steeple, which rises like a horn out of the Church's neck without any apparent basis. Among the Gothic Churches erected by the Commissioners between 1820 and 1830, St. Luke's, Chelsea, finished in 1824 with a stone-vaulted roof from the designs of Savage, together with St. Paul's, St. John's, and Holy Trinity, in the parish of Islington, all by Sir Charles Barry, deserve especial mention. While evincing in their detail and arrangements great ignorance of, or disregard for, the grammar of pointed Architecture, all these Churches—Perpendicular in style—are invested with a dignity of outline hard to find in later and more correct works of the Revival. The London Churches succeeding those of the "Million Act" show a decided retrogression. I allude to those erected between 1830 and 1846,\* chiefly under Bishop Blomfield's Metropolis Churches scheme from the plans of Blore, Clutton, and Vulliamy. Foreign, particularly German, Romanesque was the style most favoured, indeed, for a time this very protean style threatened to become the religious Architecture of England. Some infelicitous specimens exist within a very short walk of this room. I allude to such Churches as St. Andrew's and St. Philip's, Bethnal Green, and St. Peter's, Stepney. With them may be classed St. Thomas's, Charterhouse; Christ Church, Hoxton; St. Paul's, Bunhill Row; St. Philip's, Clerkenwell; and St. James', Curtain Road—structures in which all internal decency and Architectural fitness was ground down to the very dust to meet an idolised tariff of so many shillings per sitting.

\* Between 1820 and 1830 almost every London suburban parish had been provided with one of these "Commissioners' Churches." Of these Smirke erected three, i.e., West Hackney Parish Church; St. Mary, Wyndham Place; and St. Anne, Wandsworth; and each has an interior planned on the same model. The Doric pillars on the galleries of these three Churches contrive to invest their interiors with an air of grandeur which was attained by no other of the same class, St. James, Bermondsey, perhaps excepted. The three Churches in the parish of St. Pancras, by Inwood; Bedford's Churches of St. John, Waterloo Road, and St. George, Camberwell; St. Mary's, Greenwich, by Bassevi; and St. John's, Hoxton, by Edwards, are mere galleried rooms, but they have in many cases been rendered more devotional by redistribution of their fittings, and by the introduction of painted glass and mural decoration. St. Pancras, Euston Road, and West Hackney Church are good instances of such treatment, which has likewise been resorted to in the Gothic Churches erected under the same scheme. In such specimens of "Commissioners' Gothic" as St. Mary, Haggerstone, by Nash; St. Mary, Somers Town, by Inwood; and Holy Trinity, Little Queen Street, by Bedford, the details provoke laughter. St. Philip's Stepney, since removed to make way for its magnificent early English successor, was, perhaps, next to those by Barry and Savage, the most respectable of the Gothic Churches, all of which will be found minutely described, and in many instances caustically reviewed, in "The Gentleman's Magazine," between 1820—1830.

## EARLY CHURCHES OF THE REVIVAL.

Perhaps three of the most respectable of this class of Church built in London in the foreign Romanesque style were St. Matthias's, Bethnal Green,\* the Chapel of St. Mark's, Chelsea, by Blore; Christ Church, Watney Street, St. George-in-the-East, by Shaw; and the Roman Catholic Church of St. John, Duncan Terrace, Islington, by Scoles. In St. Mark's College Chapel, Blore sought to reproduce, but on a ridiculously small scale, one of the great Rhine Churches. Christ Church, Watney Street, well worth visiting on account of the skilful manner in which it was coloured, and an apsidal sanctuary added to it from the plastic hand of Mr. James Brooks about five and twenty years ago, has a very telling and effective nave elevation.† There are two tiers of arches on short columns with scalloped capitals; the upper one opens into a sort of triforium, somewhat after the style of the German Männerchor; and above this again is a clerestory of plain round-headed windows. Shaw, the Architect of this Church in Watney Street, was the son of the designer of the Great Hall of Christ's Hospital, and of St. Dunstan's, Fleet Street, whose fine lantern tower was often pointed to by the late Mr. Street as one of the most successful London steeples. It was finished in 1833. The third Church of this Romanesque group—St. John's, Duncan Terrace, Islington—was the work of Scoles. It is chiefly remarkable for its basilican arrangement, and for the fine frescoes in its apse and side chapel by Armitage. These frescoes represent respectively, "Christ enthroned among the Apostles;" and "S. Francis of Assisi receiving the approval of Pope Innocent III. to the Rule of the Order of Franciscans." In designing this Church, Scoles was severely censured by Pugin for adopting the Romanesque style; that merciless censor, in his "Ecclesiastical Architecture," publishing a view of the old Parish Church of Islington, which he declared, not without some show of reason, ought to have formed the model for St. John's. While on the subject of Roman Catholic Churches, mention might be made of an earlier work of Scoles, the Chapel of Our Lady, Grove End Road, St. John's Wood, an Early English Church finished in 1835, in imitation of the choir of the Temple Church. It was subsequently copied at Edgbaston, near Birmingham. All these works doubtless passed at the time for very tolerable specimens of Church Architecture, and gave great satisfaction to their several promoters. But a change was at hand.

## ESTABLISHMENT OF ARCHITECTURAL SOCIETIES.

In 1838‡ The Cambridge Camden Society was formed, followed a year later by the Oxford and other Architectural Societies. Each body had for its end the dissemination of the true principles of English Church Architecture, and these various societies, coupled with the writings of Brandon, Parker, Petit, Rickman, Sharpe, and Augustus Welby Pugin—who had before 1839 built several Churches far in advance of their age—had a very large share in inculcating the Grammar of Revived English Gothic Architecture. I alluded just now to the "Cambridge Camden Society," afterwards called on its removal to London early in the "forties," the "Ecclesiological Society." While, there is no doubt, both the Cambridge and Oxford Architectural Societies did no little mischief among our old Parish Churches, by rashly depriving them, under the term "restoration," of much historic interest—I mean that of the Caroline and early Georgian periods—the Cambridge Camden Society was one of which the Church of England may well be proud. Set on foot in 1838 by two undergraduates of Trinity College, Cambridge—Benjamin Webb and John Mason Neale, both since dead—it

gradually enrolled among its members countless names celebrated in Art, Literature, Divinity and Politics. It would take me too long to give even a tithe of these names.

## PUBLICATION OF "THE ECCLESIOLOGIST."

Many merely took up the subject of Ecclesiology as a pleasant recreation. The labours of the "Ecclesiological Society" were not confined to the building of Churches alone, but extended to every department of the Art—particularly Church music. Correspondence was carried on in the pages of their organ the "Ecclesiologist," with Architectural societies both at home and abroad, and for thirty years the greatest enthusiasm prevailed. At the time of which I am now speaking—the early "forties"—the Church Architects in practice, besides those whose names I have already introduced to your notice, were: Cundy, Hakewill, Dawkes, Ferrey, Poynter, Pugin, Salvin, and Wild,\* all of whom had produced Churches which, although they showed a vast improvement in detail yet were not at all satisfactory from the "Ecclesiologists'" point of view; and they got some good hard knocks from those relentless critics. Carpenter, Butterfield, Pearson, and Street, all of whom were, before long, to attain such eminence in their profession, had done little or nothing before 1848 to bring themselves prominently before public notice, but a Church had been built between the years 1842 and 1844 very much in advance of its age, and from the designs of an Architect to whom, in but a few years, the destinies of nearly all our Cathedral fabrics were to be entrusted. The Church was St. Giles, Camberwell; the Architect, George Gilbert Scott. No Church erected at the time was considered more orthodox in its arrangement than St. Giles', Camberwell. That such a structure attracted much notice on its completion goes without saying. And it was all the more remarkable when we remember that it was erected during the life-time of a generation which had witnessed the building of those semi-Pagan structures, St. Pancras, All Souls', Langham Place, West Hackney, and Holy Trinity, New Road. Refreshing, too, were its plan—cruciform, and its style—Early Middle Pointed—the latter highly so, after the miserable travesties of Romanesque, Early English, and Perpendicular, which were being sown broadcast all over the country from the hands of clumsy, incompetent Architects and ignorant building committees. Fifty years of London Church building has, I venture to say, failed to produce a steeple so well proportioned and so graceful as the central one of St. Giles', Camberwell. Rising as it does at the intersection of the neat, compact plan, it assists in investing the exterior of the Church, especially when viewed from the north-east, with an air of charm and dignity which few Architects of the Revival have succeeded in rivalling. Internally, Camberwell Church—which, I should have premised, replaces a mediæval building burnt down on Sunday, Feb. 7th, 1841—is extremely solemn and devotional, despite the galleries which, by an unfortunate necessity, were thrust into the nave aisles; while the fine effect produced at the crossing beneath the tower, and the tracery of its deep chancel windows, look, to the unpractised eye, the work of a mediæval Architect.

## WORKS OF SCOTT, FERREY, CARPENTER, BUTTERFIELD, AND PUGIN.

There is so much ground to be got over tonight that I am unable to dilate at any length upon this or any other Churches which I shall have to present to your notice. I hope, however, that you will be persuaded to visit them for yourselves, aided in however humble a degree by the brief notes I shall offer you upon them. The greater number of the Churches erected in London between 1845 and 1855 are reproductions of old examples. Thus, the magnificent parish Church of South Hackney†

has a tower and spire, an almost absolute copy of that of St. Mary, Stamford, while the inner plane of tracery to the clerestory windows, and the trefoiled arcading round the apse, are manifestly features borrowed from Stone Church near Dartford—one of the loveliest buildings of its size in the later Early English style that we possess, and said, by Mr. Street, not without some show of reason, to have been built by the same Architect as Westminster Abbey. Again, at St. Matthew's, City-road,\* the steeple is built on the model of that at Sutton St. Mary, Lincolnshire, one of a glorious line of Parish Churches—the finest, perhaps, that Northern Europe can show—extending from Sleaford, in Lincolnshire, to King's Lynn, in Norfolk. At Sutton St. Mary, where the steeple stands detached from the Church, the spire is of lead, a rare and curious instance of the employment of that material on so large a scale; at St. Matthew's the spire—identical in outline with the Lincolnshire example—is of stone, and, I must confess, far more elegant. Although hardly realising the idea of what a town Church should be in such a thoroughfare as the City Road—lacking height—St. Matthew's has many excellent points of detail. The painted glass in the aisle windows, by O'Connor, inserted nearly twenty years after the completion of the Church in 1848, is of rare excellence; while the elegant quintuplet of lancets which lights the east end is a copy of that in the Early English chancel of Chetwode Church, near Sir G. G. Scott's birthplace—Gawcott—in Buckinghamshire. A few brief notes upon some other Churches belonging to this first or "copying" phase of the Gothic Revival must be given, before introducing you to those of its second and still more important one. All these Churches are replete with interest, and, as I remarked at the outset, will have no little share in the religious history of the century when it comes to be written. I was speaking to you of the manner in which details from old English buildings were applied to modern Churches, so will resume with St. Paul's, Knightsbridge, whose western pinnacled tower is modelled on one of those at York Minster. It is very pleasing; far more so than the nave, which is but a large pillarless expanse, galleried on three sides, but rendered devotional by the stained glass which fills all its windows. A very imposing chancel, with rood-screen and reredos, has lately been added to this nave from the designs of Bodley and Garner. It however, stands in need of polychromatic decoration, its whiteness contrasting rather startlingly with the gorgeous little Chapel of St. Luke's, which abuts on its south side. Other very tolerable copies of old English examples are—Christ Church, Endell Street, by Ferrey; St. Paul's, Camden Road, by Ordish and Johnston; St. Matthew's, Oakley Square, by the latter Architect; Christ Church, Ealing, by Scott; Holy Trinity, Havestock Hill, by Wyatt and Brandon; and St. Mary, Lambeth, by Hardwick; but we shall not linger over these as I have to introduce several more interesting and important ones, to you.

## EARLY CHURCHES OF THE "TRACTARIAN MOVEMENT."

There are five of these Churches, each illustrating a distinct period of English pointed Gothic; each exhibiting in its arrangements a complete illustration of the ritualism of the Prayer Book; and most of them instances of splendid individual munificence. Taking them in order of date we have first St. Andrew's, Wells Street, finished in 1847 from the designs of Dawkes, and presenting us with an admirable instance of what an Architect can do when he has to deal with an awkward site. In this case the Architect had at his disposal a broad plot of ground lying between houses; taking as his model one of those lofty Perpendicular Churches in which cities like Norwich, Bristol, and York, are so rich, he erected upon it a Church with a broad but lofty clerestoried nave and chancel under one continuous roof, very wide aisles, and a steeple engaged at the extreme north-west angle. In style St. Andrew, Wells Street, is Early

\* Sir G. G. Scott's first strictly London Church.

\* A modest reproduction of the costly Byzantine Church, built by the same Architect—Wyatt—a few years previously at Wilton.

† In no London Church of its date has the *venusta questio* of galleries been more successfully grappled with.

‡ Three years later the Cambridge Society issued the first number of its organ, "The Ecclesiologist," an invaluable little quarterly, which ran on until 1868.

\* A highly creditable Church was erected at Streatham Hill in 1841 from the designs of Wild in the Early Pointed style of North Italy, which was much praised in the "Gentleman's Magazine" for November of that year.

† Finished in 1848 from the designs of Mr. E. C. Hakewill, and erected mainly through the exertion of the Rector, Rev. H. H. Norris. The Apse windows contain some of the best stained glass inserted at the time by Walses.

Perpendicular, and perhaps the best Church erected at the time in that style; while ritually considered it was a great gain to Art, and with its free and open seats, raised chancel, with stalls and fold-stool, its double daily service, and correct ritual, has long been considered a model Church. It is particularly interesting from the fact that it became in 1862 the cure of Rev. Benjamin Webb, one of the founders of the Cambridge Camden Society, who, between that period and the year of his death, 1885, spared no pains to render its interior, as far as the confined space would permit, the most artistically interesting in London, for it contains specimens of the work of all the great practitioners of the Revival except Sir G. G. Scott. To Pugin is due the drawing of the east window; Street re-arranged the chancel, and designed the magnificent reredos which extends up the wall on either side of the east window, besides occupying the customary place beneath it; Burges designed the tomb to a former incumbent, Rev. Jas. Murray; Bodley decorated the sacristies; Seddon furnished the designs for many of the altar frontals; to Pearson are due the sedilia, a memorial to Mr. Webb; while from the atelier of Clayton and Bell issued the delicate paintings on the gallery fronts and most of the painted glass.

#### SOME SPLENDID INSTANCES OF INDIVIDUAL MUNIFICENCE.

St. Barnabas', Pimlico, finished three years later than St. Andrew's, is the most creditable production of its Architect, Mr. T. Cundy. It was confessed, on its completion, to be a model of excellence; indeed, it was the most sumptuous and most correctly fitted Church erected in England since the Reformation. Raised at the time of the Papal Aggression in 1850, when any advance towards an improved ritual was regarded by the majority with intense suspicion, the Church and its furniture formed the subject of much litigation; riots ensued, and for some time the building was in danger of being sacked by mobs who, Sunday after Sunday, assembled to hoot, groan, and interrupt the services to such a degree that, had it not been for the intrepidity of the officials and clergy, they would have entirely set aside the right to undisturbed worship. St. Barnabas' is not a town Church, and this is the side on which it errs, but its detail evinces careful study. Indeed, to look really well, it should be removed from the contamination of smoke, being an almost absolute copy of an early English country Church. Its plain broach spire surmounting a well-proportioned tower on the north side of the west front\* is truly graceful, and the small court on the south side, surrounded by the Church and College for Clergy, with its cross opposite the porch is exceedingly picturesque, forming at the time of its erection a novelty in Ecclesiastical Design. There are not many London Churches whose interiors can be pronounced truly pictorial; but this of St. Barnabas—where all the windows are filled with stained glass by Wailes—seen under certain conditions of sunset; or, as it appears on festivals, when its chancel is illuminated only by candles, is strikingly impressive. Although enriched with polychromy from time to time, few structural changes have been effected in the interior of this beautiful little model Church. A handsome reredos, in the Late Decorated style, has, however, been added within the last three or four years, from Bodley and Garner's Designs, and the organ has received a case in the same style. Less ritually, but, perhaps, more Architecturally correct than St. Barnabas', is the second Church of this group—St. Stephen, Rochester Row, Westminster, built at the sole cost of Baroness Burdett-Coutts, from the designs of Ferrey. Like St. Barnabas', "free for ever to Christ's poor," it was consecrated only twelve days later in the same month of the memorable year 1850, its design calling forth the highest encomiums from the Architect, the ecclesiologist, and the amateur. One of those grand Late Decorated Lincolnshire Churches seems to have furnished Mr. Ferrey

with the model, but it has the same fault as St. Barnabas—insufficient height for a town Church. At the east end of the north aisle rises the tower, very fine and massive; but the spire which surmounts it is rather too acute, and its contour viewed at a little distance is not pleasing. Inside, the arcade of the nave, with its delicate clustering shafts, should be especially noticed, while the carving of their capitals is certainly unsurpassed by any contemporary work of the kind. A remarkably good reproduction of a town Church of the thirteenth century is St. Mary Magdalene, Munster Square, the fourth Church of this series. Partially finished in 1852, it must be considered the noblest conception of its Architect, Richard Carpenter (1812-1855)—one of the earliest, ablest, and most zealous of the ecclesiologists. Until 1884 St. Mary Magdalene's consisted only of the nave, chancel, and south aisle; but even in that state its internal appearance was one of the deepest solemnity and impressiveness—an effect derived from the noble sentiment which must have pervaded the mind of its designer; from the stonework, which five and thirty years had mellowed, and from the stained glass, with which all the windows were filled. Eleven years ago the north aisle was added as a memorial to the Church's revered co-founder, Rev. E. A. Stuart, but the tower and spire which Carpenter designed to be engaged at the south-west angle have yet to be reared. The interior of St. Mary Magdalene, Munster Square, is, to my mind, the beau ideal of a well-arranged town Church, from which the clerestory is absent, with its light, graceful arcades, its spacious aisles, deep chancel, and unencumbered area. The "motif" was the Dutch Church in Austin Friars, the style Geometrical, melting in the chancel into the Flowing Decorated. The east window of St. Mary Magdalene's is, for the period of its insertion, undoubtedly the most magnificent in the kingdom, both as regards its tracery and the painted glass which fills it. The latter was designed by Pugin and executed by Hardman, to whom are due the not quite so successful windows on the south side of the sanctuary and at the east end of the south aisle. I may also point to the great west window, an early work of Clayton and Bell's, and forming a memorial to the Architect, whose untimely death in 1855—three years after the completion of the Church—deprived the Church of England of one of her most promising Architects. I know nothing more beautiful than the interior of St. Mary Magdalene's, Munster Square, during a fine sunset, when the rich glow, streaming through the western painted windows, leaving the further end of the Church in shade, is deeply impressive.

#### PEARSON'S FIRST LONDON CHURCH.

It is singular that two of the most eminent Archaeologists of the century in England and France—Sir G. G. Scott and M. Didron—should have fixed upon the fifth Church of this group, Holy Trinity, Bessboro' Gardens, Westminster, as embodying the idea of an English Fourteenth Century Church in its greatest completeness. Viewed from the west end of Vauxhall Bridge, its central tower and spire; its chancel, lighted by a noble seven-light window, and having on its north side a cleverly-contrived gabled sacristy, help to compose a truly charming picture. Finished in 1852 from the designs of Mr. Pearson, whose earliest London work it is, Holy Trinity, Vauxhall, is another of those instances of wealth ungrudgingly bestowed to make the Lord's house beautiful. It was built and endowed at the sole cost of the late Archdeacon Bentinck. On the same day that Holy Trinity was founded, another Church in Westminster, but in a squalid district of it, was begun—that of St. Matthew, Great Peter Street,\* a spacious and pleasing, but not otherwise remarkable structure, in Early Decorated, from the designs of Scott, and recently enriched by the erection of an effective rood-screen, with crucifix and attendant figures.

I mentioned just now that Holy Trinity Church, Westminster, was a typical Church of the first phase of the Gothic Revival, viz., that of absolute copyism. Ten years later another Church at the opposite end of Vauxhall Bridge was rising from the pencil of the same Architect—Mr. Pearson—the very antipodes of Holy Trinity, in plan, style, and everything else. It was as foreign as Holy Trinity was English; but as the Church in question—St. Peter's, Vauxhall—belongs to the second or inventive phase of the movement, it will appropriately fall into its place when describing works of a similar character.

#### ROMAN CATHOLIC CHURCHES OF LONDON, 1848-1858.

Before passing on to this very important era of the Gothic Revival, when Architects were beginning to think for themselves, and to relinquish the copying process, I must just call your attention to three very large and noble Churches erected outside the Anglo-Catholic Communion—i.e., the Roman Church of St. George, Lambeth; and the Jesuit Church, in Farm Street, Berkely Square; and the so-called Apostolic Church, in Gordon Square. St. George's, Lambeth, one of the very few Churches erected in or near London by Pugin, is, as far as its nave goes, a reproduction of the once glorious Church of the Austin Friars, near Broad Street, or, perhaps, of St. Botolph's, Boston. It cannot be pronounced a success, for here, as in all his works, Pugin was hampered by the ignorance of the clergy of the Church which he had embraced, to say nothing of pecuniary considerations. Indeed, he himself said that his professional career was passed "in thinking of fine things, designing fine things, and realising very poor ones." Perhaps the heavy appearance of the Church externally is due to the huge unfinished Western Tower, and it seems a great pity that this fine work should not have been completed as a memorial to its Architect. It is regrettable to observe that the beautiful rood-screen—the only really cathedralic feature this Church possessed—has lately been removed from its legitimate position at the entrance of the choir, and placed beneath the tower arch, as if, forsooth, this noble feature of the Church were not already choked up enough as it is by a cumbrous organ-loft. It is a most extraordinary thing that almost without exception Roman Catholic Churches should be disfigured by such glaring instances of bad taste. The Farm Street Church, finished in 1849 from the designs of Scoles, whose name was mentioned earlier in this paper in connection with a small Early English Church at St. John's Wood, is, like St. George's, in Flowing Decorated style, a period of Architecture which, it is curious to note, was adopted in nearly all the Roman Catholic Churches erected between 1850 and 1860. I refer to several very fine ones built from the designs of Wardell, at Greenwich,\* Clapham,† Poplar, and in the Commercial Road.‡ The interior of the Church in Farm Street, with its lofty clerestoried nave separated from its double south aisle by elegant clustered piers, is extremely picturesque—quite Belgian in fact, though the detail is fine, nervous, English Flowing Decorated. One of the noblest features of the Church is the great eastern window filled—as is the one in a similar position at St. George's—with painted glass by Wailes.§ An immense quantity of work was executed by this Artist, but little of it rose above mediocrity. What we miss in Wailes' windows almost without exception, is the eye of a master—a really skilful combination of colour. The Church in Gordon Square, recalling in many details some of our great northern Minsters, was the work of Brandon, whose untiring researches into the old Architecture of our land enabled him to invest it with its present imposing, albeit incomplete, air.

(To be continued).

\* St. Mary, Star of the Sea, close to the Park.

† Our Lady of Victories, on the Common.

‡ St. Mary and St. Michael, Commercial Road, E.

§ Besides Wailes, the chief stained glass painters at this period of the Revival, i.e. 1845-1855, were Willement, Hardman, O'Connor, Warrington, Ward, and Nixon.

\* Copied from an ancient example, which had also furnished the "motif" for the west front of a Church by Pugin at Stockton-on-Tees.

\* The steeple of this Church, from lack of funds, has never been completed; but even in its unfinished state it has an air of great dignity and massiveness, which one would unwillingly see disturbed.

## Bricks and Mortar.

EFFINGHAM HOUSE, ARUNDEL STREET,  
March 31st, 1897.

*"I know what it is to live in a cottage with a deal floor and roof, and a hearth of mica slate; and I know it to be in many respects healthier and happier than living between a Turkey carpet and a gilded ceiling, beside a steel grate and a polished fender. I do not say that such things have not their place and propriety; but I say this, emphatically, that the tenth part of the expense which is sacrificed in domestic vanities, if not absolutely and meaninglessly lost, in domestic discomforts and incumbrances, would, if collectively offered and wisely employed, build a marble Church for every town in England; such a Church as it should be a joy and a blessing ever to pass near in our daily ways and walks, and as it would bring the light into the eyes to see from afar, lifting its fair height above the purple crowd of humble roofs."*—JOHN RUSKIN.

THE forecast made in our columns a few weeks since as to the course the Government would probably take on the question of the sites available for public offices is being fulfilled to the letter. With the same terms of reference as those of last year a Committee of the House of Commons has been re-appointed to inquire into, and report upon, the manner in which the sites available for the erection of the new buildings required for Government offices may best be appropriated for that purpose, and will resume its sittings very shortly. And within the last few days the promised bill for the acquisition of the Carrington House site, Whitehall, has been introduced in the Commons and read a first time. It sets forth that all the land proposed to be acquired under the Act is vested in Her Majesty as part of the hereditary land revenues of the Crown subject to certain outstanding leases, estates, and interests; and it proposes to authorise the issue, out of the Consolidated Fund, of such sums not exceeding in the whole £500,000 as may be required for the payment of the consideration payable for the Crown lands in question, and for the purchase and acquisition of the leases, estates, and interests; authority being given to the Treasury to extend the payment or the repayment of the sum required over a period of not exceeding fifty years, so that the burden on the taxpayer will be comparatively light. Power to build on the site so obtained is also conferred upon the Commissioners of Works.

IMMEDIATELY after Easter another colony of working-class dwellings will be commenced on the vacant space in the rear of the new Picture Gallery at Pimlico. So far as the number of people to be provided for is concerned, this is nearly as important as the great Boundary Street Scheme, to which allusion was recently made in this column. The ground at Westminster is only eight acres, as compared with fifteen at Spitalfields, but it will eventually house 4300 people, as against about 4700 on the larger space. It is intended here also to set up a model laundry, the Council having unanimously recognised its desirability. They were a good deal divided on this project when the Boundary Street plans were laid. There were no dissentients at all when this feature was proposed for Pimlico.

THE hand of the renovator is at present engaged in removing the traces of a past age on a building in the Vault, Dundee, to which tradition has attached some historic interest. The building is situated on the west side of the Vault, and the first floor is at present being converted into a hall. The dwelling-houses above are reached by a staircase from the back, which still retains traces of former elegance in the shape of carved woodwork, and it is wider and airier than is usually found in old tenement houses. The remains of panelling are still present in the rooms, and paintings of Sir Walter Scott and Robert Burns decorate the doors of two old cupboards. The place was used as an inn during the latter

part of last century and the earlier part of the present one, and there are lingering traditions of distinguished men having lived in it. There is a story to the effect that Burns spent a night there while on a visit to his patron and friend Robert Graham, of Fintry; and Sir Walter Scott, Dr. Johnson, and even Boswell, are said to have put up there. The piece of ground now occupied by the Vault was, as is well known, at one time the churchyard surrounding St. Clement's Kirk, the oldest Church in Dundee. In Queen Mary's time this was the only burying-place in Dundee, and it was in consequence of the danger to the health of the inhabitants that that Sovereign in 1567 granted the orchard that had formerly belonged to Greyfriars' Monastery (then destroyed) as a burial place. St. Clement's Church was in a ruinous state prior to the Reformation, and, when the revenues that had been attached to it were secularised, the property in the immediate neighbourhood of the Church came into the possession of several of the leading merchants of the day. The existing building has been so frequently altered and extended that its exact date cannot readily be fixed, but the principal portion dates back to at least the beginning of the seventeenth century.

At a general meeting of the Building Trades Exchange recently held in Glasgow, a paper was read by Mr. William Oliphant on the subject "Why is Scotland Fifty Years behind in Heating and Ventilating?" Mr. Oliphant said he was not prepared to prove Scotland was really so far behind, but maintained the country was seriously behind. He had travelled extensively, and could speak from sixteen years' experience in America, where he was in the position of Consulting Engineer. All the principal establishments in America devoted to heating appliances were managed by Scotchmen, and all the inventions by Scotchmen were widely adopted. The best of the appliances were the inventions of Scotsmen. How was it, then, that Scotland should be so far behind when her own sons knew no superiors in the field of useful invention? Simply because the capitalists were slow to take a good thing when it was offered them. "Wait till to-morrow" was their cry, and to-morrow never came; whereas the Americans offered the clever Scots with brains and merchantable ideas every scope, every facility to capital, and encouragement of every kind. Consequently America to-day enjoyed what was beyond question the best heating, ventilating, and cooking appliances in the civilised world, and is indebted to her gifted Scottish citizens for most of them. Mr. Oliphant strongly advocated the adoption in Scotland of the American system of cooking and plumbing apparatus. He strongly advocated the American system of ranges for cooking on account of their cleanliness, facility for working, and economy of fuel. In America the greenhouse system of heating by a series of pipes had been abolished, and radiators were now generally adopted.

LAST week the Heath Memorial Convalescent Home at Llanfairfechan was formally opened and handed over to a committee. The site of the Home is on the Penmaenmawr Road, and about a quarter of a mile from Llanfairfechan Railway Station. The building, which is of local stone, with dressed stone facings and lined with bricks, comprises a three storied block, with a frontage of about 140ft. It contains day rooms and dormitories for the accommodation of fifty patients, with suitable offices and servants' rooms, and convenient suite of rooms for the matron. Advantage has been taken of the quick fall of the ground towards the sea to construct a basement floor, which contains a bagatelle room, the dining hall, lavatory, kitchen, scullery, larders, boot room, &c. The contents given to the dormitories vary from 750 to 1000 cubic feet for each patient, and special attention has been devoted to provide ample light and ventilation in all parts. The rooms are provided with open fireplaces, and the corridors and principal rooms are heated by low pressure hot water pipes. Hot and cold water is laid

on all over the building, bath rooms are provided on each floor, and the sanitary fittings are of most modern and approved design throughout. A gate lodge, with a wash-house and laundry connected to it by a covered way, has been built adjacent to the building. Mr. Thomas Bower, of Nantwich, Cheshire, is the Architect; and Mr. John Gallimore, of Newcastle, Staffs., the builder. The heating, ventilating, and fire appliances, have been carried out by Hadden and Sons, of Trowbridge.

THE new St. Paul's Parish Institute, Cambridge, is a substantial building with a red brick front. The plans were prepared by Mr. John Morley, Architect, and the work has been carried out by Messrs. Kerridge and Shaw at an estimated cost of some £1300. The coffee room is to the left as one enters, behind it being the kitchen, and the small hall lies to the right. The large hall is behind, communicating with the small hall by sliding doors. The jumble storeroom is entered from the large hall, or by a passage passing round the building. The class rooms and caretaker's rooms are over this front block. All the ground floor rooms are match-boarded with pitch pine, and are illuminated with incandescent light.

PROFESSOR A. S. BICKMORE, in a recent lecture on "Upper Egypt—Karnak," said the Nile harmonised the ancient world with the world of to-day. In the Temple of Luxor the columns were overburdened with their wealth of ornamentation, all of which were originally coloured, but the tints had been blurred by the smoke from the torches of guides and the camp-fires of tourists. In the rear of the temple was placed the sanctuary of the god. The avenue, formed by obelisks, sphinxes, columns, and statues, led up to this sacred spot. In the Temple of Luxor was found the famous statue of Ramses II., thought to be the finest work of Egyptian Art. It was cut from red Assuan granite. The temple at Denderah owed much of its fame to the fact that on its walls were the statues of the Cleopatra of Cæsar and Anthony, and her son, Cæsarion. It was dedicated to Hathor, the Egyptian Venus, hence Cleopatra chose it as the preserver of her own image. The Temple of Karnak was similar to that of Luxor, only on a grander scale. In front of the gate stood a pylon, or outer wall or arch. Here was the world-famous avenue of sphinxes. The temple was dedicated to Ammon-Ra, and was by far the grandest religious structure of the globe. The Cathedral of Notre Dame, Paris, could be placed in its inner court, and the area of the temple was three times as great as that of St Peter's, Rome. Homer called it "the hundred-gated Thebes," and the accuracy of the description was proved by the majestic ruins. A single obelisk remained, and it bore the statement that it was erected by Queen Hatshepsut, in the space of seven months. It was dedicated to Ammon-Ra, and was covered with gold, so that when the sun rose the rays of light were reflected for miles, and kept in memory the name and power of the god. On one of the walls was the inscription of Sheshenk, or Shishak, who conquered Palestine in the time of Rehoboam; and a full description in pictures of the ancient processional of the priests of Ammon. At Thebes had been found a picture which threw a flood of light upon the past. In a procession were shown several negroes bearing ivory and leading a dog-ape. The date of the carving is not later than 1500 B.C., and showed that the differences between the races of man were as great nearly 4000 years ago as to-day.

THE new building of the Central Savings Bank has a considerable frontage in Carter-lane and in Addle-hill. It is situated in the midst of narrow lanes, and is so shut in by lofty warehouses that it is almost impossible to obtain a satisfactory view of the building as a whole. Like the original building in Queen-Victoria-street, it is unpretentious in style, but it bears the stamp of having been designed for use and not for ornament, and the most noticeable feature from the outside is the large size

of the numerous windows, which would lead one to expect bright and airy rooms. Although, however, the lower floors are inevitably somewhat darkened by the narrowness of the streets from which the light has to be derived, the upper stories are splendidly lighted, whilst the top floor is also provided with large skylights. The building consists of four upper stories, the ground floor, and the basement. Ascending by means of a lift to the top of the building, the first rooms to claim attention are the dining-rooms provided for the staff. The rest of the fourth floor is occupied by a portion of the correspondence department. The third floor is divided into two equal portions, one of which is taken up by the remainder of the correspondence branch. The other half of the third floor and the whole of the second floor are given up to the ledger branch. The first floor is occupied by the general correspondence branch, one portion of which is devoted to correspondence with postmasters only. On this floor there is also the annuity and insurance department, a branch of the savings bank which, owing to various causes, has never increased like the other departments. The ground floor contains the department connected with the friendly and charitable societies that use the savings bank, and the warrant inquiry branch. The kitchens for the boy messengers and porters are situated in the basement, as is also a small room, which contains the lending library of the boy messengers. The electrical plant (which consists of four large dynamos), the hot water apparatus, and the engines for working the dynamos are placed in another portion of the basement.

LAURENCE POUNTNEY HILL still maintains somewhat of the air of quietude which it enjoyed when, in the bygone days, it was regarded as a fashionable residential quarter. Turning from the bustle of Cannon Street, and the huge modern erections there, one is at once confronted with several old houses, whose history, if it could be unearthed, would doubtless be rich in ancient associations. The old churchyard of St. Laurence Pountney still remains, and in summer is one of those little green spots amidst a sea of bricks and mortar that afford to the eye a sense of rest. The carving of the doorways of several of the houses is still preserved intact. Over the doorway of No. 2 there appears the date, 1703, giving evidence that the houses were most likely built after the fire. The interior of two of these houses—they are now used as offices, and, consequently, are considerably altered—affords a sense of roominess and comfort that is rarely met with in the houses of to-day. The staircases are wide, the banisters being very perfect specimens of twisted oak, and here and there are pieces of old carving. It was very near these old places that Sir Laurence Pountney, one of London's Lord Mayors, resided. In the contiguous lane, named after the Duke of Suffolk, and near which that nobleman lived, are several other mansions which still preserve their old-world appearance, and close adjoining is the site on which Merchant Taylors' School once stood—now covered by a block of modern warehouses.

THE definite scheme for the decoration of the streets through which the royal procession will pass on June 22nd has been still further worked out in detail. The arch to be erected in King William Street is to be emblematic of the African colonies, and will consist of a gold and ivory structure, ornamented with horns, ostrich feathers, &c. The design for the decoration of London Bridge itself consists in the erection of a number of poops of old vessels on the piers on either side of the bridge, which will at night be lighted up with ships' lamps. The arches spanning the roadway over the bridge will be outlined at night by means of rows of small electric lamps, and the approaches will be brilliantly illuminated with large electric arc lamps placed at intervals.

IN Edinburgh the problem of finding a site for the new hall for meetings and concerts, towards which a patriotic citizen has offered a gift of £100,000, is still awaiting solution. A

proposal has just been carried in a sub-committee of the Town Council to remove for this purpose a portion, or the whole, of the houses on the north side of Charlotte Square. As this square is an acknowledged masterpiece by Robert Adam, and one of the best and most complete specimens of domestic Architecture in the neo-classic style in Great Britain, the proposal is encountering a very warm opposition.

THE Church in which Dr. Johnson used to worship, St. Clement Dane's, in the Strand, is in need of repair, and it is proposed to appeal for funds on the strength of the doctor's name, and the repairs are to be called a "Johnson Memorial." The old organ requires renovating, the marble table needs polishing and patching, and some windows which have long been closed are to be filled with stained glass and opened. It will cost between £2000 and £3000.

A CORRESPONDENT writes:—"The Lord Mayor was rather unfortunate in his reference, on the occasion of the opening of the Building Trades Exhibition, to the Crystal Palace as an instance of the triumph of the building trades. If he had enquired of Professor Banister Fletcher, he would have probably informed him that the Crystal Palace owes its origin primarily to a sketch on a piece of blotting paper by the then Duke of Devonshire's gardener, from which a design was worked out by Sir Charles Barry (who suggested the dome) and an engineer, Sir Charles Fox, who prepared the details. The only building trades engaged in the construction of the building were carpenters, glaziers, and painters. The building was a success as a temporary structure, but can scarcely be considered as a triumph of Craftsmanship, it being rather of the nature of engineering work. The public are apt to be led away by the size of a building, and are apt to consider that a work of Art is to be valued in proportion to its bulk rather than its quality. The choragic monument of Demosthenes, which is not much bigger than Aldgate pump, is a more remarkable work than the Pyramids themselves, for all their size.

THE great telescope of the Berlin Exhibition last year is being erected at the Observatory of Grünwald for the observation of the stars. This remarkable instrument is a novelty, and resembles a long cannon on its carriage. The tube is over 60ft. in length, and is moved by an electric motor. It has two object glasses, one for the eye, the other for the spectroscope and photography. The telescope will give an image of the sun nearly two feet in diameter, and will not be protected from the weather by a cupola, which would be very expensive, owing to its dimensions.

A WEEK hence one of the oldest ecclesiastical buildings in France, the Church of St. Pierre, which crowns the height of Montmartre, will be closed to public worship, and the structure will be pulled down to prevent its falling to pieces of its own accord. The site is believed to have been occupied by a Roman temple, which was converted to Christian uses in the Merovingian era. This the Normans swept away, and Louis VII., to please his consort Alix, raised, towards the middle of the twelfth century, the beautiful specimen of Architecture which is still represented by the apse known as Le Chœur des Dames. Upon its summit the revolutionary authorities set up a semaphore which was visible from almost every quarter of the city. To this day may be seen the stout beam of oak which carried the moving arms. Later generations stuck a hideous façade and a yet more incongruous steeple on to the exquisite work of the Norman masons.

AT Brighton the old road along the edge of the cliff to Rottingdean has been declared to be dangerous at a point near Black Rock, and has been closed. This result, which has long been foreseen, has been brought about by recent falls of the cliff, caused partly by the disintegration of the chalk by the weather, and partly by the action of the sea, which at high water washes against the base of the cliff. Whilst

Brighton and the places westward have spent vast sums upon sea defences, little or nothing has been done to protect the foreshore eastwards between Brighton and Rottingdean, the property owners being apparently disinclined to incur the heavy expense entailed by such defensive measures. Year after year vast masses of the tall cliffs have been detached and sunk into the sea, the edge of the cliffs being brought gradually inland. About a couple of years ago the disappearance of a huge portion of the cliff made it necessary that carriage traffic should be stopped, and a new loop road was constructed about a quarter of a mile inland. The alteration in the aspect of the cliffs during the past twenty years, more particularly during the more recent years, has been of a most marked character. Some coast-guard cottages stand close to the portion of the road now closed, and these, it would seem, will ere long be imperilled if the denudation of the cliff continues. The most serious falls of cliff have occurred not far from a part well known to geologists as the elephant bed, where a darker stratum in the chalk marks where, in some far-off period, the remains of that animal was carried down by glacial action or otherwise towards what is now the Channel, but which in those days presumably was the continuous bed of chalk that joined this country to the Continent.

An exhibition of studies, with a few completed drawings, by Mr. John M. Swan, A.R.A., is now open at the galleries of the Fine Art Society in New Bond Street. The majority of the hundred and more productions on view are in black and white chalk and coloured pastels, on tinted paper, chiefly grey and blue. It is astonishing what vigour and solidity Mr. Swan can indicate with a few bold strokes; and, in dealing with the lion and lioness, the leopard, the tiger, the jaguar, the Polar bear, and the rest, he not only represents their points of strength, but everything in the way of grace or suppleness that can be discovered in their attitudes and movements. The limppness of repose is as finely delineated as the energy of action.

THE work that is in progress for the Battenberg Memorial Chapel at Whippingham will be completed by July. It may be interesting to state that a sarcophagus is being prepared from the designs of Mr. A. Y. Nutt, Her Majesty's resident Architect at Windsor Castle. He is also having an altar table made for the Princess Henry. Three painted windows with figure subjects are being made by Mr. Ion Pace, and these works, in conjunction with Mr. Gilbert's really fine screen of hammered metal, will make the Memorial Chapel one of the choicest pieces of funerary Art of our time. There is now no intention of putting up any monument to the late Prince, except, perhaps, a marble bust, in the Mausoleum and Frogmore, and no progress has been made with the projected memorial for St. George's Chapel, Windsor.

THE Kremlin is the most interesting part of a picturesque and beautiful city, says Mr. J. D. Ross, writing of a visit to Moscow. It is situated in the very heart of Moscow, on a hill of about a 100ft. in height, and in the dim and distant twelfth century it was a fortified camp surrounded by palisades, when it was the stronghold of Ioury Vladimirovitch Dolgorouki. The Kremlin of to-day is an antiquated fortress surrounded with immense crenelated walls of a height of some 70ft., and over a mile and a half in circuit, pierced by five gates, and protected by 18 towers. Within the Kremlin walls there is an immense assemblage of cathedrals, palaces, and barracks, which strikingly illustrate the union of Church and State in Holy Russia. Great pains have been taken to preserve the ancient buildings of the Kremlin in their original condition, so far as it has been possible to do so. The palace of the "Tchérem" still contains the quaint old banqueting hall in which the Czars of bygone days held high revel with their boyards, while their women looked on from a gallery above, carefully screened from the gaze of the indiscreet. The timeworn beds

and chairs of those remote days still furnish the queer ill-lighted rooms in which those fearsome autocrats lived, and the dread shade of Ivan the Terrible still seems to haunt the venerable structures amid which he spent so many years of his atrocious life. Every stone of the buildings within the Kremlin walls seems to have its history, and to have been the mute witness either of some superb imperial pageant or of some blood-stained tragedy, some dark and nameless crime in which human wickedness and cruelty have found their utmost expression. How little is really known of the Kremlin may be realised by the fact that when the foundations were being sunk for the splendid monument to the memory of Alexander II., which has just been completed, the Architects came upon a whole system of subterranean passages, prisons, and torture-chambers, of which no living man had any idea. A real history of the Kremlin would prove to be one of the most absorbing and instructive books ever written by man. The modern palaces of the Kremlin are of great size and magnificence, the vast salons of the "Great Palace," named after St. George, St. Alexander, and St. Andrew, are superbly decorated with the insignia of these orders of knighthood. Beautiful pictures, mirrors, and gilding are lavished everywhere.

WHILE workmen were engaged recently making a track for new water pipes at Cullen, they came upon two urns. In breaking off the end of a rough, unshapen block of gneiss that projected into the track, and removing the earth, the side of one urn was removed along with it. The greater part of the urn remained in its original position, covered by the heavy block of stone, and above the stone, strange to say, there was growing a tree of considerable size. It was found to be a cinerary urn, 11½ in. in height and 9 in. in width at the mouth. As usual, the upper part was ornamented with markings. On a shapely, oblong slab of mica-schist the burned bones rested in a heap, and over them was placed the urn, with the mouth, as usual, downwards, resting on the slab, and around the mouth clay appeared to have been placed to exclude the air. About 2 ft. farther on the track, and at a depth of 12 in. from the surface, the workmen came upon a smaller urn of food-vessel type, 5½ in. in height, 2½ in. in diameter at the base, and 4½ in. at the mouth, and with no ornamentation. It lay mouth upwards, with no protecting stones, and contained a considerable quantity of burned bones.

A SICILIAN peasant's house consists of one room with a kind of attic above, roughly roofed with tiles, through the imperfect jointings of which the rain drips in wet weather. In this single room are huddled together parents and children, the mule or ass, the pig, and the fowls. An ancient table, a mattress, a few straw-bottomed chairs, and a chest or two comprises the furniture. By the hearth hangs a small sack filled with all kinds of wooden spoons; on a shelf stand the terra-cotta lamp and a few pots and pans. In some houses there is also an old-fashioned weaver's loom. In the attic the hay and corn are stored, and if it be roomy it serves also for the children's bedroom; if not, the parents endeavour, by hanging clothes on a rope, or by a paper screen, to separate their own resting-place from that of the elder children.

A MOSAIC of unusual interest has been discovered by the secretary of the Greek Patriarch of Jerusalem. It purports to be a map of Palestine and Lower Egypt, illustrated with picturesque details, such as trees of different species, fish swimming in the Jordan and Nile, and boats on the Dead Sea. The towns are represented by groups of houses, Churches, fountains, etc. The mosaic dates from the Justinian era, and has formed part of the floor of a basilica discovered at Madaba, beyond the Jordan.

PROFESSOR FABRE has just made a most surprising discovery in the archives of Amsterdam of some very old maps, made between 1705 and 1719, showing the regions in Central

Africa, which have in modern times been rediscovered by Livingstone and Stanley. The maps were based on information furnished by Portuguese traders, and according to Professor Fabre are, on the whole, accurate. The course of the Congo under another name is laid down. In addition to the maps, Professor Fabre found several documents giving information derived from the blacks of the great lakes which form the source of the Nile, and which Livingstone and Stanley named Victoria Nyanza. It is curious that all modern explorations should have been made without any knowledge of the fact that this territory had to some extent been explored and mapped nearly two centuries before. The Zambesi territory was better known to the Portuguese in 1700 than it is even now to modern discoverers. They had considerable settlements at the mouth of the Zambesi river, traces of which are still to be seen.

A PANEL of Mortlake tapestry made for Charles I., when Prince of Wales, was recently sold at Christie's, and brought £380. It measured 15 ft. by 18 ft., the subject being "The Rape of Helen," in a rich border with allegorical figures in medallions, and various masks, arabesques, and scrolls in brilliant colours, and the letter C interlaced at the sides and surmounted by a crown. Above is the Prince of Wales's plume with a crown, and beneath a trophy of sceptres and a motto in Latin. A pair of old Brussels panels fetched £100, and a suite of Louis XVI. carved and gilt wood furniture, with old French tapestry backs and seats illustrating La Fontaine's fables, was knocked down at £210. A large cylindrical Chinese vase, famille verte porcelain, richly enamelled with a river scene and figures, and another vase with nearly similar decoration, realised £650; an old Dresden service painted with bouquets and sprays of flowers on white ground, 66gs.; a pair of famille verte figures of kylin, on square pedestals, 17 in. high, £68; and an old Nankin vase, embellished with landscapes, figures, &c., 115gs.

It is proposed to widen the southern end of Little Trinity Lane. The thoroughfare is one of the numerous and narrow streets which lead from Queen Victoria Street into Upper Thames Street. The greater part of the street is of a uniform width, the upper portion being widened soon after the opening of the Mansion House Railway Station, and there is room for two vans to pass. At the foot of the street, however, the premises and pavement on the left-hand side project out into the street, rendering it only possible for one van to pass in or out at a time. A public-house next door was recently set back so as to conform to the line of frontage, but the premises at the corner remain in their original position, and create an obstruction which might, apparently, be easily and cheaply set back also.

At the last meeting of the Strand Board of Works the Works Committee's report, which stated that the estimated cost of paving certain streets in the district during the ensuing year was £2265, was adopted. The Committee also recommended that a new sewer should be laid in Church Street, Soho, at an estimated expense of £1426, and that an additional sum of £1000 should be allocated for the general repairs of the sewers. The resolution was carried. It was agreed that the sum of £2000 should be provided for general paving repairs in different parts of the district, the work to be carried out by the Improved Wood Pavement Company upon the terms of their existing contracts as to laying and maintenance.

THE full-length bronze statue of the late Sir Richard Owen, upon which Mr. Thomas Brock, R.A., has for some time been engaged, has now been placed in the Central Hall of the Natural History Museum at South Kensington, in a prominent position, facing the late Sir Edgar Boehm's statue of Charles Darwin. Owen is represented wearing the gown of a professor of the Royal College of Surgeons, and holding in his left hand a fossil bone of an extinct New Zealand bird. The

statue is the outcome of the movement started in 1893, after Owen's death, for the promotion of a national memorial to commemorate the great palaeontologist's eminent services to science.

### THE NEW FIRE-ENGINE STATION AT ABERDEEN.

MR. A. H. L. MACKINNON has secured the first premium for the new fire-engine station. Mr. J. A. Ogg Allan is placed second and Mr. John Rust third. The assessor was Mr. Muntz, of Belfast, who will submit his full report to the committee at an early date. The site of the new Fire Brigade Station, Weights and Measures, and Lighting Departments, all of which are comprehended in the plans, is on the east side of King Street, and lies directly south of the Great North of Scotland Railway. The entire space has a frontage to King Street of 200 ft., with an average depth of about equal amount, but, as a portion of about 90 ft. square in the north-west corner is reserved for future extensions, the frontage of the new establishment to King Street will be a little over a hundred feet. Mr. Mackinnon's design is externally of a plain and substantial character, utility being the main feature aimed at throughout. The main structure on the plans is a large main building, fronting King Street, accommodating the Fire Department proper. The building is two stories in height and about 70 ft. long, built, like all the buildings, of granite. The front is pierced on the ground floor by four segmental arched doorways leading into the engine-house. Here accommodation is provided for four engines. The stables are directly behind the engine-house, the doors opening inwards from the latter. There is accommodation for six horses. A staircase leads from the engine-room to the first floor, in which is the dormitory for the unmarried members of the fire brigade, with accommodation for six men; and a large recreation room, with bathroom, lavatories, and all efficient furnishings. The staircase is not meant for descent, however, in the case of the brigade being called out. Ample arrangements are made for the ventilation of the building. The heating is to be by hot-water coils, the heating apparatus being placed in the basement part of the tower. This tower, which is intended for the drying of the hose, stands at the north-east corner of the main building. It rises to a height of about 75 ft., a handsome structure of granite, finished with a curved slated top. Arrangements are made for the drying of the firemen's clothes, and for other emergencies incidental to the brigade work. At the north end of the main building, and separated from it by a passage way, stands the firemaster's house—a two-story structure, with the gable towards King Street. Stretching backward from the south end of the main building is a line of one-story erections, containing the harness-room, coach-house, store-rooms, &c., connected with the fire brigade. Then across the rear of the site runs a line of two-story buildings, comprising the assistant firemaster's house and the married firemen's quarters, accommodation being provided for four of the latter. The central area behind the main building and the married firemen's quarters will be utilised as the brigade drill-yard. The Weights and Measures Department are to be located in a line of one-story buildings to the north of the married firemen's quarters; and at the extreme northern side of the ground, running alongside the railway, are to be erected the line of buildings for the Lighting Department. Mr. Allan's design, which has been awarded second place, is, so far as regards the general arrangement of the various departments, very similar to that of Mr. Mackinnon. Mr. Mackinnon's estimate is £10,400, and Mr. Allan's £11,000.

A NEW Unitarian church is to be erected at Small Heath, Birmingham. The trustees of the Church of the Saviour have promised £850 from the proceeds of the sale of their premises. The total cost is expected to reach £3000.

## HERALDRY OF THE RENAISSANCE IN ENGLAND.\*

By J. ALFRED GOTCH, F.S.A.

IN dealing with the subject of Heraldry before an audience of Architects—or chiefly Architects—I propose to approach it from the decorative side, not from the scientific; for Architects are not likely to be called upon to grant arms to their clients, or even to marshal them for them, whereas it is not at all improbable that they may have to draw them; and to do this successfully it is essential to know something of decorative heraldry. During the latter half of the sixteenth century and the earlier half of the seventeenth, there was a general desire to make much of the antiquity and respectability of one's family, and one method of doing this was to display one's arms. There were many upstarts in Elizabeth's days; some of the proudest of our historic families emerged from obscurity into the dazzling light of her splendour, and presently afterwards fell to peopling that obscurity with ancestors whom it was no one's concern to challenge, but who, if they had been challenged, would have been as elusive as the ghost of Hamlet's father. The rearing not only of a large family, but also of a large ancestry, was characteristic of the times. It is astonishing how, in the grants of

### ARMS OF THE PERIOD,

it appears that the Merchant Taylor, let us say, though of long descent, has forgotten what his ancestors' arms were, and how he requests the herald to search in the registers and records of his office; how the herald, impressed with the antiquity of the tailor's descent, cannot refuse to do so, with the result of happily discovering what those ancient arms were, and of confirming the grant of them to the tailor. When the posthumous granting of arms to persons who could have had no concern with them is considered, we can realise how far heraldry had travelled from its original starting-point three centuries before. From being matters of daily, practical use, armorial bearings had come to be what certain rudimentary organs of many animals are, a mere indication of particular ancestry; and so by implication a mark of gentility. Being no longer part of everybody's daily life, it had become necessary to write the history and science of them, and, like other things in this world, from being matters of popular knowledge, they came at length to be mysteries in the keeping of

### A KIND OF PRIESTHOOD.

The next inevitable stage was crystallisation. Rules were laid down which shared the fate of many other rules if blindly adhered to: instead of being guides they became goals; instead of fostering individuality they produced monotony. The origin of armorial bearings being forgotten, the application of them tended to become illogical, and heraldry gradually declined both as a science and as a Decorative Art. The drawing became too realistic, and lost its proper conventional treatment; the bearings were depicted in the round instead of the flat. Draughtsmen were too well instructed in general matters; they had got to know what live lions really looked like, they were familiar with many animals and things which their ancestors knew chiefly by conjecture, and they utilised their knowledge to the detriment of their design. The eighteenth century squires gradually fell out of their forefathers' habit of adorning their houses with heraldry. Shenstone says, in one of his essays: "Antiquity of family and distinctions of gentry have, perhaps, less weight in this age than they had ever before; the bent dexter or sinister, the chief, the canton, or the chevron, are greatly out of date. The heralds are at length discovered to have no legal authority." Heraldry, indeed, became little more than

### A MATTER OF BOOK-PLATES,

and even these were threatened with extinction, since arms were granted which defied

depiction, such as those mentioned by Boutell, in which one of the thirteen charges was "a book duly clasped and ornamented, having on it a silver penny, upon which is written the Lord's Prayer." Another cause of deterioration in heraldic drawing arose directly from the change in the object of heraldry—namely, its becoming an indication of ancient descent; for one of the marks of ancient descent, and of great alliances, was to have many quarters to one's shield. If a man married an heiress his son inherited not only his mother's possessions, but also her paternal arms. This multiplication of quarterings not only tended to make the shield look fussy and confused, but it so reduced the scale of each coat as to render spirited drawing impossible. There is in the hall at Fawsley, in Northamptonshire, an achievement of the Knightleys, containing 334 quarters, which is 330 too many for decorative effect. But although the heraldry of the Renaissance contained within itself

### THE GERMS OF ITS OWN DECAY,

it flourished vigorously enough. The designers of the time loved to avail themselves of it in all materials and in all connections. There is hardly a building of the period of Elizabeth and James that has not its owner's arms carved conspicuously upon it. The joiner and plasterer were not behind the mason in using such excellent decorative motifs as heraldry afforded. Hundreds of elaborate chimney-pieces exhibited as the focus of their splendour the owner's arms. The intricacies of a hundred ceilings encompassed the same proud object. Scores of windows glowed with the colours of his achievement. As he gazed into the fire the flames lit up the same inspiring theme on the fireback, and the embers warmed at once his feet and his arms. The book which lay upon his knee bore on its leather cover still the same device, stamped in gold, or else inside, printed on a book-plate. The family animal surveyed mankind from the

### LOFTY PINNACLES OF THE ROOF,

or mounted guard on the newels of the staircase, or stood rampant in the ascending panels of its balustrade. In the payments on account of the Royal houses in the sixteenth century a charge is often made for carving the "king's beasts." To all uses, great and small, was the device of the family put, even to the most insignificant, as at Farleigh Castle, where the garb (or sheaf) and sickles of the Hungerfords form the escutcheon of a lock. But in no connection was heraldry more freely used than in tombs and monuments to the dead, and we can imagine how much it must have mitigated the grief at the loss of a parent to be able to display all his heraldic magnificence over his grave. Apart altogether from its decorative aspect, heraldry is most useful in historical research. Many a clue is afforded by the presence of a shield or a badge in a building which has outlived its story, and

### MANY A SIDE LIGHT

is thrown on the process of research. Take, for instance, Rushton Hall. There we find two gables alike in design, but bearing different shields, one with the trefoils of Tresham, the other with the cocks of Cockayne. How much does that difference imply? It means the downfall of the first family through complicity in Gunpowder Plot, and the succession of the second to the house and estate, and not only its succession but its taking up and continuing the enlargement of the house in the old spirit and on the old lines of design. There are, of course, certain rules and regulations which have to be observed, but, within their limits, the more freedom the better; in fact, freedom is essential to decorative effect. For instance, the rule was that a bend must occupy one-fifth of the field. But the width of the bend ought to depend upon the space occupied by the charges on either side of it, and on the fact of its being itself charged or not, always bearing in mind that it must not be so narrow as to become a bendlet. Another rule was that the chief must occupy one-third of the field; but here also the depth must depend upon the charges in the field. So, too, in the drawing of charges themselves. The

characteristic charge that distinguishes the coat must be preserved, but within that limit it may be treated according to the taste of the designer. For instance, a lion rampant must always be made a lion rampant, but there is no need to have his head and his four legs in precisely the same relation to each other, nor need his tail

### ALWAYS TAKE THE SAME CURVES.

These things may be varied according to the space to be filled. Broadly speaking, the treatment may be as free as possible, so long as no new idea is introduced. Thus the lion rampant is one idea; the lion salient (or about to spring) is another. The lion rampant always looks in the direction in which he is going; but if you change the idea and make him look towards the spectator, he becomes a lion rampant gardant. A lion rampant, if he has to fill a tall, narrow space, will be thin and long, and very upright; if he has to fill a comparatively square space, he will be thin, it is true, but less thin, shorter, and not so perpendicular in attitude; but in both cases he will be rampant. If the heraldry of the sixteenth and even seventeenth century is compared with that of the eighteenth or early nineteenth, it will be at once apparent how the draughtmanship deteriorated, and

### HOW COMMONPLACE THE DRAWING BECAME.

Under such treatment the poetry evaporated, and an additional excuse was furnished for the contempt into which the whole subject fell. Heraldic drawing is not an easy matter; if it is to be revived, it must be done not by a mere copying of old examples and a departed style. The designer must be a skilful draughtsman, combining vigour of pencil with a strong feeling for anatomy; so that if an animal has to be drawn its particular characteristics may be presented in a truthful though conventional way, with as few strokes as possible. The designer, too, must steep himself in the subject, so that he has its rationale at his fingers' ends—not necessarily a long or tedious thing to do. But when he is properly equipped he will find

### FEW FIELDS OF DESIGN MORE ATTRACTIVE,

or lending themselves in a greater degree to pure enjoyment of making lines express beauty, and fancy, and force. A lengthy series of illustrations, showing great vigour of design, followed the paper, after which Mr. J. M. Brydon, in proposing a vote of thanks to Mr. Gotch, remarked that the paper had settled a very vexed question for them—whether Architecture was a profession or an Art. It seemed to be neither. It was a mechanical contrivance; and he was quite ready to accept the dictum and become a craftsman. As craftsmen, heraldry must appeal to them from two aspects—the one historical, and the other decorative—and the speaker proceeded to enlarge on both these points, commending Mr. Gotch for having given instruction of such great use and importance to students of Architecture who, in their practice, were constantly using arms.—Mr. St. John Hope seconded the vote of thanks, agreeing with Mr. Gotch as to the disrepute of heraldry through it being brought into a crystallised condition. He also deprecated the multiplying of quarters as destructive of a great deal of the artistic beauty of ancient heraldry. There was no doubt that to draw heraldry properly they must become soaked in the subject, and one of the best sources from which heraldry might be learnt was that of shields. It was unfortunate that the places where shields were to be found were rather difficult of access; and in his opinion there ought to be a collection of casts at South Kensington, so as to enable them to institute useful comparisons from period to period, or from year to year.—Mr. H. H. Statham agreed that in a retrospective sense heraldry was a most valuable study, but it seemed to him that in the present day it was only to be regarded as a kind of pastime—a picturesque one certainly. He thought there was a wide field for a new species of heraldic animals, and commented upon the increased Architectural effect obtained when heraldry and Architecture were worked out together.—The vote of thanks was carried and acknowledged by Mr. Gotch.

\* Extracts of paper read on Monday night before the Royal Institute of British Architects.

## Professional Items.

**ABERDEEN.**—The new Church in Rosemount Viaduct for the St. Paul's U.P. congregation has been opened to the public. The building is a commodious structure with accommodation for 650 worshippers. The internal furnishings are all of selected pitch pine, light stained. A gallery runs right round the Church, that portion behind the pulpit at the east-end being set apart for the choir. The pulpit itself is of a semi-platform design, access being obtained by a staircase at each side. The building is heated throughout by steam, and fitted with the electric light. In the basement are three halls, the largest capable of accommodating about 250 persons, but should necessity arise it can be enlarged by the addition of one of the adjoining halls, so as to accommodate about a hundred more. A house for the Church officer is also provided in the basement. The contractors for the Church, which will cost between £5000 and £6000, were: Mason work, Leslie Smith; joiner, Hendry and Keith; painter, William Philip; plasterer, W. Ross; plumber, John Thom; heating apparatus and electric light installation, Shirras, Laing, and Co. The Architects are Messrs. Ellis and Wilson.

At the last meeting of the Plans Committee of the Aberdeen Town Council, plans were submitted of fifteen new buildings, all dwelling-houses, proposed to be erected in different parts of the city. The value of the new property is between £9000 and £10,000.

**ARBROATH.**—The Postal Authorities are now advertising for a site for a new Post Office in Arbroath, their intention being apparently to build in place of leasing a property. The site wanted must be within 100 yards of the High Street; and, as showing that the intention of the authorities seems to be to put up a building of some Architectural pretensions, it may be mentioned that it is specified that the site must contain not less than 600 square yards, with a frontage of not less than 60ft. A good many people seem to think that the site occupied by the west-most portion of the market buildings would form a most central and suitable place for a Post Office. These buildings have for years past been practically a "white elephant," and could probably be disposed of at a low figure to the Post Office Authorities.

**BANGOR.**—The memorial stone of the county school for girls, which is being erected in Upper Bangor from the designs of Mr. Phillips, was laid on the 20th inst.

**BRADFORD.**—A meeting of the Bradford School Board was held last week. The Sites and Buildings Committee recommended that a resolution, adopted at the last ordinary meeting, to use mechanical ventilation, fire-proof flooring, and wood-block flooring in the construction of the Carlton Street Higher Girls' School and the Junior Teachers' Central Classes be cancelled. After several amendments had been put and lost the recommendation was adopted.

**BRECHIN, N.B.**—The Parish Council some time ago resolved to erect offices wholly for their own use, and at the Committee's usual monthly meeting plans from various Architects were under consideration. After discussing the respective merits of the plans, those prepared by Mr. D. Wishart Galloway, of Brechin, were adopted. The building comprises a Council Chamber measuring 28ft. by 18ft. by 16ft. ceiling; Clerk's room, 24ft. by 19ft. by 14ft., with separate spaces for the public when registering and paying assessments. The Inspector's private room is situated at the rear of the building, and is so arranged that the Inspector has direct communication with the Council Chamber and public office. A private entrance from the vestibule is also provided to the Inspector's room. The style of Architecture adopted is what may be termed a free or

nineteenth century treatment of Scotch Renaissance characteristic of the district.

**COVENTRY.**—Coventry is to have a second theatre, built on the site of the oldest one in the city, in Smithford Street, and having a frontage to that important thoroughfare.

**DEWSBURY.**—A new club-house has been opened in Boothroyd Lane, Dewsbury, which has been erected from designs by Messrs. D. and W. Thornton, Architects, of Dewsbury. The structure stands upon the site of the old club-house, but occupies more ground, and is both substantial and commodious.

**DUNDEE.**—The building and allied trades of Dundee are at the present time in a flourishing condition. The winter has been fairly open, and building operations have suffered comparatively little interruption from frost and snow. There has also been abundance of work on hand, and prospects are equally satisfactory. All branches of the trade have, therefore, been in full swing, there having even been a scarcity of men in some departments, for the briskness has not been confined to Dundee, but is general throughout the country. Two of the largest of the buildings at present in course of erection are now wearing on towards completion. The mason work of the new Post-office will be finished early this spring, while the new offices of the Prudential Assurance Company will be ready for occupancy in May. Fortunately, however, for the trade there has been quite a crop of large "jobs" launched since the year began. In addition to the new block for the Pearl Assurance Company, there are in prospect the Royal Bank buildings in High Street, large wine and spirit stores in Seagate for Messrs. John Robertson and Son, Limited, and Mr. George Willsher, the Roman Catholic House of Mercy and Convalescent Home, the Caird Hospital for Women, and a number of other and smaller undertakings, while there is also a fair amount of tenement, terrace, and villa property in prospect.

**DUMFRIES.**—Plans have been accepted by the Dumfries Burgh School Board for a new elementary school. The new school will occupy a situation fronting George Street and also overlooking the Nith. The plan selected is by Mr. A. B. Crombie, Architect, and is chosen from several competitive Designs. The building is fully furnished with all modern improvements and equipments. It is partly of two stories, and the whole of the class rooms for the various standards in the upper school are arranged round a commodious central hall on the ground floor level. The entrances for boys and girls are placed at each side of the front two-story block, with cloak rooms and separate staircases. The central hall is amply lighted by a large lantern on the roof, the lights of which are vertical, and fitted with iron rod adjustments for opening and closing, similar to those used in conservatories. The cost of the school is estimated at under £6000.

**EVESHAM.**—The Buildings Committee has made enquiry into the existing accommodation at the workhouse. It decided that more accommodation was urgently required, and that by building a new workhouse on the present site a much better and more economical arrangement could be made than by alterations, and the proposal has been unanimously adopted, and the services of Mr. G. H. Hunt, as Architect, have been secured.

**GLASGOW.**—At the recent meeting of the Glasgow Dean of Guild Court plans of a large number of new buildings were approved. The Corporation were authorised to make certain additions at the Cattle Market; the erection of tenements of shops and dwelling-houses in Main Street, Bridgeton, Garscube Road, and Alexandra Parade was approved; the necessary permission was given for the formation of a new private street on the lands of Gairbraid, Maryhill; and the trustees of Victoria Place Baptist Church were authorised to erect a new Church at the corner of

Langside Road and Butterbiggins Road. The extensive block at the north-east corner of Sauchiehall Street and Cambridge Street is to be taken down, and a large building erected on the site.

The pile of buildings in West Regent Street, Glasgow, which forms a fine suite of Masonic premises, was opened on the 20th inst. The building has been erected from designs by Mr. J. L. Cowan, Architect, Glasgow. It is four stories in height, and the style may be classed as a free treatment of old English Renaissance. There are practically two buildings on the ground, one to the front and the other behind, the one section being devoted to Masonic purposes, and the other let as writers' offices and for commercial purposes generally. The chief feature is a grand hall suitable for lectures and concerts, 64ft. long and 38ft. wide, seated for 400 persons. It has a platform at one end, on which there is a divided pneumatic organ by Messrs. Brindley and Forster, Sheffield. Something approaching £16,000 has been expended on the ground, buildings, and furnishings.

**GOBOWEN.**—The new church which has been erected for the Wesleyan Methodists at Gobowen was opened last week. The building, which adjoins the old chapel, long felt to be much too small, has a frontage to the Holyhead road, is 37ft. long by 26½ft. wide, and will seat some 120 persons. Ruabon red pressed bricks have been used, with white bricks for the window coigns, and the front is relieved with Grinshill stonework and brickwork combined. The interior, which has a light and bright appearance, is fitted up with pitch pine work, and Boyle's ventilating system has been adopted. A porch and vestry are provided, and the old chapel will now serve the purpose of a schoolroom. The work has been carried out by Messrs. Griffiths and Son, builders, Ellesmere and Knockin, from plans and specifications prepared by the Rev. S. H. Terrill, of Oswestry.

**HARROGATE.**—For some time past the North-Eastern Railway Company has been carrying out extensive improvements at the Harrogate Railway Station. Considerable advance has latterly been made with the structural alterations in the station proper, the main entrance on the west side having been enlarged and new and more complete offices erected. Immediately in front of the entrance an ornamental iron portico has been erected, and this it is intended to cover with glass. An entirely new entrance to the up-line platform has been constructed on the south side, two large villas in Grosvenor Terrace having been demolished to make room for the roadway and approach. A new and much larger bridge is being constructed in Station Road, and in the centre of the station a double bridge is nearing completion. One side is intended to be used for passengers and the other for luggage, the latter being conveyed to and from the up and down platforms by a hydraulic lift. The new goods and coal depôts on the line side on the Dragon estate are assuming extensive proportions, and, when completed, will relieve the traffic at the present time conducted in these departments at Starbeck.

**HULL.**—The Corporation proposes to purchase the Park Street Orphan Home as a site for the Technical School for the sum of £6500, and to borrow a sum not exceeding £15,000 for such purpose and making the necessary alterations.

**INVERNESS.**—A new block of buildings is to be erected in Academy Street, Inverness, to cost £7000, and will have a frontage of 70ft. to Academy Street and a frontage of 50ft. to the railway thoroughfare. On the ground floor of the building, which is to be four stories in height, there will be four large shops, with cellars underneath, fronting Academy Street. Designed in the classic style of Architecture, both elevations will be faced in red sandstone from Ayrshire. The Architect is Mr. William Mackintosh, Union Street. The successful contractors are: Mason, Mr. Alexander, jun.; carpenter, Mr. Peter Cameron; slaters, Messrs.

James Gray and Son; plumber, Mr. A. J. Russell; plasterers, Fowler and Kennedy; painter, Mr. John Munro; and blacksmiths, the Rose Street Foundry Company, Inverness.

LIVERPOOL.—The new offices of the White Star Line, in James Street, are gradually approaching completion, and they form a striking object as viewed from the landing-stage and the Cheshire shores of the Mersey. Architecturally, the structure has good features, and although it has been built upon a lower foundation, it already towers above nearly every other building in the neighbourhood.

MONTROSE, N.B.—The new hall erected for the accommodation of the Montrose detachment of the 2nd V.B.G.H. was opened by Colonel Wavell, commanding the 42nd Regimental District, on the 20th inst. The Montrose corps has had a spacious drill hall for many years situated in Mill Street, but there was no armoury, recreation-room, or house for the drill-instructor. It was therefore resolved to erect the new hall on the vacant ground at the south side of the old one. Plans were prepared by Mr. John Sims, C.E., who has aimed more at the efficiency of the internal arrangements than any mere external decoration; but the front elevation to Mill Street, from its substantial mason work and size, has an imposing appearance nevertheless. The main hall is 77ft. by 58ft., the roof being in one span. It is 23ft. high to the wall beam, and 30ft. to the crown of roof. At the end of the hall fronting the street an armoury, clothing store, lavatory, &c., have been provided, while the Instructor's house occupies the floor above that. The contractors were: Masons, Messrs. Ford and Son; joiner, Mr. John Davidson; plumber, Mr. A. Taylor; plasterer, Mr. Burness; all of Montrose. The contracts amounted to a total of £2300.

MOUNTSOREL.—A new Primitive Methodist Chapel has been opened, and has cost about £1300. The front elevation is in late Gothic style, built of pressed red bricks, with Derbyshire stone dressings. There is a Gothic window of Cathedral tinted glass with tracings, and also two smaller windows of a similar character. The chapel is 40ft. in length and 30ft. in width, and will seat about 230, while the choir chamber will accommodate about twenty persons. The building is lofty, and the roof is constructed of pitch pine principals, supported by carved stone corbels. The aisles are paved with patent wood blocks. Adjoining are two vestries or class-rooms and a schoolroom, which will accommodate about 200 children. Mr. E. W. Dakin, of Barrow, was the Architect, and Mr. A. Feulks, of Loughborough, was the contractor.

OLDHAM.—The building trade in Oldham is good at the present time, and many of the principal contractors are booked up almost the year out. This has been exemplified by the response made to the public advertisements of the Corporation for tenders for the construction of the underground lavatories at Rhodes Bank. Several firms intimated that owing to pressure of work they could not undertake the contract, and only two actually sent in tenders. One of these was conditional on an extension of the time limit, and both were in excess of the estimated price at a fair figure. The Surveyors Committee, after considering the tenders submitted, together with the estimates of the Borough Surveyor, decided, in face of the strong opposition of the two practical members of the committee—an Architect and a contractor—to decline both tenders, and to entrust the work to the Borough Surveyor. This decision was based upon the estimated saving that would be effected if the cost comes out in accordance with the Surveyor's figures. Considering the experience the Corporation has had in other departments in relying upon official estimates as to the cost of work, the present experiment will be watched with considerable interest.

ST. HELENS.—In consequence of the receipt of an order from the Educational Department stating that school accommodation for 350

more children must be provided with reasonable promptitude, a scheme for complying with the wishes of the Department is to be prepared. It is probable that an additional story will be added to the existing schools, and land near thereto has been acquired for further extensions. It is estimated that the total cost will be about £3000.

ST. IVES.—The Wesleyan Chapel was reopened last week after entire renovation, costing about £2000. The huge and unsightly pillars which stood in the centre of the chapel have been removed, and an iron roof now spans the entire building. The body of the chapel has been refloored, and comfortable new pitch pine seats have been fixed throughout. The gallery has also been re-seated with pews similar to those below, and the floors have been re-arranged. Instead of demolishing the old gallery front, a new framework has been placed against the old with good effect. Mr. O. Caldwell, of Penzance, is the Architect, and Mr. W. J. Winn, of Helston, the contractor.

SHEFFIELD.—At the Town Hall an electrolier, intended to illuminate the grand marble staircase which is entered from the principal door in Pinstone Street, has been recently completed. The electrolier is suspended from the ceiling by a chain of brass, manufactured in an intricate and novel design. It hangs at a considerable height above the ground floor, and all the lamps of the electrolier are equal to more than 400 candles. Mr. Mountford, the Architect of the Town Hall designed the electrolier, and Mr. Pomeroy, who did the sculpture work, has been the modeller. The casting of the electrolier was done by Messrs. Longden and Co., of the Phoenix Foundry, Sheffield.

SUNDERLAND.—The plans for the erection of workmen's dwellings at the East End of Sunderland, by the Corporation, have been amended, in order that cheaper rents may be charged. By the present scheme it is proposed to charge 3s. for two rooms, and 3s. 6d. for three rooms, which is estimated will result in a profit to the ratepayers. The amended plans have not yet been definitely adopted.

TAUNTON.—New premises which have just been erected, to replace the old Sunday school buildings, have been opened by the Mayoress. The old school was very confined in its dimensions, and the need of new and more capacious premises has been felt for many years. Four cottages which adjoined the chapel have been taken down, and on the site has been erected a schoolroom capable of seating 250 persons, with the necessary class-rooms, and preacher's vestry. The total cost has been £600.

TUNBRIDGE WELLS.—A syndicate has been formed to erect a new theatre at Tunbridge Wells. Mr. John P. Briggs, of Effingham House, Arundel Street, has received the appointment as Architect.

It is proposed to erect a new Town Hall at Nottingham. Several liberal contributions have been promised towards the cost.

A MEETING of ratepayers of Ilkley has passed a resolution condemning the purchase of the Town Hall site, and opposing the completion of the scheme.

MESSRS. MAPLE AND Co. have been entrusted with the structural alteration and improvement of the Great Northern Station Hotel, Leeds. To enable the alterations to be carried out the hotel will be closed until July 17th.

At a recent meeting of the Hereford Town Council the General Purposes Committee reported that it had had laid before it, by the Free Library Committee, a general scheme for the enlargement of the library premises by the erection of a lecture-hall, class-rooms, and other accommodation at the back of the present reading-room; and it was recommended that this be accepted by the Council as a memorial for the Diamond Jubilee year, provided that the expenditure be limited to £2000

## Trade and Craft.

### A BUILDER'S CLAIM.

In a case recently tried, the plaintiff, Mr. A. G. Rossiter, builder, Beech Street, Barbican, sued the defendant, Mr. A. Watson, printer, 128 and 129, Minories, who traded as Watson Brothers, to recover £18, being the balance of account for work and labour done. The defendant counter-claimed for a sum of £16 3s., which he said was due to him by reason of the plaintiff's negligent workmanship.—The plaintiff said that in September, 1895, he was requested to do some builders' work to certain premises in Church Street, Minories. This work was carried on under the superintendence of the local authorities. He had given the defendant a verbal estimate for the work required to be done, which amounted to £150, and the account for the work came out at £135 10s. He had received various sums on account, leaving the balance now sued for. The first complaint he received from the defendant as to bad workmanship was about nine months after completion.—The defendant was called, and said he had complained to the plaintiff several times of the way in which he had done the work. Had the plaintiff made good the defective work, he (defendant) was willing to settle the account. He contended he was entitled to have an allowance of £16 3s. made to him by the plaintiff for defective work. He also complained of an overcharge of £2, in respect of workmen's time.—The jury found a verdict for the plaintiff for the amount claimed, £18, and also on the counterclaim.

### AN ELECTRIC RAILWAY CARRIAGE.

At the Gloucester Railway Carriage and Wagon Company Limited's Works the lightning express railway carriage (Behr's patent), which has been constructed for working at the forthcoming Brussels International Exhibition, was recently inspected. The carriage, which is self-contained and propelled by electricity, runs on one rail; the passenger compartment is about 60ft. long, and will seat 100 persons. It is constructed in a continuous length, so that while the under-carriage, being in two parts, is free to take the curves, the top carriage is always straight, and the ends are pointed to lessen air resistance. The floor of the carriage is about 6ft. above ground, and the carriage is divided into four compartments, and lighted by electricity. There is a patent air-brake, as well as a hand-brake, and the driver has these and the switch immediately under hand. It is proposed to run the carriage at first at the rate of 120 miles per hour, but it is said that a much higher speed can be attained.

### NOTTINGHAM RAILWAY WORKS.

The schemes of both the Manchester, Sheffield, and Lincolnshire, and the Great Northern Railway Companies, so far as they affect Nottingham, are progressing rapidly. Just at present the area between Cairns Street and Charlotte Street, which is to form a portion of the yard of the new central station, is being excavated by means of a steam navvy, and the earth is taken through the Mansfield Road and Sherwood Rise tunnels out to the valley of the Day Brook, there to be utilised for the purpose of the connection between the Great Northern Company's Derby line, and the M., S., and L.'s extension to London. The huge piece of ground lying south of York and Charlotte Streets will shortly be treated similarly, for a depth varying from 58ft. to 27ft. has to be reached ere the station platforms can be built, and the permanent way laid. The commencement of the work which is necessary to connect the station site with the covered way in Thurland Street—a heavy task—is postponed for the present, but from the latter thoroughfare it will in a few days become possible to lay a contractor's road out on to the viaduct, and thence to the Meadows, where the goods yard and sidings are to be situated. Most of the steel work in that stretch is completed. Close to the banks of the Trent the contractors' labourers have during this week started to

excavate for the foundations of a large engine-shed. The Great Northern Company's work is being pushed on with rare vigour. Much of the brickwork has been put in between Narrow Marsh and London Road, but no progress has as yet been made between Popham Street and Leen Side. The viaduct which will connect with the M., S., and L. at Middle Hill, is on a very sharp curve. South of London Road, to Meadow Lane, where much heavy engineering work, in the fixing of girders and cylinders, awaits the contractors, nothing has at present been done, the reason being that the Company's Bill, authorising alterations in the original plan, has not received the Royal assent yet.

#### IMPROVED METHOD OF PAVING.

Messrs. London and Hobbs have patented an improved method of granite-paving with the object of lessening or deadening the sound. Instead of the ordinary plan of setting the granite blocks on a solid and rigid foundation, and filling the spaces between each stone with hard and unyielding gravel, the inventors use any suitable and inexpensive fibrous material, such as peat moss, jute, manilla, flax waste, spent bark from tanneries, or the like, and lay this on the foundation and between each stone. The paving is laid on about two inches of fibre, and a small quantity of bitumen is poured into the spaces to steady the blocks for ramming. After this process, which compresses the padding material to about one inch in thickness, fibre is swept in between the blocks, and more bitumen poured in to complete the filling. Each stone is thus surrounded with a non-conductor of sound, entirely preventing that reverberation which is so inconvenient and annoying in relation to the usual method. Part of a street in New-castle-on-Tyne (the Pilgrim Street end of High Bridge) has been laid by the city Surveyor, and is said to be quite effective. Mr. Boulnois, city engineer of Liverpool, in his work on the construction of carriageways, describes the many advantages of granite set pavement, but he is obliged to add that the noise is undoubtedly very excessive. Now that this difficulty is to a great extent overcome, this invention should be welcomed by surveyors, as it enables them to use more freely a material which has the longest life of any pavement yet discovered. Peat is the fibre most preferred, because it is not liable to decay, and is not injuriously affected if any moisture finds its way between the blocks. The patentees point out that the invention is further applicable to railway purposes, as, for instance, for deadening the sound of railway trains over, under, or alongside public streets or thoroughfares; in which case it is proposed to insert the material either between the rail-chairs and the sleepers, or on the under side of the sleepers (to which it may be cemented), or at some point underneath the sleepers in the ballasting of the line, so as to intercept and neutralise the conduction of noise caused by trains, besides causing the motion to be much smoother owing to the absence of concussion, the wear and tear being thus lessened.

#### CARPENTERS' AND JOINERS' UNION.

The General Union of Carpenters and Joiners has recently been showing activity in the Manchester district. According to the monthly report of Mr. C. Matkin, the organiser, there are fifteen lodges of this union in the Manchester, and three in the Stockport districts. During February 129 members joined this Society, Lancashire heading the list with 53, against 31 for London, only three for Yorkshire, and 16 for Warwickshire. A correspondent says he cannot imagine what the non-union joiners are thinking about. "Here is a revival of trade, and wages are going up all round, and yet they will not take the one means of improving their position."

#### A BUILDING CASE.

At the Manchester County Court, Frederick Rowbottom, builder and contractor, 21, Nelson-street, Lower Broughton, claimed £41 odd from a Mrs. Fletcher, of Wigan, for work done and goods supplied.—It appeared that the defen-

dant, who keeps a public-house in Wigan, engaged the plaintiff in May of last year to build a wall and put up some stone pillars opposite a row of cottages at Walthew-lane belonging to her. The contract was a verbal one, to the effect that plaintiff should put in "the best stone that money could buy," and that the wall was to be built with bricks of good quality. Plaintiff was to "clear up" after he had finished, and was to receive £52 for the job when it was completed. He commenced upon the work, and was getting well on with it when in unloading one of the pillars fell and was broken. The defendant upon this suggested that the stone being used was not of the character being contracted for, and stopped the job. Negotiations in the matter coming to nothing, plaintiff eventually sent in his bill for the amount claimed.—The plaintiff did not contend that the stone was "as good as money could buy." That was not contracted for. The stone, however, was of a good class, and suitable for the work.—Plaintiff said no particular quarry was specified; he ordered it from a well-known firm of builders' merchants. They were "York posts" of medium quality, not very hard or soft. A piece of granite of the size might have broken had it been dropped. He told defendant there were hundreds of houses of a better class than hers fitted with the same stone.—Mr. Beaumont, a Manchester Architect, said he would not have passed it as the best York stone, but it was fit for the work.—The judge said he was satisfied that plaintiff had contracted to supply the best stone, and had not done so. Judgment was therefore entertained for the defendant with costs.

#### EMPLOYER'S LIABILITY: UNSUCCESSFUL CLAIM AGAINST BUILDERS.

At the Brompton County Court last week, Walter Bell, a Kilburn bricklayer, sued Messrs. Langdale, Hallett, and Co., builders, of 122, Brompton Road, S.W., for £55 damages for injuries received whilst in their employ. The action was brought under the Employer's Liability Act.—Mr. H. T. Kemp, for plaintiff, said the accident occurred on August 17, at the Coburg Hotel, Mount Street. Plaintiff was on a plank cutting a hole in the ceiling at the basement of the hotel. The plank rested at one end on a pair of steps, whilst the other end was inserted in the noose end of a rope attached to a pipe in the ceiling. Suddenly the plank collapsed, and plaintiff fell a distance of 6ft. His injuries debarred him from work for ten weeks, for which he claimed £20, the doctor's bill amounting to £10 10s., and the balance of the claim was for pain and suffering.—Plaintiff corroborated the statement of counsel, and Dr. Evans, of Kilburn, gave evidence as to plaintiff's injuries.—For the defendants, Mr. Salter contended that his clients were not responsible. The scaffold in question was erected by Messrs. Fenn, who were putting in speaking tubes, and plaintiff received his orders from Messrs. Fenn's foreman.—Arthur Storey, foreman to Messrs. Fenn, said the plank in question was only put up to support some pipes. There was a scaffold close by to work on. Witness did not tell Bell to work on the plank. He did not see him on the plank, but it was possible for him to have one foot on the proper scaffold and one on the plank.—Daniel Wallace, defendants' foreman, said that he gave plaintiff instructions to assist Messrs. Fenn's men, and he would have to do as they told him.—The jury gave a verdict for defendants and judgment was entered accordingly.

#### JOHN P. WHITE.

We have just received from Mr. John P. White, of the Pyghtle Works, Bedford, a copy of his latest catalogue, containing illustrations of some very strikingly artistic Designs in wood chimney pieces. Their wealth may be well understood when we state that such Artists as C. F. A. Voysey, C. B. Quennell, and George Jacks have worked out the Designs. The catalogue contains two or three illustrations of Voysey's work, and includes a mantel designed for covering the whole of the chimney breast, with the shelf returning round

angle up to the wall, with a top centre panel well adapted for taking a mirror, a chimney piece in pine, with carving of St. George and the Dragon omitted, and which can be rearranged to suit any house, and, lastly, a very simple but effective Design in oak, with the carving of frieze from the full-size drawing of the designer. Mr. C. B. Quennell's Designs include a very elaborate chimney piece, which can be made in any wood, and painted any colour to suit character of residence, and which, with a 24in. brass interior, white and blue Dutch tiles, and Cipallino marble slips, is very beautiful, and a chimney piece the side jambs of which can be made to open, and used as a small cupboard, shelved all the way up, left open, with shelves at either front or side, or boxed solidly. Two notable Designs by Mr. Jack are illustrated, G. Le Morris and W. R. Lethaby being among other designers whose work is so beautifully interpreted by Mr. White. A speciality turned out from the Pyghtle Works is the "Portcullis" fire screen and blower, which has been brought out to supply the need of an arrangement for masking a fireplace when not in use. It serves that end admirably.

#### KEYSTONES.

The building of a chapel on a site purchased in 1894 in Ann's Road, Heeley, has been vigorously pushed forward. The cost of the scheme when completed will be £5000.

The Links and Parks Committee of Aberdeen Town Council has decided to recommend that the bathing station be considerably extended. The cost of the additions is estimated at £6000.

The opening of the new fire station at Chester Street, Aston, took place on the 22nd inst. The new buildings provide double the former accommodation, and the whole of the engines and other appliances are under cover. The total cost of the alterations has been £1000.

The Markets Committee of the Wolverhampton Town Council is considering proposals to rearrange the stalls in the Market Hall, and carry out much needed improvements in the Cattle Market. It is estimated that this will involve an expenditure of between £7000 and £8000, and the committee has practically decided to ask the Council to sanction the expenditure.

A NOVELTY in railway carriages will shortly be placed on the Belgian lines. This is a wagon-hospital, fitted up, as its name implies, for invalids, and containing twenty-four beds upon wire springs, and various surgical and medical appliances. An unusual feature is a little chapel attached to the carriage, where special permission has been obtained from the Pope to celebrate mass.

The Engineers of the Northern Lighthouses Commissioners are at present engaged in surveying the ground at Blackhead, three-miles north of Portpatrick Harbour, where it is proposed to erect a new lighthouse and fog-signal station for the Irish Channel to serve as an intermediate light between Corsewall Point and the Mull of Galloway, the lighthouses of which are twenty-five miles apart.

A NEW Royal train of six carriages is now in course of construction at Swindon, and its elaborate internal and external decoration is engrossing the attention of some of the most expert artists employed by the Great Western Railway. The only wood used throughout is mahogany of the finest quality, and the doors of the Queen's carriage are so contrived as to allow of the entrance of two attendants, one at either side of her Majesty.

WHILST workmen in the employ of the Chatham Corporation were engaged in excavation work recently, they discovered two human skeletons and some Roman pottery. The remains are believed by Archaeological experts to belong to a date early in the period of the Roman occupation of this part of Britain. The pottery found includes urns and a number of beautifully-shaped earthenware bottles. One is a bright red with white enamel spots, while another is ornamented with white scroll-work.

## SOCIETY MEETINGS.

**Devon and Exeter Architectural Society.**—A lecture was recently given in the Athenæum by Mr. Charles Cole (President of the Exeter Camera Club) on Architectural Photography. A preliminary description of the camera was given, with hints upon its manipulation, especially with regard to the lines and planes of buildings. The lecturer advocated making photography at once a handmaid of Architecture as well as a companion, for it gives the Architect immense facilities for studying the buildings of other countries, and delineates faithfully examples of both ancient and modern work. Also that not only the old buildings would be kept in mind for those who follow us—and surely this is legitimate work for the Architect—but that we should hand down pictures of how we live and what our streets look like now, together with the dress of the people and street trades and sights. The use of the camera in cases of easement was shown. In regard to sketching and kindred matters, he did not think the camera should take the place of sketch blocks and pencil; but they might be used in conjunction. To sketch well is for Architects a necessity; there is no doubt that some possess the faculty more than others, and every Architect amongst his other requirements should have an intuitive love for and a knowledge of where to look for the beautiful. He claimed for photography if used aright, and with an earnest desire to turn out good work, the operator will naturally turn to picture making, and herein is a great field of learning. He must possess and train the faculty of Artistic sight, and pictures are to be found in everything and amidst most unpromising surroundings.—A large number of lantern slides were shown on the screen. These had been made by the lecturer, several of them being from negatives taken for the photographic survey of Exeter, which was begun some time ago. In addition to photographs of buildings, the slides showed some very beautiful pictures of wood and water, also cloud effects, as well as records of the blizzard.

**British Archæological Association.**—The eighth meeting of the session was held on March 17th, at the rooms in Sackville Street, Mr. C. H. Compton, V.P., in the chair. The Hon. Sec. announced that it had been decided to hold the Congress this year at Conway upon the invitation of the Mayor and Corporation. Mrs Collier read an interesting paper upon the church and painted glass at Bowness on Windermere, which edifice she said, appeared not to have received as much notice from antiquaries as it deserved. The church is dedicated to St. Martin but the actual date of its erection is not recorded. It is a very ancient structure, and some of the materials employed in its construction have been traced to Roman origin, and were probably brought from a Roman station which is known to have been established in the neighbourhood. Like most of the churches in the Lake district, it is simple and rudimentary in construction, consisting, until the recent additions of a nave and aisles, of a chancel and a low square embattled tower at the west end. The principal entrance is by a porch in the south aisle, but there is a narrow arched door at the east end of the same aisle, and a similar one at the west end of the north aisle. The East window is of late perpendicular work, without tracery or other enrichment, and the arches, capitals, and bases of the columns are equally devoid of all ornamentation, and until recently were covered with successive coats of whitewash. St. Martin's was anciently a chapelry in the Parish of Kendal some miles distant, and though now a separate parish, the Rector of Bowness stills pays a pension of 13s. 4d. to the Vicar of Kendal in token of submission to the Mother Church. In the year 1864, some curious inscriptions and texts were accidentally discovered painted on the walls beneath the coats of whitewash. They consist of quotations from Robert Openshaws Catechism, and relate to the Sacraments of Baptism and the Lords Supper, and belong to the age of James I. The chief feature of

interest in the church is the painted glass in the East window, which was brought into prominent notice during the progress of restoration in 1873. This glass is considered by competent authorities to date from about the year 1480, and to have been originally in the Priory of Cartmell near Grange, whence it was removed to Bowness about 1523. A second paper was read by Mr. Geo. Patrick, Hon. Sec. in the absence of the author, Mr. H. Syer Cuming upon "Mead and Mead Vessels." The author traced the origin of the beverage known as Mead or Metheglin, so much appreciated by the Britannie tribes and the Teutonic nations, from the Hydromel of the classic age, and brought its history down to the latter part of the last century. Pliny knew it and called it a lime made solely of honey and water, rain water after being kept for five years being best for the purpose, though some he says, boiled down fresh rain to one third of the quantity gathered, to which they added one third in quantity of old honey and kept the mixture exposed to the rays of a hot sun for forty days after the raising of the dog star. Sometimes it was raked off in the course of ten days and preserved in vessels tightly stopped. The vessels in which the Metheglin was stored, and in which it was brought to table were particularly described, and drawings illustrative of examples of Mead cups and pots, several of which are in the author's collection were exhibited. These vessels are reported to have been in early ages amongst the Celtic chieftains of gold and silver, and jewelled, as well as of glass, but those which have come down to our days are made of various wood, wrought out of single blocks of beech, oak, elm, pine, walnut, willow, sycamore, and yew, sometimes ornamented with incised lines and some bearing dates and initials. They were called Meadars or Methars, and the author considered that the famous Dunvegan cup in the Isle of Skye, was only an oaken methar of bizarre design mounted on four silver legs, and he believed its antiquity must be brought down from the tenth century to the end of the fifteenth century. Both the papers were illustrated and elicited much discussion.

**The Institution of Naval Architects.**—At the annual spring meeting of the Institution of Naval Architects twelve papers will be read, the number being divided equally between four sittings. The meeting commences, as usual, on the Wednesday of the week preceding Easter. On the second day, Thursday, the 8th April, there will be both a morning and evening sitting, but on the Friday there will only be a morning sitting. Water-tube boilers hold the place of honour in the agenda; both Admiral Fitzgerald and the Engineer-in-Chief to the Royal Navy contributing on this subject. Lord Charles Beresford, on the Thursday morning, will read a paper on the value of the older iron-clads, if re-armed. The following paper is to be contributed by the Hon. Charles A. Parsons, and will deal with the application of the compound steam turbine to marine propulsion. Mr. Macfarlane Gray has two papers down for the Thursday evening, and may be trusted to give interest even to such subjects as "the Accelerity Diagram" and the "Geometry of Stability." Professor Lewes supplies the remaining item in the programme, a paper on "Acetylene Afloat." "Nickel steel for boiler sheets and forgings," by Mr. William Beardmore; a paper on "Stability," and another on the "Use of the mean water-line in design," by Mr. A. G. Ramage, and a paper on "Electrical transmission of power," by Herr von Kodolitsch, are the remaining contributions.

**National Registration of Plumbers.**—Under the auspices of the District Council for Edinburgh and the East of Scotland of the National Registration of Plumbers, a lecture on "Water Hammer in Pipes" was recently delivered by Professor Stanfield in Heriot-Watt College, Edinburgh. He began by defining potential and kinetic energy, and showed that water might possess one or both of these kinds of energy. A mass of water moving with a certain velocity possessed a definite amount of kinetic energy, and to reduce this to rest required the application of force. The degree of force depended upon the time occupied in bringing it to rest. He showed that in a steam pipe a

mass of water might possess such a large quantity of energy as to produce a force sufficient to fracture the pipe. The same sort of action might take place in pipes supplying mines with high pressure water. The useful application of the kinetic energy of water was shown in the hydraulic ram, which was capable of raising water to a higher level than that from which the water flowed. The lecture was explained throughout by illustrations and experiments, showing the principle of the hydraulic ram and the effect of the water hammer in pipes.

Forty-four persons have given £1000 each to the building fund of the new Catholic Cathedral at Westminster.

A new school-chapel has been opened at Bury. The building, which will accommodate 485 adults, has been erected at a cost of £1350.

The Glasgow citizens have agreed to commemorate the Queen's reign by largely reconstructing the Glasgow Royal Infirmary. The Lord Provost announces that subscriptions amounting to £15,000 have been promised.

## CONTRACTS OPEN.

## THE URBAN DISTRICT COUNCIL OF WOKING, SURREY.

## MAIN DRAINAGE, CONTRACT No. 1.

The Council are prepared to receive TENDERS for the CONSTRUCTION OF WORKS, consisting of 29 miles or thereabouts of SEWERS of CAST-IRON, CONCRETE and STONEWARE, ranging in diameter from 30in. to 8in.; also of 473 MANHOLES, LAMPPOLES, and FLUSHING TANKS upon the lines of Sewers; also of 5 miles of CAST-IRON POWER MAINS of 3in., 4in., and 5in. diameter; also of FOUR AUTOMATIC PUMPING STATIONS; also of the SETTLING TANKS, MAIN PUMPING STATION, ROADS, FENCING, and other WORKS at the proposed Outfall at Woking Park.

Plans and sections of the undertaking may be inspected at the Offices of the Engineers, Messrs. JOHN TAYLOR, SONS, and SANTO CRIMP, 27, Great George-street, Westminster, from whom copies of the specification and bill of quantities may be obtained upon the deposit of Five Guineas (cheque only), which will be returned upon the receipt of a bona-fide Tender.

Sealed Tenders, endorsed, "Main Drainage," and addressed to the Clerk to the Urban District Council of Woking, must be delivered at the Offices of the said Council before NOON on THURSDAY, the 22nd day of APRIL, 1897.

The Council does not bind itself to accept the lowest or any Tender.

Woking,

ROBERT MOSSOP, Clerk.

March 13, 1897.

## TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ERECTION of a NEW POST OFFICE at West Hartlepool.

Drawings, specification, and a copy of the conditions and form of contract may be seen on application to the Postmaster.

Bills of quantities have been prepared for the use of builders by Mr. F. H. A. HARDCASTLE, of 5, Old Queen-street, Westminster, and, together with forms of Tender, may be obtained at the undermentioned office on payment of One Guinea.

The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon, on FRIDAY, 2nd APRIL, addressed to the Secretary, H.M. Office of Works, &c., 12, Whitehall-place, London, S.W., and endorsed, "Tender for West Hartlepool New P.O."

RÉGINALD B. BRETT,

H.M. Office of Works, &c.,

Secretary.

March 10th, 1897.

## TO BUILDERS.

The Commissioners of H.M. Works and Public Buildings are prepared to receive TENDERS for the ERECTION of a NEW POSTMEN'S OFFICE at Walworth, S.E.

Drawings, specification, and a copy of the conditions and form of contract may be seen on application to Mr. H. TANNER, No. 15, Whitehall-place, S.W.

Bills of quantities have been prepared for the use of Builders by Mr. C. W. STEPHENSON, of 38, Parliament-street, S.W., and, together with forms of Tender, may be obtained at the undermentioned Office on payment of One Guinea. The sums so paid will be returned to those persons who send in Tenders in conformity with the conditions specified below.

The Commissioners do not hold themselves responsible for the accuracy of the quantities, nor do they bind themselves to accept the lowest or any Tender.

Tenders are to be delivered before TWELVE o'clock noon on TUESDAY, 6th APRIL, addressed to the Secretary, H.M. Office of Works, &c., 12, Whitehall-place, London, S.W., and endorsed "Tender for Walworth Postmen's Office."

RÉGINALD B. BRETT,

Secretary.

H.M. Office of Works, &c.,

March 17th, 1897.

ADCOCK, Mr. W. J., Builder, Dover.

"I have proved your invention easy of application. Both my joiners and apprentices could fix the apparatus without difficulty after having inspected a model."

CRICKMAY & SONS, Messrs., F.R.I.B.A., London, S.W.

"The Patent Windows supplied for Sir Edward Walters' house at Salisbury gave us every satisfaction. We shall continue to use them."

JONES, Mr. PETER, Sloane Sq., London.

"I am glad to be able to bear testimony to the great utility and general usefulness of the N.A.P. Sliding Windows. I am very pleased with them, and should be sorry to be without them."

LUCAS & AIRD, Messrs., Contractors, London.

"Cheap, simple, and effective. We are using some 1200 sets of your fittings on these exceptionally tall buildings."

MORGAN, ISTD & MORGAN, Messrs., Contractors, Southampton.

"A very clever arrangement, and one which will certainly come into daily use."

PERRY & READ, Messrs., F.R.I.B.A., London.

"It is with pleasure that we are able to inform you of our entire satisfaction with the 'N.A.P. Windows,' we shall continue to

specify them."

# HACKNEY UNION.

REPAIRS to the CHIMNEY STACKS and VENTILATING FLUES.

The Guardians of this Union invite TENDERS for REPAIRING the CHIMNEY STACKS and VENTILATING FLUES of the Old Pavilion at the Hackney Union Infirmary, situate at Homerton, in the County of London.

Persons desirous of Tendering may obtain an order to inspect the premises, see the conditions of contract, and obtain specification and the form of Tender, by applying to me, between the hours of TEN and TWELVE in the forenoon. No quantities.

The contractor will be required to give approved security for the due performance of the contract.

Sealed Tenders, endorsed "Chimney Stacks and Ventilators," must be delivered at my Office not later than HALF PAST TWO p.m. on WEDNESDAY, the 31st day of MARCH, 1897.

The Guardians do not bind themselves to accept the lowest or any Tender.

By order,

FRANK R. COLES,

Clerk to the Guardians.

Clerk's Office, Hackney Union,  
Homerton, N.E.

March 15th, 1897.

32, Norton Folgate, E.C.

Mr. LEWIS ANGELL, Engineer to the Corporation, Town Hall, Stratford, E., on the deposit of a £5 Bank of England Note, which will be returned on the receipt of a bona-fide Tender.

Tenders, endorsed "Tender for Buildings," to be sent to my Office not later than FOUR o'clock on TUESDAY, APRIL 13th, 1897.

The Council do not bind themselves to accept the lowest or any Tender.

The contractor will be required to enter into a bond, with two sureties, for the due performance of the contract, and no work will be ordered under the contract until such bond has been duly executed.

The contractor whose Tender is accepted, and with whom a contract is entered into, will be required to pay to the whole of his workmen such rate of wages and observe such hours of labour as are recognised by the workmen's trades unions and in force at the time of signing the contract.

In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,

FRED. E. HILLEARY,

Town Hall,

West Ham, E.

March 9th, 1897.

Town Clerk.

# TO CONTRACTORS.

Persons desirous of TENDERING for the ERECTION of a CHURCH, VICARAGE HOUSE, and STABLES at Newport, near Howden, East Yorks., can send in their names to us, and deposit £1 15s. at our Offices.

Bills of Quantities and further particulars will be sent to such depositors only, and the deposit returned on receipt of a bona fide whole Tender.

The lowest or any Tender not necessarily accepted.

SMITH, BRODRICK, AND LOWTHER,  
York Chambers,  
77, Lowgate, Hull.

Architects.

# TENDERS.

Information from accredited sources should be sent to "The Editor." No results of tenders can be accepted unless they contain the name of the Architect or Surveyor for the Work.

GUARANTEE sent with each Basin.

Recommended and Specified by Architects & Sanitary Engineers.

Perfect Sanitation, Healthy Houses

OBTAINED BY ADOPTING THE

# "TWYCLIFFE" Patent Pedestal Syphon W.C. Basin.

A new Departure, embodying the latest developments in Sanitary Science, as applied to W.C. Basins.

Advantages claimed for the "TWYCLIFFE" Syphon:

Perfect safeguard against sewer gas and the evils arising therefrom.	Practically noiseless in action.
Extra large water surface and great depth of water seal (3 inches) and large body of water in Basin to receive and deodorise soil.	Simple in construction, reliable in action.
	No complicated mechanism to get out of order.
	Easily fixed as an ordinary Basin.

High-Class Article of Superior Material, Workmanship and Construction.

TWYFORDS, Ltd., Cliffe Vale Potteries, HANLEY.

# ECONOMY IN BUILDING.

# Surveying and Sanitary SUPPLEMENT.

MARCH 31ST, 1897.

## WORKHOUSE PLANNING.

By GEORGE H. BIBBY, F.R.I.B.A.

### III.—VAGRANTS' WARD.

THE buildings to be provided for vagrants are always required for more males than females, and for only limited numbers of children; and whether or not all these be habitual or casual applicants for relief, in erecting wards for vagrants we must remember that there is a large class of persons in existence who are firmly determined to make undue

pected; the associated wards, being very much less expensive to build, would be suitable for an occasional excess of vagrants. It has also been suggested that, where associated wards are chiefly provided, a few separate cells or wards may be conveniently provided for those vagrants for whom, from their habits and manners, isolated accommodation is desirable; where the separate-cell system alone is adopted it is necessary to arrange for a suitable day-room, which may also serve (during periods of pressure) as an extra dormitory for vagrants when the usual dormitories and cells are fully occupied.

While the Local Government Board requires that the ordinary receiving wards shall be

as to accommodate women with children, the length of the compartments should be 6ft. 6in. for males and 6ft. for females; stout canvas or cocoa-nut matting bound with leather forms excellent and cheap material for hammocks." The particulars of the accommodation required for vagrants are in many respects much more precisely stated by the Local Government Board than for other departments of workhouses, and this cannot be a matter for surprise if the various descriptions of vagrants be fully considered, as well as the circumstances of bodily health or moral character under which they seek the temporary shelter of workhouses.

The Local Government Board disapproves of

use of institutions which are intended mainly for cases of unavoidable destitution; such applicants for shelter and food require, therefore, to be dealt with sternly, and to be set to work until they have repaid for their maintenance.

For this object it is frequently considered desirable to arrange the wards on the separate-cell system, or upon a plan which will combine both associated wards and separate cells, as suggested by the Local Government Board, but the separate-cell system (being certainly more costly of construction) would be utilised for the ordinary number of vagrants to be ex-

10ft. in height and have an allowance of 40ft. of floor space to each bed, the associated vagrant wards must be 12ft. in height and 18ft. in width, and a note is made, that "where ordinary bedsteads are not used, the wards should be fitted with sleeping platforms or hammocks, the former being made of planks, either movable or otherwise arranged so as to allow of cleaning, the floor beneath the platforms should be divided into compartments 3ft. wide in the clear by boards 12in. in height above the level of the pillows, every alternate division in the female ward being made capable of removal by the attendant so

vagrants being made to sleep upon the floor, and the regulations above-mentioned are intended to suggest a means for preventing any necessity for this undesirable arrangement, which is, however, still practised (or was recently) in at least one large and overcrowded institution, and may be in many others.

In those workhouses where the vagrants are provided for on the separate-cell system, two sizes of sleeping cells should be arranged for. The ordinary cell (for men or women) must have minimum dimensions as follows, that is, a width of 4ft., average height 10ft., floor space 36ft., and a cubic space of 360ft.; but a

separate sleeping-cell for women with children must be somewhat larger, and have a minimum width of 5ft. 6in., an average height of 10ft., a floor space of 54ft., and a minimum cubic space of 540ft.

Therefore, the dimensions of ordinary vagrants' cells may be as follows, 8ft. by 4ft. 6in. by 10ft., and for women with children, 8ft. by 6ft. 9in. by 10ft., these being the figures approved by the Local Government Board.

These figures show that the minimum accommodation for vagrants compares very unfavourably with that required to be provided for the patients of lunatic asylums for paupers when located in single-rooms (the word "cell" is quite discarded in modern asylums) for even the clean and healthy patients kept in single rooms in these institutions must each have not less than 63 superficial feet, while the apartments for the sick and infirm must be one-third greater.

The day-rooms for workhouse inmates in health may, according to the regulations of the Local Government Board, provide a minimum of 15ft. per person of floor-space; this also is much less than the minimum of floor-space in day-rooms in asylums under the control of the Commissioners in Lunacy, who require that each person shall have a day-room floor-space of not less than 40ft., while the authorities in Ireland require that asylum day-rooms shall have a floor-space of 30ft. per patient, or double the minimum for workhouses; for these and kindred reasons the cost of asylums is much greater per patient than of workhouses.

In Fig. 4 is given the ground plan of a workhouse building (of one story) for vagrants, in which both the separate-cell and associated dormitory systems are combined.

The whole arrangement is assumed to be within the outer fences of the workhouse, and these wards for vagrants would be approached by a covered way at A leading from the porter's office and main entrance.

One of the first necessities upon the arrival of a vagrant is to disrobe him and disinfect his clothing; for this purpose the infected clothing would be received in the apartment marked B, from thence passed into the disinfectant at C, and taken out disinfected at D; the vagrant is provided with a bath, lavatories, closets and urinals at F, G, H, which are all near to the entrance at E (where the lobby forms a means for cross ventilation between the sanitary annexe and the vagrant's apartments), four sleeping cells are provided at J J J J, while the labour cells adjoin at K K K K, these labour cells have shoots for broken stone, &c., at L L L L (see both plan and section), the day-room is shown at M, and the associated dormitory at N is for twelve inmates, the whole block thus providing for sixteen male vagrants of two classes. Should there be a pressure for space at any time additional beds would probably be supplied in the day-room, both dormitory and day-room are in close connection with the attendants' room at O. At P is provided a closet for patients' clothes, and the covered way at Q affords a means of exit for vagrants when discharged from these wards. The stone-breaking shed is at T, with five spaces or bunks 6ft. deep by 4ft. broad, the divisions between each being about 5ft. in height.

With regard to the provision here shown for bathing the vagrants, and for the supply of hot and cold water, the regulations of the Local Government Board permit that when the total number of vagrants of both sexes is limited, one bath room will suffice, but in such cases there must be separate and proper means of access for males and for females; with larger numbers than eight vagrants, two bath-rooms are frequently provided, but although this is in accordance with the Local Government Board suggestions, yet in many districts one bath-room to every eight vagrant would appear to be an unnecessary expense; the Board has also suggested that the apparatus for heating the water for the baths "may conveniently be arranged so as to warm the cells by means of distinct pipes in connection with the boiler. These pipes should be carried through each cell about six inches above the floor near the external wall, so as to warm the

air admitted by the air bricks, and should have a suitable valve or stopcock for shutting off the hot water from them when not required." The Board recommend that lavatories should be provided in the same proportion as suggested for the baths, but this I consider insufficient and would at least provide double the number of basins.

The plan shown in Fig. 4 is arranged in compliance with a suggestion of the Local Government Board which states that "in the case of cells they should be arranged on one or both sides of a corridor, which, though enclosed, should be thoroughly well ventilated by means of louvres in the roof and windows where practicable. This corridor, which should communicate with the bath room, attendants' room, etc., must, if there be cells on both sides, be at least 4ft. wide, and if on one side only, at least 3ft. 6in. in width, the opposite end wall of the cells is required to be either partially or wholly an external wall, in order that air bricks and windows, or ventilating gratings, may be inserted in it."

Some of the requirements of the Local Government Board, with regard to the structural details of the buildings to be provided for vagrants, appear to demand some modification, especially those having reference to ventilation, as may be gathered from the following extract: "The simplest method of obtaining constant through ventilation at night, is to provide an air-brick in the external wall of each cell at the floor level, and a grating at least 12in. by 9in. high up in the corridor wall. The air-bricks should be covered on the inside with finely perforated zinc, and in order to break the force of the wind in exposed situations, the inner opening should be placed either above or below, or to one side of the outer one; in order that the cells may be thoroughly well aired during the day time in all weathers, a swing window 18in. by 24in. should be provided high up in the external wall of each cell, the fastenings of these windows should be under the sole control of the attendants, the windows being opened only when the cells are unoccupied. Where the number of sleeping cells is considerable, the windows should be arranged so that several of them may be opened or shut simultaneously, by means of a rod with a crank attached to each sash. When there exists any strong objection to the small windows above recommended, the cells may be lighted by means of fixed skylights or glass slates; but ventilating gratings, at least 20in. by 15in., must then be provided in the external wall in place of the windows; the gratings must be capable of being closed at night; ventilating skylights are objectionable, as they cannot be opened in wet weather and are rarely watertight when shut." I have already shown that the cubic spaces to be provided in the cells for vagrants is but very limited, the minimum being 360ft. for ordinary cells and 540ft. for the cells for women with children; therefore the openings for ventilation purposes, as proposed by the Local Government Board, appear to be of excessively large dimensions, and the suggestion that when the number of cells is considerable, that several of them be open or shut simultaneously by means of a crank or rod arrangement, would frequently operate harshly upon those of the vagrants whose condition of health is likely to cause them to be greatly susceptible to a cold temperature of the atmosphere, but in those portions of a workhouse where a rod-action for the opening of windows is required a suitable apparatus is manufactured (for workhouse purposes) by Messrs. James Hill and Co., of 100, Queen Victoria Street, E.C., Mr. George Wragge, of Salford, Manchester, and Messrs. W. and R. Leggott, Limited, of 226, High Holborn, W.C., which can be so arranged as to be beyond the risk of interference from the pauper inmates (an important point in workhouse construction).

Wooden partitions between the cells of the vagrants' wards are not, under any circumstances, allowable; the division walls must certainly be sufficiently thick to prevent communications between the vagrants, and should therefore be of brickwork.

Open fireplaces, in the day-rooms for vagrants, are undesirable for various reasons, one of which is that the stronger and more

selfish inmates would probably endeavour to monopolise the fires and exclude the weaker, and much trouble would be caused to the attendants in keeping order, a condition of affairs easily avoided by providing a suitable heating apparatus.

For those vagrants who are confined in separate cells special arrangements as to water-closets, etc., are requisite, or otherwise it would be necessary for the attendants to conduct the vagrants to the closets whenever required; the Local Government Board suggest that the best method of meeting this requirement is to provide in each cell an inexpensive sealed night stool, earth commode, or other approved contrivance of the kind (but not a w.c. apparatus), for the emptying and cleansing of these of course a suitable place must be provided. This mode of dealing with the question has many obvious disadvantages, but appears to be the best under existing circumstances.

In the room appropriated to the attendant upon the vagrants a bell should be fixed, and in each cell or ward should be a pull, with indicators to show who may require attention from the attendant.

The female vagrants are frequently employed in cleaning the cells, bath-rooms, etc., and are also employed in picking oakum—this work may be performed in their cells.

With regard to the provision to be made for the drying and disinfection of the vagrants' clothes, many arrangements are before the public, some of these are by the action of air at a dry heat of 250° F., or by the action of steam, or by a combination of these means, or the clothes may be dried in the ordinary manner and be then disinfected by fumigation with burning sulphur. Amongst the firms who manufacture disinfectors are Messrs. Clements, Jeakes and Co., Great Russell Street, W.C., Messrs. A. M. Perkins and Son, Limited, 43, Regent Square, W.C., Messrs. W. Summercales and Sons, Limited, of Keighley, Messrs. Benham and Sons, Limited, London, W., and Messrs. Frederick Dye and Co., of St. Paul's Churchyard, E.C. In large workhouses each of the larger sections of the institution might conveniently have its separate disinfecting apparatus; in selecting a system many considerations must be thought out, and the facts of economical supplies of gas or steam existing in the workhouse may influence the final decision.

With regard to the proportion of separate cells to be provided in the vagrants' buildings, it is interesting to note that the whole question of locking up vagrants in solitary confinement has not always found favour in the eyes of magistrates and others, especially in those cases where tramps have been liable to be detained beyond one or two days; the reason for placing the labour cells so as to be immediately approached from the sleeping-cell is to save the attendant from the trouble of transferring the vagrants from one cell to another by way of the corridors. Every vagrant who is found to be in good health must be given employment, unless he be in other respects incapable, and it is desirable that the vagrant's buildings should be planned conveniently for the purpose, for it is frequently found difficult to compel vagrants to perform their tasks, even when these are moderate and the buildings are conveniently arranged for the purpose.

The floors of the vagrants' wards should be at a level of not less than one foot above the ground level generally. The Local Government Board has suggested that the day-room for vagrants should be formed of concrete, finished in cement, or that it might be asphalted, paved with quarry tiles or flagging; the walls of brickwork would be limewashed on their internal face, plastering not being considered necessary.

In any case it is desirable that the buildings and workyards for vagrants should be as far away as can be conveniently arranged from the wards for children and the sick and infirm.

(To be continued.)

A NEW museum is to be erected in Berlin at a cost of nearly six million marks.

# Building Trades Exhibition.

## SECOND NOTICE.

THE Building Trades Exhibition for 1897 concluded on Saturday night. It was a record Exhibition, and for many years it must stand prominently forward in the list of future successes which are now confidently looked forward to. In our last issue we noticed a great number of the stands, but those who visited the Agricultural Hall during last week will at once recognise the impossibility of doing justice to the Exhibition in a single issue. We have, therefore, decided on a second notice. Sir Arthur Arnold distributed the prizes in the afternoon to the successful craftsmen in the handicrafts' competitions. The chair was taken by Professor Banister Fletcher, who remarked that the competitions in handicrafts had been most successful, and nearly 100 workmen had entered for them. Their object was to improve the standard of work for all schools and shops so as to benefit both the workman and the trade, and to enable this country to compete with foreign nations on more equal terms. Sir Arthur Arnold, after distributing the prizes, congratulated all concerned on the unqualified success of the Exhibition. The greatest industry in London was the building trade; more persons were engaged in or dependent on the trade than on any other. It was a matter of the highest importance that the trade should be carried on in an enlightened and intelligent manner, and since the work in the workshops was more mechanical than it used to be, it was good to afford them such opportunities as these to display their talent and ability. He liked the Exhibition the more because in many ways it concerned the health of London, which was a matter of interest to every one. Sanitary reform was once in a very different position to the one it held at present, but there was still further advance to be made, and he had seen examples in this Exhibition of what might be done in the future. In consequence of sanitary improvements life had been prolonged, but this was less important than the maintenance of a high standard of health. The recurrence of disease was the greatest evil, and, therefore, they should encourage such Exhibitions as these, and he hoped that all would co-operate in every useful manner for the advantage and welfare of this great city and its population.

### THE DELLA ROBBIÀ POTTERY COMPANY, LIMITED.

DELLA ROBBIÀ pottery, which, according to the late Lord Leighton, embodies "the application of artistic qualities to objects of ordinary domestic use," was to be seen in all its richly decorative forms at the Company's stand in the gallery. Della Robbia pottery and its artistic application is too well-known to need description; it is enough for us to mention that the exhibits included small panels for overmantels, sundials, and pedestals, bands of colour for dadolines, chimney sides, bands in rich-coloured relief, designs for tilings for window-garden boxes, large jardinières, &c. The pieces are all original, inasmuch as they are made by hand, and no two pieces are exactly the same. Mr. Harold Rathbone superintends the production of the pottery, which has won the appreciation of many leading Artists and Architects of the day.

### MESSRS. T. J. SYER AND COMPANY.

THE exhibits on Messrs. T. J. Syer and Company's stand ranged from laths to patent joiners' vices. These vices are instantaneous in their action in gripping or relaxing their hold in any distance 1-17in. to 13½in., and are always parallel when open. A patent mitre

camp, Syer's patent bench knife (the handle of which is placed in horizontal instead of a vertical position, and works the blade both ways by its action), wood-split pulleys, portable forges, telescope and folding ladders, were only a few of the many and varied exhibits on this stand.

### GEORGE JENNINGS.

THE well-known goods from the South Western Pottery—all made of the best Dorset clay—exhibited by George Jennings, attracted considerable attention during the week. Perhaps the exhibit claiming greatest attention was Tyndale's patent "double seal" jointed pipes. The joint was generally admitted to be perfect, and besides the material is homogeneous in texture, impermeable to water, and affords improved facilities for quick laying, testing, and covering in. Sink bends in glazed stoneware, highly glazed cane colour sinks, the "Parkstone" flush-down apparatus, patent and other invert blocks for brick sewers and glazed stoneware manhole bottoms, were included in the stock of sanitary accessories which is upon a stand—the largest at the firm's disposal—all too small to accommodate examples of the many goods with the production of which Mr. Jennings' name is so closely associated.

### MESSRS. STANLEY R. DOCKING AND COMPANY.

A VERY simple and efficient safety-valve was shown by Messrs. S. R. Docking and Co., of 62, Dingwall Road, Croydon. It cleverly surmounts many of the difficulties encountered with other valves, and among its advantages are a security from sticking or leakage, the abandonment of perishable washers, whilst it also requires no lead away pipe, thus obviating the risk of the same freezing up at the very time when most required, and rendering valves worse than useless. When relieving a sealed boiler, it does so by a simple puncture at the apex of the cone (without any complication of piercing by a needle) in a silent and harmless manner by the power and temperature increasing. The fact that whilst all other valves require attention, Messrs. Docking and Co.'s valve, when fixed, requires no attention whatever, is in itself an adequate reason for its preference over all others.

### MESSRS. PETERS, BARTSCH, AND CO.

MESSRS. PETERS, BARTSCH, AND CO., of Derby, and 68, Queen Street, E.C., had two or three specialties on show. The first was their patent wood preservative, Carbolineum Avenarius, which is claimed to be more effective than paint in preserving wood under and above ground, not only against wet and dry rot, but against the ravages of vermin. Secondly, they showed samples of their Antioxide, which as a rust protector and a protector of iron has been largely used by the Railway Companies. And patent indestructible combination washers for flange joints of steam and water pipes were also on the same stand. These washers have been tested up to 2300lb. pressure, and of their durability, therefore, there can be no doubt.

### MESSRS. POTTER AND CO. LIMITED.

STAND 14 consists of a model of Potter's patent fireproof floor, shown by Messrs. Potter and Co. Limited, of Victoria Street, Westminster, S.W. The floor is very light—it weighs 26lb. per footsuper—is partially fireproof, thoroughly sound-proof, is very strong, and in every respect sanitary. It is well-known that concrete conveys sound very readily; a suspended and independent ceiling is the only remedy, and Messrs. Potter obtain the desired results by the total disconnection of floor and ceiling. Double air spaces are introduced into the steel

joists as a fire preventative, and the bottom flanges are protected by fireclay flange-shields, which thus enable the flooring to resist fire for a very protracted period. Those who know the floor or who have inspected the model will readily admit that it has certain distinct advantages—advantages which the trade is recognising more fully every year, and hence an increasing demand for it.

### H. HART, COMMERCIAL ROAD, E.

MR. HART, who, according to catalogue arrangement, occupies the first stand in the Exhibition, shows almost every description of drain and sweep's tools, which include a patent spring lock joint and a patent push-in-socket joint.

### MESSRS. WEBB AND CO.

WITH, perhaps, one exception, the best collection of mosaic work was exhibited by Messrs. Webb and Co., of 292, Euston-road, N.W., who occupied a stand in the gallery. Marble mosaic pavements were numerous, but there were also to be seen examples of jewelled mosaic, a new and effective treatment of mosaic panels for friezes, facias, stall boards, pilasters, and mural decoration generally, which Messrs. Webb and Co. not long ago introduced into their business. By the use of tesserae, formed from the Company's enamelled and lustre tiles, with Venetian gold glass cubes, the exquisite and brilliant effects of jewellery are produced, beautiful by day, and especially resplendent by artificial light, which brings out a variety of iridescent gleams. Such a rich decoration, which has already been introduced into several well-known hotels, &c., must claim general appreciation.

### MESSRS. E. E. TWIGG AND COMPANY.

ON the stand of Messrs. E. E. Twigg and Company, of Ashford, near Bakewell, were several mantelpieces of marbles in rather unique shades, suitable for decorating with rare effect the interiors of either public or private buildings. There were also on exhibition turned marble columns and balusters, inlaid marble tables, marble tiles for flooring, marble slabs for well linings, &c. The marble was from the company's own quarries in Derbyshire, and it has been used in many important public buildings in the provinces.

### COLLANDER'S PURE BITUMEN DAMP-COURSE.

SEVERAL models were exhibited, showing the application of Collander's pure bitumen damp-course, firstly, to railway arch, secondly as lining for a reservoir, and thirdly, to a brick wall standing in water. Whilst samples were also shown as illustrating its application to vertical work finished with match-boarding, expanded metal, plaster, &c.

### MESSRS. JOHN KNOWLES AND CO.

AMONG their "Vitrifine" stoneware pipes and other sanitary goods, Messrs. J. Knowles and Co., of 38, King's Road, St. Pancras, N.W., showed the patent Anti-Vap street gully. As the trap is completely hidden from the action of the sun, evaporation is practically unknown, which thus ensures immunity from any offensive smell. The Aquarius closet, which, as explained elsewhere, is constructed so that the drain can be set off at any angle, was also exhibited, other goods on the stand including channel pipes for manholes, blue Staffordshire bricks, fire bricks, chimney pots, &c.

### MESSRS. J. ARMSTRONG AND SON.

MESSRS. J. ARMSTRONG AND SON show drain cleaning machines of all descriptions and in all sizes. They are manufacturers of improved

brass screw sockets for drain rods which, as exhibited on stand 17, are double rivetted and much longer in length and in thread than the ordinary rod. The latest improvements in chimney-sweeping machines are also shown.

#### CHARLES G. ROBERTS, HASLEMERE.

NEXT to Messrs. Armstrong's stand, Mr. Roberts shows an example of his patent rain-water separator. Its object is the purification of rain water. The rain washing the roof runs into a pipe connected with the drains, and when rain has fallen sufficiently to have carried away the dust and dirt off the roof, the water automatically is directed to a pipe connected with a tank, and thus nothing but that which is clean and wholesome is preserved.

#### THOS. KEMP, BRIXTON, S.W.

MR. KEMP's improved system of house drainage, shown at Stand 19, attracted considerable notice during the Exhibition. It embodies new inventions for rodding drains throughout from ground surface. A welcome feature of this system is that it obviates the necessity of costly manholes, whilst amongst other advantages, trench drains can be laid with only a shallow cutting. Kemp's patent intercepting traps were also exhibited, and showed pipes fitted for use with or without manholes, and also the mode of unstopping and dredging trap and unstopping pipes leading to the main sewer. Double ceiling inspection eye cover, and apparatus for supporting the same were among other exhibits on the stand.

#### THE PATENT CHIMNEY POT COMPANY, LIMITED.

THAT Peyton's patent "Champion" chimney pot is up-to-date no one will dispute. It has weathered the blasts in the most exposed parts of the kingdom, and, in addition to its stability, it offers no obstacle to the begrimed sweep as his brush can easily pass through the pot and remove soot without further attention. As compared with crows, pecuniarily, Peyton's "Champion" is cheaper.

#### MESSRS. RIGBY, BATTCOCK, AND COMPANY.

MESSRS. RIGBY, BATTCOCK AND COMPANY, of Bethnal Green Road, Shoreditch, showed a large collection of painting brushes and artists' tools of all sorts and sizes. Brass hand distemper brushes, copper locket varnish brushes and tools, and paint removing lamps were represented in the collection. The goods were clearly of very high class.

#### DURRANS' PATENT SYNDICATE.

DURRANS' patent self-cleaning galvanised iron cisterns, shown on Stand 28, are well worth a passing notice, as they supply a great need for a clean container to receive the household water for drinking purposes. The tank is circular in shape with a coned-dished bottom, and mounted on an iron-framed stand. The ball valve has a copper circular flushing pipe, so that when the valve is open all dirt and sediment is completely washed away. Where cisterns are situated inside roofs and other inaccessible places the valve can be fixed with a length of pipe to discharge over a sink below or in the bath-room, and thus no trouble is entailed in turning the valve on and off. The cistern is fixed with a galvanised iron cover, bolted down air tight to prevent any foul air contaminating the water. The cistern has much to recommend it. Durrans' Kallio metallic jointed air-tight cover for manhole chambers was also on exhibition.

#### D. C. SIMPSON, FOREST GATE E.

THE sash window seems to have claimed the inventors' attention a good deal lately. Mr. D. C. Simpson exhibited his patent on Stand 30, and it differs from other patents of the kind in that the ordinary sash frame is made to revolve within an outer one, built in brick-work, so that the whole of the sashes, frames, &c., can be completely reversed. Besides, by the removal of a single screw, the whole of the window-frame, with sashes, can be lifted bodily from its place; the advantages of these facilities are obvious, especially in

cases of lofty and dangerously placed windows. But in all buildings, whether domestic or public, they are a desirable acquisition.

#### THE EUREKA DISINFECTANT CO.

THE "Eureka" Automatic Disinfecting Cylinder, shown by the above Company on Stand 32A, is a useful invention which provides a new method of using disinfectants. It consists of a cylinder of porous cement filled with Crystals of Permanganate of Potash, Creosote, and Eucalyptus Oil, and the action of water on the cylinder converts it (the water) into a strong disinfectant.

#### THE CRANSTONE ENGINEERING WORKS, LIMITED, AND THE KENT ENGINEERING WORKS.

THE principal exhibit on Stand 37 was a self-sustaining, hand-power, dinner service lift. It was constructed on a very much improved principle, and became self-sustaining at any point directly the hauling rope was liberated. A hand-brake rope was, therefore, unnecessary. The same exhibitors also showed a very compact friction hoist—which could be fixed in any position—and a number of pulley blocks, quick rack hoists, &c.

#### A. E. PARNACOTT, JUN., LAMBETH, S.E.

A PNEUMATIC water waste preventing flushing cistern, which occupied Stand 38, shown by Mr. A. E. Parnacott, jun., 33, Finch Street, Westminster Bridge Road, Lambeth, S.E., was one of the novelties of the Exhibition. It obviates all chance of overflowing, and this without a ball valve! In a few words, the invention is this: water is supplied direct from the main to the cylinder, and when it begins to empty, compresses the air; this compression of air increases until it overcomes the force from the main. Then, when the valve is open and the water finds an outlet, the air begins at once to expand, and its power in the direction where there is the least resistance, which is, of course, the valve, results in an extraordinary flush.

#### T. M. ROBERTS, FINSBURY CIRCUS, E.C.

ODDY's patent automatic bell, shown by Mr. Roberts on Stand 40, seemed effective enough to rouse all Islington. The difficulties of the enterprising burglar bid fair to be increased. But Mr. Roberts did not only exhibit alarm bells. He showed door bells, and bells for general use all of which work automatically, by means of a strong spring which thus does away with the sensitive battery and all the ills to which it is heir. It is not difficult to believe, therefore, that these automatic bells are in great demand; their simplicity and effectiveness ensure popularity.

#### MESSRS. J. C. BROADBENT AND CO., LIMITED.

MESSRS. J. C. BROADBENT AND CO., LIMITED, of 73, Basinghall Street E.C., exhibited a model of a building showing various methods of applying silicate cotton or slag wool, and also patterns illustrating the application of the material more in detail for building and other purposes. The merits of silicate cotton are well known. It is a pure mineral fibre made from iron slag, and besides being very light, is sound, fire, frost, and vermin proof. Messrs Broadbent also exhibited their hair fabric, which is made similarly to slag wool and is for similar purposes.

#### THOMAS POTTERTON, BALHAM, S.W.

THE principal exhibit on Mr. Potterton's stand was an example of his patent range boiler for supplying large quantities of hot-water and warming houses from the kitchen fire in conjunction with the hot-water domestic supply. It fulfils its dual capacity admirably, for its heating powers are enhanced by utilising the large percentage of heat wasted in an ordinary fire. Other notable exhibits on the same stand were Potterton's patent indicating safety valves, which are fitted with hollow spindles and attachable cocks, and an example of a kitchen range with a rising bottom for diminishing the heat when not required.

#### MESSRS. KING AND SON, WEEDON.

MUCH praise has been bestowed upon Messrs. King and Son for their "Honeycomb" wine-bin, as shown on Stand 51. Certainly in construction it has the charm of novelty. Each receptacle for a bottle is a separate tube, made of terra-cotta, hexagon or honeycomb shape outside, and circular within. Thus each bottle having a separate chamber, is protected from currents of air, and, to a great extent, sudden changes of temperature, whilst the bin is durable and cheap. It can be built into the walls of houses, making the cellar a foot larger each way.

#### MOULE'S PATENT EARTH CLOSET COMPANY, LIMITED.

THE Company had on exhibition examples of all their patent closets, including Moule's pull-up earth closet apparatus, Moule's self-acting earth closet apparatus, and Moule's pull-up portable closet, &c. The system, which is founded on the now well-known power possessed by dry earth, of deodorising and disinfecting fecal matter, is applicable not only to new closets, but to most existing closets, and is to be strongly recommended, as its employment effectually remedies all the evils attendant on common cesspool privies, &c.

#### MAURICE'S PORCELEINE CO., LTD.

THERE was a great profusion of Maurice's porcelaine on Stands 64 and 65. It was shown applied to figures and to Anaglypta with a very bright and pleasing effect. It gave a china-like surface, and it is claimed for the porcelaine that it is an effectual preventative of damp walls, and will resist the action of hot water in the same way as stove japan. It is prepared in any colour, and by the Company's process of manufacture the most delicate tints are obtained. It is claimed that it is superior in effect and durability to four of ordinary paint or enamel.

#### MESSRS. FRED JONES AND COMPANY.

MESSRS. FRED JONES AND CO., of Perren Street, Rylands Road, Kentish Town, N.W., exhibited silicate cotton or slag wool in a loose state and in various made up forms for use in buildings. Jones's patent combination slab which is composed of a plaster slab lined with silicate cotton, is put forward as a substitute for heavy girders. Fibrous plaster slabs and Jones's patent damp proof slabs were also shown, and it may be mentioned that the former has been considerably in demand by London builders.

#### THE LONDON OPAL TILE AND DECORATION COMPANY.

THE new patent Opal tiles for wall and general decorative purposes was shown in varied treatments on Stand 68. The tiles are made with a pure Opal surface, and their great feature is a patent cemented back which greatly facilitated the fixing. The tiles have a superior finish, and equal in appearance—but not in price—glazed bricks and glazed tiles, whilst they also possess the advantage of suitability to all climates, readily allowing for expansion and contraction. The Company showed an example of Opal tiles on ordinary walls, which strikingly represented enamelled bricklaying, and it was shown with what ease repairs could be executed in case of a tile becoming chipped or broken.

#### MESSRS. H. AND F. BONTEN.

A VERY varied and interesting collection of wrought-iron mouldings for Architectural purposes was shown by Messrs. H. and F. Bonten, of Elder Street, Norton Folgate, E. If it does nothing else, the collection forcibly illustrates the progress Art metal work has made during recent years; and by the goods exhibited by Messrs. Bonten, Architectural effects of a very high character are easily attained. A novelty on the stand was examples of self-contained sections for the construction of shop front windows, with roller blind channels attached, and by an ingenious introduction of ornamental iron mouldings the glazing frame is effected, and you have at once a fireproof, ornamental, and well-ventilated wrought-iron window. Another exhibit out of the ordinary

was examples of patent, twisted, ornamental, wrought-iron hollow tubes or banister iron, made in sections, whilst numerous other sections for Art metal work were also shown, claiming lightness, indestructibility, and cheapness as their chief advantages.

#### MESSRS. D. ANDERSON AND SON, LIMITED.

FELTS for all purposes were shown on Messrs. D. Anderson and Son's stand, a feature of which was a segmental lattice girder specially made for the roofing of sheds. Other models showed the application of silicate cotton for deadening sound and fireproofing buildings; the use of Anderson's patent hair fabric for covering hot and cold water pipes to prevent freezing; and also silicate cotton as a covering for pipes. All kinds of india-rubber goods used in the building and allied trades were also on exhibition.

#### PEASE'S TUBULAR CONSTRUCTION SYNDICATE, LIMITED.

A NON-METALLIC portable house with specimens of fireproof flooring were the chief exhibits of Pease's Tubular Construction Syndicate, Limited, of Stockton-on-Tees. These portable houses are constructed in panels, the connecting and strengthening members being open joint tubes, which engage with light angle strips fastened to the sides of the panels. Structures erected on this system are light and rigid, and possess a highly finished appearance. The flooring is of galvanised steel and wood for all spans, and is made in a cylindrical form, engaging with tongued and grooved boarding, the whole drawn together in sections by through bolts. The beam-like structure of the ironwork gives it strength enough to stand the most severe tests.

#### MESSRS. C. G. PICKING AND CO.

"MAXIMUM of strength with minimum of weight and thickness" is what Messrs. C. G. Picking and Company, of Bounds Green Works, New Southgate, N., claim for their interlocking fireproof flooring. These *desiderata* have been secured by adapting to hollow tubular blocks the twin arch design, combined with the employment of a strong and refractory material in manufacture. Additional strength is given by the lateral interlocking arrangement, and, therefore, concrete has not to be employed. The double-arched blocks need only the covering of fire-resisting grout in order to form a homogeneous floor. Another important point is that the floor does not exceed six inches in depth; its value in economising head space must be readily appreciated. At the same time, a heavier or thicker floor is quite possible if required. Messrs. Picking also exhibited an example of their interlocking fire and sound-proof partitioning, the walls of which, when plastered and finished, are only about three inches in thickness. It is therefore very light, and at the same time extremely strong.

#### MESSRS. G. AND J. HAIGH.

MESSRS. G. AND J. HAIGH, of Dewsbury, showed an extensive collection of bricks—firebricks, glazed bricks, and building bricks—and sinks and sanitary ware generally, made from clay brought up from mines of which they are the proprietors. This enables them to put their goods on the market at a low rate, and at the same time the quality of the material is such as to produce bricks that have been proved equal to severe tests. They also showed some buff and red floor tiles.

#### PATENT WINDOW COMPANY.

NORFOLK's improved sash windows have been designed with due regard to the exigencies of an outbreak of fire. In such a case, both sashes can be opened inside the room in the space of half a minute. Each sash works independently, and can be turned inwards on hinges. New sash lines can be replaced without the removal of the beading, and the windows are fitted with the screw rope coupler, which has been introduced as an improvement on the present style of tacking on sash cords. Mr. Norfolk's address is Brockley Road, Brockley, S.E.

#### MESSRS. F. WALTON AND COMPANY.

LINCROSTA WALTON has been so long before the public, and has met with such wide appreciation, that little remains to be noted beyond the fact of the exhibit. Quite in a fitting manner Messrs. F. Walton and Company determine to maintain their position—hence an exhibit of excellent designs and corresponding workmanship. The season bids fair to be one of great activity in all branches of building and decorative Art, and Lincrosta Walton is to the fore with a singularly effective range of patterns. We append one of the current designs for a dado, which may seem to illustrate the play of fancy and grace of manner which form so marked a characteristic of the Lincrosta

#### MESSRS. DIESPEKER AND CO.

AN interesting exhibition of mosaic work was made by Messrs. Diespeker and Company, of 60, Holborn Viaduct, E.C., on Stand 89A. Examples of Roman and Venetian marble mosaic for floors, dados, wall decoration, hearths, pathways, &c., made a very good collection, which recommended itself to the trade on practical as well as artistic grounds, for it is well known that mosaic adds strength to concrete foundations, and is especially desirable on sanitary grounds. Circular mosaic skirting and channels specially suitable for wards, corridors, baths, &c., were also shown, all the work having been done by Messrs. Diespeker, who do not import mosaic from abroad.

DESIGN BY MESSRS. F. WALTON AND CO.
